For load-sharing mirrors, a change to a property affects all of the SnapMirror relationships in the set

of load-sharing mirrors. Destination volumes in a set of load-sharing mirrors do not have individual property settings.

Changes made by the `snapmirror modify` command do not take effect until the next manual or scheduled update of the SnapMirror relationship. Changes do not affect updates that have started and have not finished yet.

This command is supported for SnapMirror relationships with the field **"Relationship Capability"** showing as either **"8.2 and above"** or **"Pre 8.2"** in the output of the `snapmirror show` command.

The `snapmirror modify` command must be used from the destination Vserver or cluster.

## Parameters

{ [-S, -source-path

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form **hostip:/share/share-name**. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form **hostip:/lun/name**.

| [-source-cluster <cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**. This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>] - Source Volume }

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ -destination-path

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form **hostip:/share/share-name**. For relationships with SolidFire destinations, the destination endpoint is specified in the form **hostip:/lun/name**.

#### **[`-destination-cluster <Cluster name>`] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **`-destination-vserver`** and **`-destination-volume`** must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**. This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**.

#### **`-destination-vserver <vserver name>` - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **`-destination-volume`** and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, **`-destination-cluster`** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **`-destination-volume <volume name>` - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **`-destination-vserver`** and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, **`-destination-cluster`** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **`-vserver <vserver name>`] - Managing Vserver**

If this optional parameter is specified, designates the managing Vserver. The managing Vserver is authorized to use some snapmirror commands to manage the SnapMirror relationship. The **`-vserver`** option is currently a reserved option.

#### **`-schedule <text>`] - SnapMirror Schedule**

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationship. If you do not designate a schedule, updates are not scheduled, so you must update the SnapMirror relationship manually using the [snapmirror update](#) command or, in the case of a set of load-sharing mirrors, using the [snapmirror update-ls-set](#) command.

You define and name a schedule using the [job schedule cron create](#) command.

#### **`-policy <sm_policy>`] - SnapMirror Policy**

This optional parameter designates the name of the snapmirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. Modification of the policy is not supported for relationships with a policy of type **`strict-sync-mirror`** or **`sync-mirror`**. If you want to use a different policy for SnapMirror Synchronous relationships, you need to delete the relationship and create it again with the new policy. This parameter is not applicable to relationships with **"Relationship Capability"** of **"Pre 8.2"**.

You define and name a policy using the `snapmirror policy create` command.

### `[-tries <unsigned32_or_unlimited>] - Tries Limit`

This optional parameter specifies the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The default is eight times. The `-tries` parameter can be set to `0` to disable manual and scheduled updates for the SnapMirror relationship. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2". For relationships with "8.2 and above" capability, the tries limit is controlled by the value of tries in the SnapMirror policy that is associated with the relationship.

### `[-k, -throttle <throttleType>] - Throttle (KB/sec)`

This optional parameter limits the network bandwidth used for transfers. It configures for the relationship the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationship fully utilizes the network bandwidth available. You can also configure the relationship to fully use the network bandwidth available by explicitly setting the throttle to `unlimited` or `0`. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between `1` and `4`, it will be treated as `4`. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship. The `-throttle` parameter does not affect load-sharing mirrors and other SnapMirror relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

### `[-is-auto-expand-enabled {true|false}] - Is Auto Expand Enabled`

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If you do not specify the parameter, the current value of auto expand will be retained.

### `[-w, -foreground <true>] - Foreground Process`

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".

## Examples

To change the schedule to `halfhour` for the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror2`, type the following command:

```
vs2.example.com::> snapmirror modify -destination-path  
vs2.example.com:dept_eng_dp_mirror2 -schedule halfhour
```

For relationships with "Relationship Capability" of "Pre 8.2", to change the schedule to `halfhour` for the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_dp_mirror2`, type the following command:

```
cluster2::> snapmirror modify -destination-path
```

```
cluster2://vs2.example.com/dept_eng_dp_mirror2
-schedule halfhour
```

To change the schedule to **halfhour** for the Vserver SnapMirror relationship with destination endpoint **dvs1.example.com:** , type the following command:

```
cluster2::> snapmirror modify -destination-path
dvs1.example.com: -schedule halfhour
```

# snapmirror promote

Promote the destination to read-write

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror promote** command performs a failover to the destination volume of a SnapMirror relationship. This command changes the destination volume from a read-only volume to a read-write volume and makes the destination volume assume the identity of the source volume. The command then destroys the original source volume. The destination volume must be a load-sharing volume. Note that you can promote a load-sharing volume that has been left in read-write state by a previously failed promote operation.

Client accesses are redirected from the original source volume to the promoted destination volume. The view clients see on the promoted destination volume is the latest transferred Snapshot copy, which might lag behind the view clients had of the original source volume before the promote.

The SnapMirror relationship is always deleted as part of the promotion process.

It is possible that the original source volume is the source of multiple SnapMirror relationships. For such a configuration, the promoted destination volume becomes the new source volume of the other SnapMirror relationships.

This command is only supported for SnapMirror relationships with the field **"Relationship**

**Capability**" showing as **"Pre 8.2"** in the output of the `snapmirror show` command.

The `snapmirror promote` command fails if a SnapMirror transfer is in progress for any SnapMirror relationship with **"Relationship Capability"** of **"Pre 8.2"** involving the original source volume. It does not fail if a SnapMirror transfer is in progress for a relationship with **"Relationship Capability"** of **"8.2 and above"**.

## Parameters

{ [-S, -source-path

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form **hostip:/share/share-name**. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form **hostip:/lun/name**.

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**. This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>] - Source Volume }

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ -destination-path

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used

when operating in a Vserver context on relationships with "**Relationship Capability**" of "**8.2 and above**". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form **hostip:/share/share-name**. For relationships with SolidFire destinations, the destination endpoint is specified in the form **hostip:/lun/name**.

#### **[`-destination-cluster <cluster name>`] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with "**Relationship Capability**" of "**Pre 8.2**". This parameter cannot be specified when operating in a Vserver context on relationships with "**Relationship Capability**" of "**8.2 and above**".

#### **`-destination-vserver <vserver name>` - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with "**Relationship Capability**" of "**Pre 8.2**", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **`-destination-volume <volume name>` - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with "**Relationship Capability**" of "**Pre 8.2**", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **`[-f, -force <true>]` - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

## Examples

To promote a mirror named `vs1_root_ls1` to be the source read-write volume for mirroring and client access, type the following command:

```
cluster1::> snapmirror promote -destination-path
//vs1.example.com/vs1_root_ls1
-source-path //vs1.example.com/vs1_root -f true
```

- [snapmirror show](#)

# snapmirror protect

Start protection for Vservers and volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege

level.

## Description

The **snapmirror protect** command establishes SnapMirror protection for the specified Vserver or a list of volumes. For each endpoint, the command creates a data protection destination endpoint in the Vserver specified by the **-destination-vsriver** parameter, creates an extended data protection (XDP) SnapMirror relationship, and starts the initialization of the SnapMirror relationship. This command must be used from the destination Vserver or cluster. This command is not supported for FlexGroup volume constituents or non ONTAP endpoints. When source volumes are specified they must be read-write (RW) volumes.

## Parameters

### **[-source-cluster <Cluster name>] - Source Cluster**

This optional parameter specifies the source cluster name. This parameter is valid only when only a single Vserver is specified in the path-list parameter.

### **-path-list**

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Path List

This parameter specifies the list of source endpoints to be protected. The list is a comma separated list of paths of the form **vserver:volume** or **vserver:** , for example **vs1.example.com:dept\_eng1**, **vs1.example.com:dept\_eng2** or **vs1.example.com:** . If the list contains a Vserver endpoint, then the Vserver is the only endpoint that can be specified, and the list cannot contain a mixture of volume and Vserver endpoints.

### **[-destination-vsriver <vserver name>] - Destination Vserver**

This parameter specifies the Vserver in which to create the destination volumes of the SnapMirror relationships. When protecting a single Vserver, this parameter specifies the destination Vserver endpoint for protection.

### **[-destination-vsriver-ipspace <IPspace>] - Destination Vserver IPspace Name**

This optional parameter specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace. This parameter is supported while protecting a Vserver.

### **[-schedule <text>] - SnapMirror Schedule**

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationships.

### **-policy <sm\_policy> - SnapMirror Policy**

This parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationships.

### **[-auto-initialize {true|false}] - Auto Initialize**

This optional parameter specifies whether or not initializes of the SnapMirror relationships should

be started after the relationships are created. The default value for this parameter is **true** .

#### **[-destination-volume-prefix <text>] - Destination Volume Name Prefix**

This optional parameter designates the prefix for the destination volume name. For example if the source path is of the form **vserver:volume** and the destination-volume-prefix specified is **prefix** and no destination-volume-suffix is specified, then the destination volume name will be **\_prefix\_volume\_dst** or possibly **prefix\_volume\_1\_dst** if a name conflict is encountered. If both prefix and suffix are specified as **prefix** and **\_\_suffix** , then the destination volume name will be **prefix\_volume\_suffix** or **prefix\_volume\_1\_suffix** , if a name conflict is encountered. This parameter is not supported for Vserver endpoints.

#### **[-destination-volume-suffix <text>] - Destination Volume Name Suffix**

This optional parameter designates the suffix for the destination volume name. If you do not designate a suffix, a destination volume name with suffix **dst\_** will be used. For example if the source path is of the form **vserver:volume** , and the suffix specified is **DP\_** , the destination volume will be created with the name **volume\_DP** or **volume\_1\_DP** if a name conflict is encountered. If both prefix and suffix are specified as **prefix** and **suffix** , then the destination volume name will be **prefix\_volume\_suffix** or **prefix\_volume\_1\_suffix** , if a name conflict is encountered. This parameter is not supported for Vserver endpoints.

#### **[-support-tiering {true|false}] - Provision Destination Volumes on FabricPools**

This optional parameter specifies whether or not FabricPools are selected when provisioning a FlexVol volume or a FlexGroup volume during protection workflows. When this parameter is set to true, only FabricPools are used; when set to false, only non-FabricPools are used. Tiering support for a FlexVol volume can be changed by moving the volume to the required aggregate. Tiering support for a FlexGroup volume can be changed by moving all of the constituents to the required aggregates. The default value is **false** . This parameter is supported only for FlexVol volumes and FlexGroup volumes.

#### **[-tiering-policy <Tiering Policy>] - Destination Volume Tiering Policy**

This optional parameter specifies the tiering policy to apply to the destination FlexVol volume or FlexGroup volume. This policy determines whether the user data blocks of a FlexVol volume or FlexGroup volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. The default tiering policy is 'snapshot-only' for a FlexVol volume and 'none' for a FlexGroup volume. The temperature of a FlexVol volume or FlexGroup volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- snapshot-only - This policy allows tiering of only the FlexVol volume or FlexGroup volume Snapshot copies not associated with the active file system. The default minimum cooling period is 2 days. The **-tiering-minimum-cooling-days** parameter can be used to override the default using the **volume modify** command after the destination FlexVol volume or FlexGroup volume has been created.
- auto - This policy allows tiering of both snapshot and active file system user data to the capacity tier. The default cooling period is 31 days. The **-tiering-minimum-cooling-days**

parameter can be used to override the default using the **volume modify** command after the destination FlexVol volume or FlexGroup volume has been created.

- none - FlexVol volume or FlexGroup volume blocks will not be tiered to the capacity tier.
- backup - On a DP FlexVol volume or FlexGroup volume this policy allows all transferred user data blocks to start in the capacity tier.

This parameter is supported only for FlexVol volumes and FlexGroup volumes.

## Examples

To establish SnapMirror protection for the source volumes **vs1.example.com:dept\_eng1** and **vs1.example.com:dept\_eng2** using destination-vserver **vs2.example.com** and policy **MirrorAllSnapshots** type the following command:

```
vs2.example.com::> snapmirror protect -path-list
vs1.example.com:dept_eng1,vs1.example.com:dept_eng2 -destination-vserver
vs2.example.com -policy MirrorAllSnapshots
```

To establish SnapMirror protection for the source Vserver **vs1.example.com** which is on cluster **cluster1** creating a destination-vserver named **vs1dp.example.com** and using policy **MirrorAllSnapshots** type the following command:

```
cluster2::> snapmirror protect -source-cluster cluster1 -path-list vs1.example.com:
-destination-vserver vs1dp.example.com -policy MirrorAllSnapshots
```

## snapmirror quiesce

Disable future transfers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror quiesce** command disables future transfers for a SnapMirror relationship. If there is no transfer in progress, the relationship becomes **"Quiesced"**.

If there is a transfer in progress, it is not affected, and the relationship becomes **"Quiescing"** until the transfer completes. If the current transfer aborts, it will be treated like a future transfer and will not restart.

If applied to a load-sharing (LS) SnapMirror relationship, all the relationships in the load-sharing set will be quiesced.

If applied to a relationship with a policy of type **strict-sync-mirror** or **sync-mirror**, any ongoing

operation is aborted, and if the relationship is InSync, synchronous replication is stopped. If the replication policy type is "strict-sync-mirror", then the primary client I/O disruption is not enforced. A new common Snapshot copy is created if the relationship is InSync, unless a recent one exists. The relationship becomes **"Quiescing"** until these operations complete.

When a SnapMirror relationship is quiesced, it remains quiesced across reboots and fail-overs.

This command is supported for SnapMirror relationships with the field **"Relationship Capability"** showing as either **"8.2 and above"** or **"Pre 8.2"** in the output of the `snapmirror show` command.

This command is not supported for SnapMirror Business Continuity (SMBC) relationships with policy of type **automated-failover** .

The `snapmirror quiesce` command must be used from the destination Vserver or cluster.

The relationship must exist on the destination Vserver or cluster. When issuing `snapmirror quiesce` , you must specify the destination endpoint. The specification of the source endpoint of the relationship is optional.

## Parameters

{ [-S, -source-path

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"** , a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"** . For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form **hostip:/share/share-name** . For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form **hostip:/lun/name** .

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"** . This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"** .

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with **"Relationship Capability"** of **"Pre 8.2"** , **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>] - Source Volume }

Specifies the source volume of the SnapMirror relationship. If this parameter is specified,

parameters **-source-vserver** and for relationships with **"Relationship Capability"** of **"Pre 8.2"** , **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

### { -destination-path

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"** , a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"** . For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form **hostip:/share/share-name** . For relationships with SolidFire destinations, the destination endpoint is specified in the form **hostip:/lun/name** .

### [ [-destination-cluster <cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"** . This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"** .

### -destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with **"Relationship Capability"** of **"Pre 8.2"** , **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

### -destination-volume <volume name> - Destination Volume }

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with **"Relationship Capability"** of **"Pre 8.2"** , **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

## Examples

To quiesce the SnapMirror relationship with the destination endpoint **vs2.example.com:dept\_eng\_mirror2** , type the following command:

```
vs2.example.com::> snapmirror quiesce -destination-path
vs2.example.com:dept_eng_mirror2
```

For relationships with **"Relationship Capability"** of **"Pre 8.2"** , to quiesce the SnapMirror relationship with the destination endpoint **cluster2://vs2.example.com/dept\_eng\_mirror2** , type the following command:

```
cluster2::> snapmirror quiesce -destination-path
cluster2://vs2.example.com/dept_eng_mirror2
```

To quiesce the Vserver SnapMirror relationship with the destination endpoint **dvs1.example.com:** , type the following command:

```
cluster2::> snapmirror quiesce -destination-path
dvs1.example.com:
```

## Related Links

- [snapmirror show](#)

# snapmirror release

Remove source information for a SnapMirror relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror release** command removes the relationship information from the source Vserver. The command also removes any Snapshot copy owner tags and any Snapshot copies which were created for the specified relationship from the source volumes. It does not destroy any volumes or Vservers. This command must be used from the source Vserver or cluster.

For relationships with a policy of type **strict-sync-mirror** , it additionally resumes primary volume access if the IO was restricted because the relationship was OutOfSync.

You can use the [snapmirror list-destinations](#) command to display source Vservers' relationship information. This information is populated during the first SnapMirror transfer, not when the [snapmirror create](#) command is issued.

This command is not supported for SnapMirror relationships with the field **"Relationship Capability"** showing as **"Pre 8.2"** in the output of the [snapmirror show](#) command.

This command is not supported for SnapMirror relationships with non-Data ONTAP endpoints.

The **snapmirror release** operation fails if a SnapMirror transfer for the SnapMirror relationship is in a data phase of the transfer.

## Parameters

**{ [-S, -source-path****{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path**

Specifies the source endpoint of the SnapMirror relationship in one of two formats. The normal format includes the names of the Vserver (vserver), and/or volume (volume). A format which also includes the name of the cluster (cluster) is also provided for consistency with other snapmirror commands. The form of the pathname which includes the cluster name cannot be used when operating in a Vserver context.

**[-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameter **-source-volume** must also be specified.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameter **-source-vserver** must also be specified.

**{ -destination-path****{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path**

Specifies the destination endpoint of the SnapMirror relationship in one of two formats. The normal format includes the names of the Vserver (vserver), and/or volume (volume). A format which also includes the name of the cluster (cluster) is also provided for consistency with other snapmirror commands. The form of the pathname which includes the cluster name cannot be used when operating in a Vserver context.

**[-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameter **-destination-volume** must also be specified.

**[-destination-volume <volume name>] - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameter **-destination-vserver** must also be specified.

**[-relationship-info-only <true>] - Remove relationship info only (skip cleanup of snapshots)**

If this parameter is specified, the cleanup of Snapshot copies is bypassed and only the source relationship information is removed. It is recommended to specify this parameter only when the source volume is not accessible.

**[-relationship-id <UUID>] - Relationship ID**

This optional parameter specifies the relationship identifier of the relationship. It must be specified when information for more than one relationship with the same source and destination paths is present. This parameter is not supported for Vserver SnapMirror relationships.

**[-f, -force <true>] - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

## Examples

To release the source information for the SnapMirror relationship with the destination endpoint **vs2.example.com:dept\_eng\_dp\_mirror4**, type the following command:

```
vs1.example.com::> snapmirror release
    -destination-path vs2.example.com:dept_eng_dp_mirror4
```

To release the source information for the SnapMirror relationship with the destination endpoint **vs2.example.com:dept\_eng\_dp\_mirror4**, and relationship-id **5f91a075-6a72-11e1-b562-123478563412**, type the following command:

```
vs1.example.com::> snapmirror release
    -destination-path vs2.example.com:dept_eng_dp_mirror4
    -relationship-id 5f91a075-6a72-11e1-b562-123478563412
```

To release the source information for the SnapMirror relationship with the destination endpoint **dvs1.example.com:**, type the following command:

```
cluster1::> snapmirror release
    -destination-path dvs1.example.com:
```

To release the SMBC relationship with the destination Consistency Group **cg\_dst** in Vserver **vs2.example.com** and the source Consistency Group **cg\_src** in Vserver **vs1.example.com**, type the following command from the source cluster:

```
source::> snapmirror release
    vs2.example.com:/cg/cg_dst
```

## snapmirror restore

Restore a Snapshot copy from a source volume to a destination volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror restore** command restores the entire contents of a Snapshot copy or one or more files, LUNs or NVMe namespaces of a Snapshot copy from one volume to another volume.

The source of the restore can be a volume that is:

- the destination volume of a extended data protection (XDP) relationship
- the destination volume of a data protection (DP) relationship with "**Relationship Capability**" of "**8.2 and above**"
- a data-protection volume which is not the destination endpoint of any SnapMirror relationship
- a read-write volume.
- an AltaVault endpoint. In this case the destination must be an empty Data ONTAP volume.

The following cannot be used as either the source or destination volume of a restore:

- a volume that is the source or destination endpoint of a SnapMirror load-sharing relationship.
- a volume that is the destination endpoint of a SnapMirror relationship with the "**Relationship Capability**" of "**Pre 8.2**".
- a SolidFire endpoint.

A SnapMirror relationship of type **RST** is created from the source volume to the destination volume by the **snapmirror restore** command. This relationship lasts for the duration of the restore operation and is deleted when the command completes successfully.

The following paragraphs describe the behavior when restoring the entire contents of a Snapshot copy to a destination volume.

By default the **snapmirror restore** will copy the latest Snapshot copy from the source volume to the destination volume. A specific Snapshot copy can be selected with the **-source-snapshot** parameter.

Any quota rules defined for the destination volume are deactivated prior to restoring the entire contents of a Snapshot copy. Run the command `volume quota modify -vserver destination-volume-vserver -volumed destination-volume-name -state on` to reactivate quota rules after the entire contents of the Snapshot copy have been restored.

If the destination volume is an empty data protection volume, the **snapmirror restore** command performs a baseline restore. For a baseline restore the following steps are performed:

- Create the **RST** SnapMirror relationship.
- The entire contents of the Snapshot copy selected to be restored are copied to the active file system of the destination volume.
- The destination volume is made read-write.
- The **RST** SnapMirror relationship is deleted.

If the destination volume is a read-write volume, an incremental restore is performed. The

incremental restore fails if it cannot find a common Snapshot copy between the source and destination volumes. Restoring a Snapshot copy to an empty read-write volume is not supported. Incremental restore from a non-Data ONTAP endpoint to a Data ONTAP volume is not supported.

An incremental restore preserves all Snapshot copies on the destination volume but does not preserve changes to the active file system since the latest Snapshot copy. To preserve changes to the destination volume since the latest Snapshot copy use the [volume snapshot create](#) command. Restore is a disruptive operation so client access of the destination volume is not advised for the duration of the operation.

For an incremental restore the following steps are performed:

- Create the **RST** SnapMirror relationship.
- The active file system of the destination volume is reverted to the latest Snapshot copy on the destination volume and the destination volume is made read-only.
- This Snapshot copy is the exported Snapshot copy and it is the view to which clients are redirected when accessing the destination volume.
- The contents of the Snapshot copy selected to be restored are copied to the active file system of the destination volume.
- The destination volume is made read-write.
- The **RST** SnapMirror relationship is deleted.

If **snapmirror restore** fails or is aborted, the **RST** relationship remains. Use the [snapmirror show](#) command with the destination volume name to display the reason for the error. An EMS is also generated when a failure occurs. There are two options to recover when restore fails or is aborted:

- Take corrective action suggested by the EMS and reissue the original command.
- Use the original command with **-clean-up-failure** to cancel the request.

When specifying **-clean-up-failure** to cancel an incremental restore request, the following steps are performed:

- If the Snapshot copy has not been restored to the destination volume, all data copied to the active file system by **snapmirror restore** to the destination volume is reverted.
- The destination volume is made read-write.
- The **RST** SnapMirror relationship is deleted.

When specifying **-clean-up-failure** to cancel a baseline restore request, the following steps are performed:

- If the Snapshot copy has been restored to the destination volume, the volume is made read-write.
- The **RST** SnapMirror relationship is deleted.

The following paragraphs describe the behavior and requirements when restoring one or more files, LUNs or NVMe namespaces to the destination volume.

The destination volume must be a read-write volume. Restoring files, LUNs or NVMe namespaces to a data protection volume is not supported. When restoring files, LUNs or NVMe namespaces the source and destination volumes are not required to have a common Snapshot copy. If a common Snapshot copy exists, an incremental restore is performed for those files, LUNs or NVMe namespaces being restored which exist in the common Snapshot copy.

The contents of the files, LUNs or NVMe namespaces to which data is being restored on the destination volume are not preserved by this command. To preserve the contents of the destination files, LUNs or NVMe namespaces, create a Snapshot copy on the destination volume prior to running this command. Client I/O is not allowed to a file, LUN or NVMe namespace to which data is being restored on the destination volume.

The **-source-snapshot** parameter is required when restoring files, LUNs or NVMe namespaces. It identifies the Snapshot copy on the source volume from which the files, LUNs or NVMe namespaces to be restored are copied. If all files, LUNs or NVMe namespaces to be restored do not exist in this Snapshot copy the command fails.

The source path for each file, LUN or NVMe namespace being restored is required. The source path of a file, LUN or NVMe namespace is from the root of the source Snapshot copy of the source volume. The file is restored to the same path on the destination volume unless an optional destination path is specified. The destination path is from the root of the destination volume. If a file, LUN or NVMe namespace to which data is being restored on the destination volume does not exist, the file, LUN or NVMe namespace is created. If any directory in the path of the file, LUN or NVMe namespace being restored does not exist on the destination volume, the command fails. Overwriting the contents of an existing file with the contents of a different file is supported. Similarly, overwriting the contents of an existing LUN or NVMe namespace with the contents of a different LUN or NVMe namespace is supported. However, overwriting a file with the contents of a LUN or NVMe namespace is not supported. Overwriting a LUN with the contents of a file or NVMe namespace is not supported. Overwriting an NVMe namespace with the contents of a file or LUN is not supported. Client I/O is not allowed to all files, LUNs and NVMe namespaces to which data is being restored on the destination volume.

If quota rules have been defined for the destination volume, resource usage is updated during file restore, but limits of quota rules are not enforced. Therefore, resource limits might be exceeded during a file restore.

Multiple concurrent **snapmirror restore** commands, restoring one or more files, LUNs or NVMe namespaces to the same destination volume, are not supported. The destination volume of a **snapmirror restore** to which one or more files, LUNs or NVMe namespaces are being restored, can simultaneously be the source volume of a [snapmirror update](#).

For a file, LUN or NVMe namespace restore the following steps are performed:

- Create the **RST** SnapMirror relationship.
- If any file, LUN or NVMe namespace being restored does not exist on the destination volume, create all such files, LUNs or NVMe namespaces.
- Prevent client I/O to files, LUNs or NVMe namespaces to which data is being restored on the destination volume.

- Revoke locks and space reservations held by NAS clients for files being restored.
- Copy the contents of all source files, LUNs or NVMe namespaces to the corresponding file, LUN or NVMe namespace on the destination volume.
- Allow client I/O to files, LUNs or NVMe namespaces to which data has been restored on the destination volume.
- Delete the **RST** SnapMirror relationship.

Some file restore operations require a Snapshot copy to be created. This Snapshot copy is temporary, it is deleted before the operation completes.

Since client I/O is not allowed to files, LUNs or NVMe namespaces being restored, client I/O to files, LUNs or NVMe namespaces being restored should be quiesced. Mapped LUNs or NVMe namespaces remain mapped throughout the operation. SAN clients do not need to rediscover a mapped LUN that has been restored. Restoring an NVMe namespace on top of another NVMe namespace with a different attribute relevant to NVMe protocol accessibility (like size) is not supported.

If **snapmirror restore** fails or is aborted, the **RST** relationship remains. Use the [snapmirror show](#) command with the destination volume to display the reason for the error. An EMS is also generated when a failure occurs. There are two options to recover when restore fails or is aborted:

- Take corrective action suggested by the EMS and reissue the original command.
- Use **snapmirror restore`-clean-up-failure`** along with specifying the destination volume to cancel the request.

When specifying **-clean-up-failure** to cancel a file restore request, the following steps are performed:

- Any files to which client I/O is not allowed are removed.
- Any Snapshot copy created for use during a file restore operation is deleted.
- The **RST** SnapMirror relationship is deleted.

LUNs to which client I/O is not allowed remain. For LUNs to which client I/O is not allowed, do one of the following:

- Use the **snapmirror restore** command to restore data to the LUN. Once the command completes successfully, client I/O to the LUN is allowed.
- Delete the LUN using the [lun delete](#) command with the **-force-fenced** parameter.

Similarly, NVMe namespaces to which client I/O is not allowed remain. For NVMe namespaces to which client I/O is not allowed, do one of the following:

- Use the **snapmirror restore** command to restore data to the NVMe namespace. Once the command completes successfully, client I/O to the NVMe namespace is allowed.
- Delete the NVMe namespace using the [vserver nvme namespace delete](#) command with the **-skip-mapped-check** parameter.

The **snapmirror restore** command must be used from the destination Vserver or cluster.

## Parameters

{ [-S, -source-path

{<[vserver:][volume]>|<[[cluster:]]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path

Specifies the source endpoint in one of three formats. The basic format includes the names of the Vserver (vserver) and volume (volume). A format which also includes the name of the cluster (cluster) is supported for consistency with other **snapmirror** commands. The form of the pathname which includes the cluster name is not valid when operating in a Vserver context. A non-Data ONTAP source endpoint (for example, AltaVault) can be specified in the form **hostip:/share/share-name**.

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the cluster in which the source volume resides. This parameter is not needed; it is provided for consistency with other **snapmirror** commands. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is not valid when operating in a Vserver context. This parameter is not supported if the source is a non-Data ONTAP endpoint.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. If this parameter is specified, the **-source-volume** parameter must also be specified. This parameter is not supported if the source is a non-Data ONTAP endpoint.

[-source-volume <volume name>] - Source Volume }

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** parameter must also be specified. This parameter is not supported if the source is a non-Data ONTAP endpoint.

{ -destination-path

{<[vserver:][volume]>|<[[cluster:]]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path

Specifies the destination endpoint in one of two formats. The basic format includes the names of the Vserver (vserver) and volume (volume). A format that also includes the name of the cluster (cluster) is supported for consistency with other **snapmirror** commands. The form of the pathname which includes the cluster name is not valid when operating in a Vserver context.

| [-destination-cluster <Cluster name>] - Destination Cluster

Specifies the cluster in which the destination volume resides. This parameter is not needed; it is provided for consistency with other **snapmirror** commands. If this parameter is specified, the **-destination-vserver** and **-destination-volume** parameters must also be specified. This parameter is not valid when operating in a Vserver context. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**.

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver. If this parameter is specified, the **-destination-volume** parameter must also be specified.

**-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume. If this parameter is specified, the **-destination-vserver** parameter must also be specified.

**[-s, -source-snapshot <text>] - Source Snapshot**

When restoring the entire contents of a Snapshot copy, this optional parameter identifies the Snapshot copy to be restored from the source volume to the destination volume. The default value is the latest snapshot on the source volume. When restoring one or more files, LUNs or NVMe namespaces from a Snapshot copy, this parameter is required.

**[-k, -throttle <throttleType>] - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for the restore transfer when the source and destination volumes belong to different clusters. It sets the maximum rate (in Kbytes/sec) at which data can be transferred between the clusters during the operation. To fully use the network bandwidth available between the clusters, set the throttle value to **unlimited** or **0**. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between **1** and **4**, it will be treated as if you specified **4**.

**[-transfer-priority {low|normal}] - Transfer Priority**

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is **normal**.

**[-disable-storage-efficiency <true>] - Disable Storage Efficient Transfer**

The default behavior of restore is to preserve storage efficiency when possible. Use this optional parameter to turn off storage efficiency for data transferred over the wire and written to the destination volume.

**[-clean-up-failure <true>] - Clean up after Failure**

Use this optional parameter to recover from an aborted or failed restore operation. Any temporary **RST** relationship is removed from the destination Vserver. An attempt is made to remove any temporary **RST** relationship from the source Vserver. If cleaning up an incomplete restore of the entire contents of a Snapshot copy and the destination volume was read-write prior to the failed or aborted restore operation, it is converted back to read-write if necessary, while removing all data transferred or copied during the restore operation. If cleaning up an incomplete restore of one or more files, LUNs or NVMe namespaces of a Snapshot copy, any file to which client I/O is not allowed is deleted.

**[-tries <unsigned32\_or\_unlimited>] - Tries Limit**

Specifies the total number of attempts to transfer data in cases where a transfer is interrupted by an error that SnapMirror can recover from. The value of this parameter must be a positive integer or **unlimited**.

**[-f, -force <true>] - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

**[-file-list <<source path>[,@<destination path>]>,<...>] - File List**

Specifies the files, LUNs or NVMe namespaces to be restored. The list can contain specifications

for up to 8 files, LUNs or NVMe namespaces. Specification for each file, LUN or NVMe namespace consists of a **source\_path** and an optional **destination\_path**, and is of the form '**source\_path**[@**destination\_path** ]'. **source\_path** is required and is the path of the file from the source Snapshot copy, e.g. /dira/file1 or /lun1. The source path does not include the Snapshot name nor the source volume name. The path to each file to be restored in the active file system of the destination volume is the same as the path specified by **source\_path**, unless an optional **destination\_path** is specified. **destination\_path** begins with the @ symbol followed by the path of the file from the root of the active file system of the destination volume, e.g. @/file1 or @/dira/lun1. File restore is not supported if the **source\_path** or **destination\_path** contains commas in its directory or file name. Each **source\_path** and **destination\_path** is a separate entity in the list of paths. A **destination\_path** is associated with the **source\_path** that immediately precedes it. If this parameter is specified, **-source-snapshot** must also be specified. Examples:

```
/dira/file1
```

```
/dira/file1,@/dirb/file2
```

```
/dira/file1,@/dirb/file2,/dirc/file3
```

#### **[-use-network-compression <true>] - Use Network Compression**

Use this optional parameter to use network compression for data transfer over the wire. This parameter is not supported for relationships with non-Data ONTAP endpoints.

## Examples

The following example does an incremental restore between the restore source volume **vs2.example.com:dept\_eng\_dp\_mirror2** and the restore destination volume **vs1.example.com:dept\_eng**:

```
vs1.example.com::> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
Warning: All data newer than Snapshot copy snap6 on volume
        vs1.example.com:dept_eng will be deleted.
Do you want to continue? {y|n}: y
[Job 34] Job is queued: snapmirror restore from source
vs2.example.com:dept_eng_dp_mirror2 for the snapshot snap3.
vs1.example.com::>
```

The following example restores /file3 from the source Snapshot copy **snap3** on the source volume **vs2.example.com:dept\_eng\_dp\_mirror2** to the active file system of the restore destination volume **vs1.example.com:dept\_eng**:

```
vs1.example.com::> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
  -file-list /file3
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 35] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com::>
```

The following example restores /file3 from the source Snapshot copy **snap3** on the source volume **vs2.example.com:dept\_eng\_dp\_mirror2** to /file3.new in the active file system of the restore destination volume **vs1.example.com:dept\_eng** :

```
vs1.example.com::> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
  -file-list /file3,@/file3.new
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 36] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com::>
```

The following example restores /file1, /file2, and /file3 from the source Snapshot copy **snap3** on the source volume **vs2.example.com:dept\_eng\_dp\_mirror2** respectively to /file1.new, /file2, and /file3.new in the active file system of the restore destination volume **vs1.example.com:dept\_eng** :

```
vs1.example.com::> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
  -file-list /file1,@/file1.new,/file2,/file3,@/file3.new
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 36] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com::>
```

# snapmirror resume

Enable future transfers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror resume** command enables future transfers for a SnapMirror relationship that has been quiesced.

If there is a scheduled transfer for the relationship, it will be triggered on the next schedule. If there is a restart checkpoint, it will be re-used if possible.

If applied on a load-sharing (LS) SnapMirror relationship, it enables future transfers for all the relationships in the load-sharing set.

If applied on a relationship with a policy of type **strict-sync-mirror** or **sync-mirror**, it enables future resync operations and initiates an Auto Resync.

When a quiesced SnapMirror relationship is resumed, future transfers remain enabled across reboots and fail-overs.

This command is supported for SnapMirror relationships with the field **"Relationship Capability"** showing as either **"8.2 and above"** or **"Pre 8.2"** in the output of the [snapmirror show](#) command.

The **snapmirror resume** command must be used from the destination Vserver or cluster.

The relationship must exist on the destination Vserver or cluster. When issuing **snapmirror resume**, you must specify the destination endpoint. The specification of the source endpoint of the relationship is optional.

## Parameters

**{ [-S, -source-path**

**{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form **hostip:/share/share-name**. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form **hostip:/lun/name**.

**[ [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**. This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**.

**[ -source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

**[ -source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

**{ -destination-path**

**{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path**

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form **hostip:/share/share-name**. For relationships with SolidFire destinations, the destination endpoint is specified in the form **hostip:/lun/name**.

**[ [-destination-cluster <Cluster name>] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**. This parameter

cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability" of "8.2 and above"**.

#### **-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with **"Relationship Capability" of "Pre 8.2"**, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with **"Relationship Capability" of "Pre 8.2"**, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

## Examples

To re-enable future transfers for the SnapMirror relationship with the destination endpoint **vs2.example.com:dept\_eng\_dp\_mirror2** that has been previously quiesced, type the following command:

```
vs2.example.com::> snapmirror resume -destination-path  
vs2.example.com:dept_eng_dp_mirror2
```

To re-enable future transfers for the SnapMirror relationship with the destination endpoint **cluster2://vs2.example.com/dept\_eng\_dp\_mirror2** that has been previously quiesced, type the following command:

```
cluster2::> snapmirror resume -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror2
```

To re-enable future transfers for the Vserver SnapMirror relationship with the destination endpoint **dvs1.example.com:** that has been previously quiesced, type the following command:

```
cluster2::> snapmirror resume -destination-path  
dvs1.example.com:
```

# snapmirror resync

## Start a resynchronize operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror resync** command establishes or reestablishes a mirroring relationship between a source and a destination endpoint. The endpoints can be Vservers, volumes or non-Data ONTAP endpoints that support SnapMirror. **snapmirror resync** for a SnapMirror relationship with volumes as endpoints is typically executed in the following cases:

- The destination mirror is broken (that is, the destination volume is a read-write volume and no longer a data protection mirror). After the **snapmirror resync** command completes, the destination volume is made a data protection mirror and the mirror can be manually updated or scheduled for updates.
- **snapmirror update** command failed because the required common Snapshot copy was deleted on the source volume.
- The volumes are the first and third endpoints in a cascade chain of relationships and they have a common Snapshot copy. In this case, **snapmirror resync** might implicitly create the SnapMirror relationship between them.

The **snapmirror resync** command can cause data loss on the destination volume because the command can remove the exported Snapshot copy on the destination volume.

The default behavior of the **snapmirror resync** command for volume relationships is defined as follows:

- Finds the most recent common Snapshot copy between the source and destination volumes, removes Snapshot copies on the destination volume that are newer than the common Snapshot copy and mounts the destination volume as a DP volume with the common Snapshot copy as the exported Snapshot copy.
- For data protection (DP) relationships, takes a Snapshot copy of the source volume to capture the current image and transfers Snapshot copies that are newer than the common Snapshot copy from the source volume to the destination volume. For extended data protection (XDP) relationships, transfers Snapshot copies newer than the common Snapshot copy according to the relationship policy, i.e., Snapshot copies will match rules associated with the policy as defined by the **snapmirror policy** commands. For relationships associated with **snapmirror policy** of type **async-mirror** and **mirror-vault** the **snapmirror resync** first takes a Snapshot copy of the source volume and includes it in the Snapshot copies selected for transfer.
- For a SnapLock Compliance volume in an XDP relationship with SnapMirror policy of type **async-mirror**, if SnapMirror resync operation detects data divergence between the common Snapshot copy and the AFS on the destination volume, the resync operation preserves the data changes in

a locked Snapshot copy for the duration of the current volume expiry time. If the volume expiry time is in the past or has not been set, then the Snapshot copy is locked for a duration of 30 days. The common Snapshot copy is also locked for the same duration.

For Vserver SnapMirror relationships, a resync operation is typically executed when the relationship is broken-off, the **subtype** of the destination Vserver is **default** and the destination volumes are of type read-write. Once the command is queued, the subtype of the destination Vserver changes from **default** to **dp-destination** . A successful resync operation also makes the destination Vserver's volumes data protection volumes.

If the resync command is executed on a Vserver SnapMirror relationship, and the corresponding source and destination Vservers have volumes with volume level SnapMirror relationships, then the volume level SnapMirror relationships will be converted to volumes under the Vserver SnapMirror relationship. This conversion is supported only for source and destination Vservers which have been transitioned from a 7-Mode vFiler into a C-Mode Vserver. Some basic pre-requisites for the conversion are that the destination Vserver should be in a **stopped** state and all the destination Vserver volumes except the root volume should be in a volume level SnapMirror relationship with volumes of the source Vserver. The state of these volume level SnapMirror relationships should be **Snapmirrored** and status should be **Idle** .

**snapmirror resync** for a relationship with a policy of type **strict-sync-mirror** or **sync-mirror** is typically executed in the following case:

- The destination mirror is broken (that is, the destination volume is read-write and no longer read-only). After the **snapmirror resync** command completes, the destination volume changes to read-only and the relationship to InSync.

The **snapmirror resync** command is typically not required to return a relationship that has fallen out of sync due to an error condition to InSync because SnapMirror has Auto Resync for synchronous relationships. When SnapMirror detects that the relationship has fallen out of sync for any reason other than a [snapmirror quiesce](#) , [snapmirror break](#) or [snapmirror delete](#) command was executed on the relationship, it will automatically initiate a resync operation.

The default behavior of the **snapmirror resync** command for relationships with a policy of type **strict-sync-mirror** or **sync-mirror** is defined as follows:

- Creates a Snapshot copy on the destination of the current image of the destination file system. This Snapshot copy becomes the exported Snapshot copy for the volume during the resync operation.
- Finds the most recent common Snapshot copy between the source and destination volumes. Performs a local rollback transfer to give the active file system the same data as the common Snapshot copy. It then loops through a sequence, creating a Snapshot copy on the source volume, transferring the data captured in that Snapshot copy, creating a Snapshot copy of the data on the destination, and repeating until the relationship is close to InSync. After the last transfer, it enters cutover to bring the relationship to InSync.
- User-created Snapshot copies are not replicated by a resync operation.
- At the conclusion of the resync operation, the exported Snapshot copy on the destination is

removed and the client will then see the active file system on the destination volume. The relationship will be InSync and periodic creation of common Snapshot copies will resume.

The `snapmirror resync` command supports an optional parameter **"preserve"**. The parameter **"preserve"** is only supported for extended data protection (XDP) relationships. It is not supported for relationships with a non-Data ONTAP endpoint. It is not supported for relationships with a policy of type **strict-sync-mirror** and **sync-mirror**. When used, the parameter **"preserve"** changes the behavior of the `snapmirror resync` command. The changed behavior of the command can be described as follows:

- Finds the most recent common Snapshot copy between the source and destination volumes, preserves all Snapshot copies on the destination volume that are newer than the common Snapshot copy, and mounts the destination volume as a DP volume with the common Snapshot copy as the exported Snapshot copy.
- Performs a local rollback transfer to make a copy of the common Snapshot copy on the destination volume and establish it as the latest Snapshot copy on the destination volume. The command then transfers all Snapshot copies that are newer than the common Snapshot copy, from the source volume to the destination volume. The command only transfers Snapshot copies that match the relationship's policy, i.e., Snapshot copies will match rules associated with the policy as defined by the `snapmirror policy` commands.

If a SnapMirror relationship does not already exist, that is, the relationship was not created using the `snapmirror create` command, the `snapmirror resync` command will implicitly create the SnapMirror relationship, with the same behaviors as described for the `snapmirror create` command before resyncing it.

For Vservers, you must create SnapMirror relationships between Vservers by using the `snapmirror create` command before you run the `snapmirror resync` command. The `snapmirror resync` command does not implicitly create the relationship.

This command is supported for SnapMirror relationships with the field **"Relationship Capability"** showing as either **"8.2 and above"** or **"Pre 8.2"** in the output of the `snapmirror show` command.

For relationships with **"Relationship Capability"** of **"8.2 and above"**, you can track the progress of the operation using the `snapmirror show` command.

For relationships with **"Relationship Capability"** of **"Pre 8.2"**, a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

The `snapmirror resync` command fails if the destination volume does not have a Snapshot copy in common with the source volume.

The `snapmirror resync` command does not work on load-sharing mirrors.

The `snapmirror resync` command must be used from the destination Vserver or cluster.

## Parameters

### { [-S, -source-path

{<[vserver:][volume]>|<[[cluster:]]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form **hostip:/share/share-name**. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form **hostip:/lun/name**.

### | [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**. This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**.

### [-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

### [-source-volume <volume name>] - Source Volume }

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

### { -destination-path

{<[vserver:][volume]>|<[[cluster:]]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form **hostip:/share/share-name**. For relationships with SolidFire destinations, the destination endpoint is specified in the form **hostip:/lun/name**.

### | [-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified,

parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**. This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**.

#### **-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **[-s, -source-snapshot <text>] - Source Snapshot**

This optional parameter specifies a Snapshot copy to transfer. The default behavior for a data protection relationship with a read-write source is that Data ONTAP creates a new Snapshot copy and uses it as the basis for determining what data are replicated; with this option, the specified Snapshot copy will be used instead. The default behavior for an extended data protection relationship depends on the relationship's policy type. For a data protection relationship, the specified Snapshot copy must be newer than the latest common Snapshot copy. For an extended data protection relationship, the specified Snapshot copy can be newer or older than the common Snapshot copy. This parameter is not supported for relationships with **"Relationship Capability"** of **"Pre 8.2"**.

#### **[-type <snapmirrorType>] - Snapmirror Relationship Type**

Specifies the type of SnapMirror relationship if a relationship is implicitly created. This parameter is the same as the one used in the [snapmirror create](#) command.

#### **[-policy <sm\_policy>] - SnapMirror Policy**

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. This parameter is not applicable to relationships with **"Relationship Capability"** of **"Pre 8.2"**.

You define and name a policy using the [snapmirror policy create](#) command.

#### **[-f, -force <>true>] - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

#### **[-k, -throttle <throttleType>] - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for the resync transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the [snapmirror create](#) or [snapmirror modify](#) command will be used. To fully use the network bandwidth available, set the throttle value to **unlimited** or **0**. The minimum throttle value is four Kbytes/sec, so if you

specify a throttle value between **1** and **4** , it will be treated as if you specified **4** . For FlexGroup relationships, the throttle value is applied individually to each constituent relationship. For relationships with a policy of type **strict-sync-mirror** or **sync-mirror** , the throttle value is applicable only for the asynchronous transfers of the resync operation. The **-throttle** parameter does not affect load-sharing transfers and transfers for other relationships with **"Relationship Capability"** of **"Pre 8.2"** confined to a single cluster.

#### **[-transfer-priority {low|normal}] - Transfer Priority**

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a **"Relationship Capability"** of **"Pre 8.2"** .

#### **[-preserve <true>] - Preserve**

This parameter is only supported for extended data protection (XDP) relationships with policies of type **vault** , and **mirror-vault** . It is not supported for relationships with a policy of type **async-mirror** and data protection and load-sharing relationships. This parameter is not supported for relationships with non-Data ONTAP endpoints. It is not supported for relationships with a policy of type **strict-sync-mirror** and **sync-mirror** . When specified, it changes the behavior of the **snapmirror resync** command to preserve Snapshot copies on the destination volume that are newer than the latest common Snapshot copy. This parameter is not supported for relationships with **"Relationship Capability"** of **"Pre 8.2"** .

#### **[-quick-resync <true>] - Quick Resync**

This parameter is only supported for extended data protection (XDP) relationships. This parameter is not supported for relationships with non-Data ONTAP endpoints. It is not supported for relationships with a policy of type **strict-sync-mirror** and **sync-mirror** . Specifying this optional parameter reduces the resync time because the resync does not incur storage efficiency overhead before the transfer of new data. Specifying this parameter is recommended if the source of the resync does not have volume efficiency enabled or if reducing resync time is more important than preserving all possible storage efficiency. When this parameter is specified, resync does not preserve the storage efficiency of the new data with existing data over the wire and on the destination.

#### **[-cg-item-mappings {<source volume>:@<destination volume>|<source item path>:@<destination item path>}] - Consistency Group Item Mappings**

This optional parameter specifies a list of the consistency group (CG) item mappings. It is considered only if the supplied source and destination path values denote valid CG paths. For CG level relationships, this parameter must be specified. The value for this parameter must contain mappings of one or more pairs of constituent source and destination volumes of the form **srcvol1:dstvol1,...** .

#### **[-is-auto-expand-enabled {true|false}] - Is Auto Expand Enabled**

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If this resync is creating a new Snapmirror relationship, the default value is true. If it is not creating a new relationship, if a value is specified, it must match the current value for the existing relationship. If the parameter is

not specified, the existing value will be retained.

### **[-w, -foreground <true>] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is **true** (the operation runs in the foreground). When set to **true**, the command will not return until the process completes. This parameter is only applicable to relationships with **"Relationship Capability"** of **"Pre 8.2"**.

## Examples

To reestablish mirroring for the destination endpoint `vs2.example.com:dept_mkt_mirror` that has been previously broken off with the `snapmirror break` command, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path
vs2.example.com:dept_mkt_dp_mirror
```

For relationships with **"Relationship Capability"** of **"Pre 8.2"**, to reestablish mirroring for the destination endpoint `cluster2://vs2.example.com/dept_mkt_mirror` that has been previously broken off with the `snapmirror break` command, type the following command:

```
cluster2::> snapmirror resync -destination-path
cluster2//vs2.example.com/dept_mkt_dp_mirror
```

To create a SnapMirror relationship and reestablish mirroring between the destination endpoint named `vs2.example.com:dept_eng_dp_mirror2` and the source endpoint named `vs1.example.com:dept_eng`, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path
vs2.example.com:dept_eng_dp_mirror2
-source-path vs1.example.com:dept_eng
```

To create a SnapMirror relationship and reestablish mirroring between the destination endpoint named `cluster2://vs2.example.com/dept_eng_dp_mirror2` and the source endpoint named `cluster1://vs1.example.com/dept_eng` when the source cluster is running Data ONTAP 8.1 software, type the following command:

```
cluster2::> snapmirror resync -destination-path
cluster2://vs2.example.com/dept_eng_dp_mirror2
-source-path cluster1://vs1.example.com/dept_eng
```

To create and reestablish an extended data protection (XDP) relationship between the Data ONTAP source endpoint `vs1.example.com:data_ontap_vol`, and the non-Data ONTAP (for example, AltaVault) destination endpoint `10.0.0.11:/share/share1`, and start the initial transfer, type the following command:

```
vs1.example.com::> snapmirror resync -destination-path  
10.0.0.11:/share/share1  
-source-path vs1.example.com:data_ontap_vol -type XDP
```

To reestablish mirroring for the destination endpoint **dvs1.example.com:** of a Vserver relationship that has been previously broken off with the [snapmirror break](#) command, type the following command:

```
cluster2::> snapmirror resync -destination-path  
dvs1.example.com:
```

To resynchronize the SnapMirror Business Continuity (SMBC) relationship with the source Consistency Group **cg\_src** in Vserver **vs1.example.com** and the destination Consistency Group **cg\_dst** in Vserver **vs2.example.com**, type the following command from the destination cluster:

```
destination::> snapmirror resync -destination-path  
vs2.example.com:/cg/cg_dst
```

To create and resynchronize an SMBC relationship with the following attributes:

- It is between the source Consistency Group **cg\_src** in Vserver **vs1.example.com**, and the destination Consistency Group **cg\_dst** in Vserver **vs2.example.com**.
- It has item mappings between volumes **srcvol1** and **srcvol2** and volumes **dstvol1** and **dstvol2**.
- It uses the default policy named **AutomatedFailOver** that has a policy type of **automated-failover**.

Type the following command from the destination cluster:

```
destination::> snapmirror resync -destination-path  
vs2.example.com:/cg/cg_dst -source-path  
vs1.example.com:/cg/cg_src  
-cg-item-mappings srcvol1:@dstvol1,srcvol2:@dstvol2
```

# snapmirror set-options

Display/Set SnapMirror options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror set-options` command can be used to display or set snapmirror options.

## Parameters

**`[-dp-source-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for DP Source Transfers**

Specifies the percentage of maximum allowed concurrent transfers reserved for source DP transfers

**`[-xdp-source-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for XDP Source Transfers**

Specifies the percentage of maximum allowed concurrent transfers reserved for source XDP transfers

**`[-dp-destination-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for DP Destination Transfers**

Specifies the percentage of maximum allowed concurrent transfers reserved for destination DP transfers

**`[-xdp-destination-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for XDP Destination Transfers**

Specifies the percentage of maximum allowed concurrent transfers reserved for destination XDP transfers

## Examples

The following example displays SnapMirror options:

```
cluster1::> snapmirror set-options
  Percentage Reserved for DP Source Transfers: 0
  Percentage Reserved for XDP Source Transfers: 0
  Percentage Reserved for DP Destination Transfers: 0
  Percentage Reserved for XDP Destination Transfers: 0
```

```
cluster1::> snapmirror set-options -dp-source-xfer-reserve-pct 25
-xdp-source-xfer-reserve-pct 50 -dp-destination-xfer
reserve-pct 0 -xdp-destination-xfer-reserve-pct 50

cluster1::> snapmirror set-options
Percentage Reserved for DP Source Transfers: 25
Percentage Reserved for XDP Source Transfers: 50
Percentage Reserved for DP Destination Transfers: 0
Percentage Reserved for XDP Destination Transfers: 50
```

## snapmirror show-history

Displays history of SnapMirror operations.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror show-history` command displays the history of the last 24 hours of SnapMirror operations. This command is not supported for relationships with non-Data ONTAP endpoints.

By default, the command displays the following information:

- Destination Path
- Source Path
- Operation
- Start Time
- End Time
- Result

The `snapmirror show-history` command displays - in reverse chronological order - the history of completed SnapMirror operations whose destination endpoints are in the current Vserver for Vserver administrators, or the current cluster for cluster administrators. This command does not return information on the following operations and relationships:

- Operations that happened prior to installing Data ONTAP 8.3.
- Relationships with the **"Relationship Capability"** field, as shown in the output of the SnapMirror show command, set to **"Pre 8.2"**.
- Operations on FlexGroup relationships that happened prior to installing Data ONTAP 9.5.
- Operations on FlexGroup constituent relationships.

The `-instance` parameter displays the following detailed information:

Destination Path: Path of the destination endpoint.  
Source Path: Path of the source endpoint.  
Relationship ID: The unique identifier of the relationship.  
This parameter is not supported for Vserver SnapMirror relationships.  
Relationship Group Type: For FlexVol relationships, specifies the type of the group relationship that includes this FlexVol. For group relationships, specifies the type of the group relationship. Can be one of the following:  
- none: No group relationship.  
- vserver: Vserver relationship.  
- flexgroup: FlexGroup relationship.  
Operation: Type of the operation.  
Can be one of the following:  
- create  
- modify  
- quiesce  
- resume  
- delete  
- initialize  
- manual update  
- scheduled update  
- break  
- resync  
- abort  
- restore  
Operation ID: The unique identifier of the operation.  
Start Time: Timestamp of the start of the operation.  
End Time: Timestamp of the end of the operation.  
Result: Result of the SnapMirror operation.  
Can be one of the following:  
- success  
- failure  
Transfer Size: Total amount of data transferred during the SnapMirror operation.  
Additional Information: A message describing the cause of the failure or additional information about a successful operation, such as if a checkpoint was cleared as part of an abort operation.

## Parameters

{[-fields <fieldname>,...]}

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**| [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**{ [-destination-path**

**{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>}} - Destination Path**

Select SnapMirror operations that have a matching destination path name.

**| [-destination-vserver <vserver name>] - Destination Vserver**

Select SnapMirror operations that have a matching destination Vserver name.

**[-destination-volume <volume name>] - Destination Volume }**

Select SnapMirror operations that have a matching destination volume name.

**[-operation-id <UUID>] - Operation ID**

Select SnapMirror operations that have a matching operation ID.

**[-source-path**

**{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>}} - Source Path**

Select SnapMirror operations that have a matching source path name.

**[-source-vserver <vserver name>] - Source Vserver**

Select SnapMirror operations that have a matching source Vserver name.

**[-source-volume <volume name>] - Source Volume**

Select SnapMirror operations that have a matching source volume name.

**[-operation-type {create|modify|quiesce|resume|delete|initialize|manual-update|scheduled-update|break|resync|abort|restore|failover}] - Operation Type**

Select SnapMirror operations that have a matching operation type. Possible values are:

- create
- modify
- quiesce
- resume
- delete
- initialize
- manual-update
- scheduled-update
- break
- resync
- abort

- restore

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

Select SnapMirror operations that have a matching start time.

**[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time**

Select SnapMirror operations that have a matching end time.

**[-relationship-id <UUID>] - Relationship ID**

Select SnapMirror operations that have a matching relationship ID.

**[-relationship-group-type {none|vserver|consistencygroup|flexgroup|vserverflexgroup}] - Relationship Group Type**

Select SnapMirror relationships that have a matching relationship group type. Possible values are:

- none
- vserver
- flexgroup

**[-result {success|failure}] - Result of the Operation**

Select SnapMirror operations that have a matching result. Possible values are:

- success
- failure

**[-transfer-size {<integer>[KB|MB|GB|TB|PB]}] - Transfer Size**

Select SnapMirror operations that have a matching transfer size.

**[-additional-info <text>] - Additional Information**

Select SnapMirror operations that have matching additional information.

**[-max-rows-per-relationship <integer>] - Maximum Number of Rows per Relationship**

Select a matching number of SnapMirror operations per relationship.

**[-expand <true>] - Show Constituents of the Group.**

Select SnapMirror operations on relationships that are constituents and non-constituents of a group.

## Examples

The example below displays summary information for all SnapMirror operations on relationships with destination endpoints in the current cluster:

```
cluster2::> snapmirror show-history
Destination Source          Start      End
Path         Path         Operation Time    Time      Result
-----
dvs2:        vs2:         create    8/15/2013 08:22:23
```

```

8/15/2013 08:22:25
success
vs1:vol1 vs1:aggr1 manual-update
8/15/2013 08:22:44
8/15/2013 08:22:44
failure
vs1:vol1 vs1:aggr1 initialize
8/15/2013 08:22:25
8/15/2013 08:22:26
success
vs1:vol1 vs1:aggr1 create 8/15/2013 08:22:15
8/15/2013 08:22:16
success
vs1:vol2 vs1:aggr1 initialize
8/15/2013 08:23:23
8/15/2013 08:23:23
failure
vs1:vol2 vs1:aggr1 create 8/15/2013 08:23:10
8/15/2013 08:23:10
success

```

6 entries were displayed.

The example below displays detailed information for the SnapMirror operation with operation ID **dc158715-0583-11e3-89bd-123478563412**

```

cluster2::> snapmirror show-history -operation-id dc158715-0583-11e3-89bd-123478563412
Destination Path: vs1:vol1
Source Path: vs1:aggr1
Relationship ID: cb3d30a0-0583-11e3-89bd-123478563412
Relationship Group Type: none
Operation: manual-update
Operation ID: dc158715-0583-11e3-89bd-123478563412
Start Time: 8/15/2013 08:22:44
End Time: 8/15/2013 08:22:44
Result: failure
Transfer Size: -
Additional Information: Volume vs1:vol1 is restricted. Use the command "volume
online" to bring the volume online.

```

The example below displays detailed information for all SnapMirror operations on relationships with the **Result** of "**success**" and whose destination endpoints are in the current cluster.

```

cluster2::> snapmirror show-history -result success -instance

# snapmirror show

Display a list of SnapMirror relationships

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror show** command displays information associated with SnapMirror relationships. By default, the command displays the following information:

- Source path
- Relationship Type
- Destination Path
- Mirror State
- Relationship Status
- Total Progress
- Healthy
- Progress Last Updated

For backward compatibility with clustered Data ONTAP 8.1, and to accommodate load-sharing relationships which are only supported in a Data ONTAP 8.1 compatible way, SnapMirror relationships, which match one of the following conditions are managed as on clustered Data ONTAP 8.1: (1) The relationship is of type load-sharing; (2) The source endpoint of the relationship is on a remote Data ONTAP 8.1 cluster; (3) The local cluster was upgraded from clustered Data ONTAP 8.1, the relationship was created before the upgrade, and the relationship has not yet been converted to one with Data ONTAP 8.2 capabilities. These relationships have the same limitations as on clustered Data ONTAP 8.1. Especially, they support the same set of information fields. The **"Relationship Capability"** field is set to **"Pre 8.2"** for these relationships.

The **snapmirror show** command displays information for SnapMirror relationships whose destination endpoints are in the current Vserver if you are in a Vserver context, or in the current cluster if you are in a cluster context, or on a non-Data ONTAP endpoint that supports SnapMirror (for example, AltaVault). For backward compatibility with clustered Data ONTAP 8.1, the command also displays information for SnapMirror relationships with the **"Relationship Capability"** of **"Pre 8.2"**, and whose source endpoints are in the current Vserver or cluster, and destination endpoints are in different Vservers or clusters. You must use the [snapmirror list-destinations](#) command to display information for SnapMirror relationships whose source endpoints are in the current Vserver or current cluster.

Some of the SnapMirror relationship information is cached. The **snapmirror show** command only returns the cached information, therefore there is a delay after the information is changed before it is reflected in the **snapmirror show** output. Other information, such as progress metrics during a transfer, is only updated periodically and can be very delayed in the **snapmirror show** output.

The **-instance** and **-fields** parameters are mutually exclusive and select the information fields that are displayed. The other parameters to the **snapmirror show** command select the SnapMirror relationships for which information is displayed. The **-instance** displays detailed information fields including:

Source Path: Path of the source endpoint.

Destination Path: Path of the destination endpoint.

Relationship Type: Type of the SnapMirror relationship. Can be one of the following:

- DP: Data protection relationship.
- LS: Load-sharing relationship.
- XDP: Extended data protection relationship.
- RST: Temporary relationship created during a restore operation, and deleted if the operation completes successfully.
- TDP: 7-mode to clustered Data ONTAP transition data protection relationship.

Relationship Group Type: For FlexVol relationships, specifies the type of the group relationship that includes this FlexVol. For group relationships, specifies the type of the group relationship. Can be one of the following:

- none: No group relationship.
- vserver: Vserver relationship.
- flexgroup: FlexGroup relationship.
- consistencygroup: Consistency Group relationship.

Only for relationships with

"Relationship Capability"  
of "8.2 and above" .

Relationship Status: Status of the SnapMirror relationship. Can be one of the following:

- Idle: No transfer operation is in progress and future transfers are not disabled.
- Queued: A transfer operation has been accepted and queued in the system, and future transfers are not disabled.
- Transferring: A transfer operation is in progress and future transfers are not disabled.
- Preparing: Pre-transfer phase for Vault incremental transfers. For Vault relationships only.
- Finalizing: Post-transfer phase for

- Vault incremental transfers.  
Network traffic will be low as processing is primarily on the destination volume.  
For Vault relationships only.
- Aborting: A transfer abort operation that might include the removal of the checkpoint is underway. Future transfers are not disabled. Only for relationships with "Relationship Capability" of "8.2 and above" .
  - Quiesced: No transfer operation is in progress and future transfers are disabled.
  - Quiescing: A transfer operation is in progress and future transfers are disabled.
  - Checking: Destination volume is undergoing a diagnostic check, no transfer is in progress, and future transfers are not disabled. Only for relationships with "Relationship Capability" of "Pre 8.2" .
  - Breaking: The SnapMirror relationship is being broken off and no transfer is in progress.

The following values are only applicable to relationships with a policy of type sync-mirror, strict-sync-mirror, or automated-failover:

- OutOfSync: The SnapMirror relationship is not InSync and no async transfer operation is in progress.
- Transitioning: The SnapMirror relationship is transitioning to InSync.
- InSync: The SnapMirror relationship is InSync.

**Mirror State:** State of the destination volume. Can be one of the following:

- Uninitialized: Destination volume has not been initialized.
- Snapmirrored: Destination volume has been initialized and is ready to receive SnapMirror updates.

```
- Broken-off: Destination volume is RW
                and snapshots are present.
Healthy: Condition of the relationship. Can be one of
the following:
- true: The SnapMirror relationship is
        healthy. It has not missed a
        scheduled transfer, or experienced
        a manual update failure.
- false: The SnapMirror relationship is not
         healthy. It has missed a scheduled
         transfer, or has experienced a manual
         update failure.
Unhealthy Reason: Reason the SnapMirror relationship is not
                  healthy. Only for relationships with
                  "Relationship Capability"
                  of "8.2 and above"
Newest Snapshot: Name of the newest Snapshot copy on the
                 destination volume.
Newest Snapshot Timestamp: Timestamp of the newest Snapshot copy.
Exported Snapshot: Name of the exported Snapshot copy on the
                 destination volume.
Exported Snapshot Timestamp: Timestamp of the exported Snapshot copy.
Lag Time: Time since the exported Snapshot copy
          was created. It is displayed in the
          format: hours:minutes:seconds.
          Only for relationships with
          "Relationship Capability"
          of "8.2 and above" .
Transfer Type: Type of the current transfer operation.
              Can be one of the following:
              - initialize
              - update
              - resync
              - restore
              Only for relationships with
              "Relationship Capability"
              of "8.2 and above" .
Transfer Snapshot: Name of the Snapshot copy being transferred.
Snapshot Progress: Amount of data transferred for the transfer
                  snapshot. This parameter is not supported
                  for SnapMirror FlexGroup relationships, but
                  it is supported for FlexGroup constituent
                  relationships.
Total Progress: Total amount of data transferred for the
                current transfer operation. This parameter
                is not supported for SnapMirror FlexGroup
                relationships, but it is supported for
                FlexGroup constituent relationships.
Percent Complete for Current Status: Percent complete for the current value
                                     of status. This field is only valid when the
                                     "Relationship Status" is
```

"Finalizing" .

**Network Compression Ratio:** The compression ratio achieved for the data sent over the wire as a part of the current transfer operation. The ratio is not maintained across checkpoint restarts. If network compression is disabled for the transfer, the ratio will be set to 1:1.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

**Snapshot Checkpoint:** The amount of data transferred as recorded in the restart checkpoint of the current or most recent transfer snapshot. If a restart checkpoint is present the next transfer will continue from the checkpoint. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

**Transfer Error:** Possible transient error condition if any, encountered by the current transfer operation.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above".

**Current Throttle:** The maximum transfer rate in Kilobytes per second, used for the current transfer between clusters.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

**Current Transfer Priority:** Priority assigned to the current transfer. Possible values are:

- low
- normal

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

**Last Transfer Type:** Type of the previous transfer operation:

- initialize
- update
- resync
- restore

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

**Last Transfer Size:** Total amount of data transferred during the previous transfer operation if it was

successful.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

This parameter is not supported for  
SnapMirror FlexGroup relationships, but it  
is supported for FlexGroup constituent  
relationships.

**Last Transfer Network Compression Ratio:** The compression ratio achieved  
for the data sent over the wire as a part of  
the previous transfer operation. If network  
compression was disabled for the transfer,  
the ratio will be set to 1:1.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

This parameter is not supported for Vserver  
or FlexGroup SnapMirror relationships, but it  
is supported for FlexGroup constituent  
relationships.

**Last Transfer Duration:** Duration of the previous transfer  
operation if it was successful.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

**Last Transfer From:** Source endpoint of the previous transfer  
operation.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

**Last Transfer End Timestamp:** Timestamp of the end of the previous  
transfer operation.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

**Last Transfer Error:** Cause of the failure of the previous  
transfer operation.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

**Relationship Capability:** Management and control compatibility:

- "Pre 8.2": Management and control of  
the relationship is compatible with  
clustered Data ONTAP 8.1.
- "8.2 and above": Full support of clustered  
Data ONTAP 8.2 or later SnapMirror  
relationship management and control.

This parameter is not supported for Vserver  
SnapMirror relationships.

**Relationship ID:** The unique identifier of the relationship.

Only for relationships with

"Relationship Capability" of "8.2 and above" .  
 This parameter is not supported for Vserver SnapMirror relationships.

Current Operation ID: Operation unique identifier of the currently executing SnapMirror operation.  
 Only for relationships with "Relationship Capability" of "8.2 and above" .

Throttle (KB/sec): Configured maximum transfer rate for cross-cluster transfers.

SnapMirror Policy Type: Type of the SnapMirror policy associated with the relationship. Can be one of the following:

- async-mirror
- vault
- mirror-vault

Refer to the man page for the

command

```
<<snapmirror-policy-create,snapmirror policy create>>
```

for a description of what these types mean.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

SnapMirror Policy: Name of the SnapMirror policy associated with the relationship.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

SnapMirror Schedule: Name of the schedule (empty if there is no schedule) associated with the relationship.

Tries Limit: Maximum number of times a transfer will be tried.

Only for relationships with

"Relationship Capability"

of "Pre 8.2" .

This parameter is not supported for Vserver SnapMirror relationships.

Destination Volume Node: Node which owns the destination volume of the relationship. For FlexGroup relationships it is the node which owns

the root constituent destination volume.

For object store relationships it is the

node which owns the source volume.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

This parameter is not supported for Vserver

SnapMirror relationships.

**Identity Preserve Vserver DR:** Whether or not the identity of the source Vserver is replicated to the destination Vserver. Can be:

- true: Source Vserver's configuration will additionally be replicated to the destination, along with the Vserver's volumes and RBAC configuration.
- false: Only volumes and RBAC configuration of the source Vserver is replicated to the destination.

This parameter is supported only for Vserver SnapMirror relationships.

**Volume MSIDs Preserved:** Whether or not the MSIDs of the source volumes are retained while creating destination volumes.

Can be:

- true: MSIDs of source Vserver volumes and destination Vserver volumes match.
- false: MSIDs of source Vserver volumes and destination Vserver volumes do not match.

This parameter is supported only for Vserver SnapMirror relationships.

**Is Auto Expand Enabled:** Whether or not the auto expand is enabled.

Can be:

- true: Auto Expand is enabled.
- false: Auto Expand is disabled.

This parameter is supported only for FlexGroup SnapMirror relationships.

**Is Adaptive Enabled:** Whether or not adaptive is enabled.

Can be:

- true: Adaptive is enabled.
- false: Adaptive is disabled.

This parameter is supported only for FlexVol SnapMirror relationships between Data ONTAP endpoints.

**Number of Successful Updates:** The number of successful SnapMirror update operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

**Number of Failed Updates:** The number of failed SnapMirror update operations for the relationship since the last reboot, aggregate relocation, takeover/

giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

**Number of Successful Resyncs:** The number of successful SnapMirror resync operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

**Number of Failed Resyncs:** The number of failed SnapMirror resync operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

**Number of Successful Breaks:** The number of successful SnapMirror break operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

**Number of Failed Breaks:** The number of failed SnapMirror break operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

**Total Transfer Bytes:** Cumulative bytes transferred for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback

involving the node that hosts the relationship.

Only for relationships with

"Relationship Capability"  
of "8.2 and above" .

This parameter is not supported for Vserver or FlexGroup volume SnapMirror relationships, but it is supported for FlexGroup volume constituent relationships.

**Total Transfer Time:** Cumulative total transfer time in seconds for the relationship since the last reboot, aggregate

relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that

hosts the relationship. Only for relationships with

"Relationship Capability"  
of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**{ [-S, -source-path**

**<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>}] - Source Path**

Select SnapMirror relationships that have a matching source path name.

**[ [-source-cluster <Cluster name>] - Source Cluster**

Select SnapMirror relationships that have a matching source cluster name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

**[-source-vserver <vserver name>] - Source Vserver**

Select SnapMirror relationships that have a matching source Vserver name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

**[-source-volume <volume name>] - Source Volume }**

Select SnapMirror relationships that have a matching source volume name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

**{ [-destination-path**

**<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>}] - Destination Path**

Select SnapMirror relationships that have a matching destination path name.

Using wildcards with this parameter:

- To match all Vserver Snapmirror relationships, use: ``-destination-path`*``:
- To match all the Snapmirror relationships except Vserver Snapmirror relationships in the cluster, use: ``-destination-path`*``

#### **[`-destination-cluster <cluster name>`] - Destination Cluster**

Select SnapMirror relationships that have a matching destination cluster name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **[`-destination-vserver <vserver name>`] - Destination Vserver**

Select SnapMirror relationships that have a matching destination Vserver name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **[`-destination-volume <volume name>`] - Destination Volume }**

Select SnapMirror relationships that have a matching destination volume name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **[`-type <snapmirrorType>`] - Relationship Type**

Select SnapMirror relationships that have a matching relationship type. Vservers support only DP SnapMirror relationships. Possible values are:

- DP
- LS
- XDP
- TDP
- RST

#### **[`-relationship-group-type {none|vserver|consistencygroup|flexgroup|vserverflexgroup}`] - Relationship Group Type**

Select SnapMirror relationships that have a matching relationship group type. Possible values are:

- none
- vserver
- flexgroup
- consistencygroup

#### **[`-vserver <vserver name>`] - Managing Vserver**

Select SnapMirror relationships that have a matching managing Vserver name. The `-vserver` option is currently a reserved option.

#### **[`-schedule <text>`] - SnapMirror Schedule**

Select SnapMirror relationships that have a matching schedule.

**[-policy-type {vault|async-mirror|mirror-vault|strict-sync-mirror|sync-mirror|automated-failover|continuous}] - SnapMirror Policy Type**

Selects SnapMirror relationships that have a matching SnapMirror policy type. Possible values are:

- async-mirror
- vault
- mirror-vault
- automated-failover
- sync-mirror
- strict-sync-mirror

**[-policy <sm\_policy>] - SnapMirror Policy**

Select SnapMirror relationships that have a matching SnapMirror policy.

**[-tries <unsigned32\_or\_unlimited>] - Tries Limit**

Select SnapMirror relationships that have a matching tries limit.

**[-k, -throttle <throttleType>] - Throttle (KB/sec)**

Select SnapMirror relationships that have a matching throttle.

**[-cg-item-mappings {<source volume>:@<destination volume>|<source item path>:@<destination item path>}] - Consistency Group Item Mappings**

Select SnapMirror relationships that have a matching cg-item-mappings.

**[-current-throttle <throttleType>] - Current Transfer Throttle (KB/sec)**

Select SnapMirror relationships that have a matching current throttle.

**[-state <mirror state>] - Mirror State**

Select SnapMirror relationships that have a matching mirror state. Possible values are:

- Uninitialized
- Snapmirrored
- Broken-off

**[-status <mirror status>] - Relationship Status**

Select SnapMirror relationships that have a matching relationship status. Possible values are:

- Idle
- Queued
- Transferring
- Preparing
- Finalizing
- Aborting
- Quiesced

- Quiescing
- Checking

Status values Finalizing, Checking, Waiting and Preparing are not supported for Vserver SnapMirror relationships.

**[-file-restore-file-count <integer>] - File Restore File Count**

The number of files being restored by file restore.

**[-file-restore-file-list <text>,...] - File Restore File List**

List of the destination file names of the files being restored by file restore.

**[-transfer-snapshot <text>] - Transfer Snapshot**

Select SnapMirror relationships that have a matching transfer Snapshot copy.

**[-snapshot-progress {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Progress**

Select SnapMirror relationships that have a matching Snapshot progress.

**[-total-progress {<integer>[KB|MB|GB|TB|PB]}] - Total Progress**

Select SnapMirror relationships that have a matching total progress.

**[-network-compression-ratio <text>] - Network Compression Ratio**

Select SnapMirror relationships that have a matching network compression ratio. This parameter is not supported for Vserver SnapMirror relationships.

**[-snapshot-checkpoint {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Checkpoint**

Select SnapMirror relationships that have a matching Snapshot copy checkpoint. This parameter is not supported for Vserver SnapMirror relationships.

**[-newest-snapshot <text>] - Newest Snapshot**

Select SnapMirror relationships that have a matching newest Snapshot copy.

**[-newest-snapshot-timestamp <MM/DD HH:MM:SS>] - Newest Snapshot Timestamp**

Select SnapMirror relationships that have a matching newest Snapshot copy timestamp.

**[-exported-snapshot <text>] - Exported Snapshot**

Select SnapMirror relationships that have a matching exported Snapshot copy name. For load-sharing mirror relationships, if the exported-snapshot field for a relationship has a dash (-), the load-sharing mirror is lagging behind the up-to-date mirrors in the set.

**[-exported-snapshot-timestamp <MM/DD HH:MM:SS>] - Exported Snapshot Timestamp**

Select SnapMirror relationships that have a matching exported Snapshot copy timestamp.

**[-healthy {true|false}] - Healthy**

Select SnapMirror relationships that have a matching healthy condition.

**[-relationship-id <UUID>] - Relationship ID**

Select SnapMirror relationships that have a matching relationship ID. This parameter is not

supported for Vserver SnapMirror relationships.

**[-current-operation-id <UUID>] - Current Operation ID**

Select SnapMirror relationships that have a matching operation unique identifier of the currently executing SnapMirror operation.

**[-current-transfer-type**

**{initialize|update|resync|restore|check|file\_restore|cggrs\_initialize|cggrs\_resync|cg\_update|cg\_initialize|cg\_resync|cg\_restore|catalog\_metadata|cg\_file\_restore|failover|aufo|failover\_incapable|cg\_migrate}] - Transfer Type**

Select SnapMirror relationships that have a matching current transfer type.

**[-current-transfer-error <text>] - Transfer Error**

Select SnapMirror relationships that have a matching current transfer error.

**[-last-transfer-type**

**{initialize|update|resync|restore|check|file\_restore|cggrs\_initialize|cggrs\_resync|cg\_update|cg\_initialize|cg\_resync|cg\_restore|catalog\_metadata|cg\_file\_restore|failover|aufo|failover\_incapable|cg\_migrate}] - Last Transfer Type**

Select SnapMirror relationships that have a matching last transfer type.

**[-last-transfer-error <text>] - Last Transfer Error**

Select SnapMirror relationships that have a matching last transfer error.

**[-last-transfer-size {<integer>[KB|MB|GB|TB|PB]}] - Last Transfer Size**

Select SnapMirror relationships that have a matching last transfer size.

**[-last-transfer-network-compression-ratio <text>] - Last Transfer Network Compression Ratio**

Select SnapMirror relationships that have a matching last transfer network compression ratio. This parameter is not supported for Vserver SnapMirror relationships.

**[-last-transfer-duration <[[<hours>]:<minutes>]:<seconds>>] - Last Transfer Duration**

Select SnapMirror relationships that have a matching last transfer duration.

**[-last-transfer-from <text>] - Last Transfer From**

Select SnapMirror relationships that have a matching last transfer source.

**[-last-transfer-end-timestamp <MM/DD HH:MM:SS>] - Last Transfer End Timestamp**

Select SnapMirror relationships that have a matching last transfer end timestamp.

**[-unhealthy-reason <text>] - Unhealthy Reason**

Select SnapMirror relationships that have a matching unhealthy reason.

**[-progress-last-updated <MM/DD HH:MM:SS>] - Progress Last Updated**

Select SnapMirror relationships that have a matching progress last updated.

**[-relationship-capability <text>] - Relationship Capability**

Select SnapMirror relationships that have a matching relationship capability. This parameter is not

---

supported for Vserver SnapMirror relationships.

**[-lag-time <[[<hours>:]<minutes>:]<seconds>>] - Lag Time**

Select SnapMirror relationships that have a matching lag time.

**[-current-transfer-priority {low|normal}] - Current Transfer Priority**

Select SnapMirror relationships that have a matching current transfer priority.

**[-is-smtape-op {true|false}] - SMTape Operation**

Select SnapMirror relationships that have a matching smtape operation.

**[-destination-volume-node <nodename>] - Destination Volume Node Name**

Select SnapMirror relationships that have a matching destination volume node name. This parameter is not supported for Vserver SnapMirror relationships.

**[-identity-preserve {true|false}] - Identity Preserve Vserver DR**

Select SnapMirror relationships that have a matching value for identity-preserve. This parameter is valid only for Vserver SnapMirror relationships.

**[-expand <true>] - Show Constituents of the Group**

Specifies whether to display constituent relationships of Vserver, FlexGroup and Consistency Group SnapMirror relationships. By default, the constituents are not displayed.

**[-update-successful-count <integer>] - Number of Successful Updates**

Select SnapMirror relationships that have a matching number of successful updates. This parameter is not supported for Vserver SnapMirror relationships.

**[-update-failed-count <integer>] - Number of Failed Updates**

Select SnapMirror relationships that have a matching number of failed updates. This parameter is not supported for Vserver SnapMirror relationships.

**[-resync-successful-count <integer>] - Number of Successful Resyncs**

Select SnapMirror relationships that have a matching number of successful resyncs. This parameter is not supported for Vserver SnapMirror relationships.

**[-resync-failed-count <integer>] - Number of Failed Resyncs**

Select SnapMirror relationships that have a matching number of failed resyncs. This parameter is not supported for Vserver SnapMirror relationships.

**[-break-successful-count <integer>] - Number of Successful Breaks**

Select SnapMirror relationships that have a matching number of successful breaks. This parameter is not supported for Vserver SnapMirror relationships.

**[-break-failed-count <integer>] - Number of Failed Breaks**

Select SnapMirror relationships that have a matching number of failed breaks. This parameter is not supported for Vserver SnapMirror relationships.

**[-total-transfer-bytes <integer>] - Total Transfer Bytes**

Select SnapMirror relationships that have a matching total transfer bytes. This parameter is not supported for Vserver SnapMirror relationships.

**[-total-transfer-time-secs <integer>] - Total Transfer Time in Seconds**

Select SnapMirror relationships that have a matching total transfer time in seconds. This parameter is not supported for Vserver SnapMirror relationships.

**[-msid-preserve {true|false}] - Source Volume MSIDs Preserved**

This parameter specifies whether the volume MSIDs are preserved at the destination. This parameter is applicable only for Vserver SnapMirror relationships.

**[-is-auto-expand-enabled {true|false}] - Is Auto Expand Enabled**

Select SnapMirror relationships that have a matching value for auto expand. This parameter is supported only for FlexGroup SnapMirror relationships. Possible values are:

- true
- false

**[-percent-complete-cur-status <integer>] - Percent Complete for Current Status**

Select SnapMirror relationships that have a matching percent complete for the current status.

## Examples

The example below displays summary information for all SnapMirror relationships with destination endpoints in the current cluster:

```
cluster2::> snapmirror show

# snapmirror update-ls-set

Start an incremental load-sharing set transfer

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror update-ls-set** command updates a set of load-sharing mirrors. The command makes destination volumes, in the group of load-sharing mirrors, up-to-date mirrors of the source volume.

The key parameter that identifies the set of load-sharing mirrors is the source volume. SnapMirror transfers are performed from the source volume to each of the up-to-date destination volumes in the set of load-sharing mirrors.

The **snapmirror update-ls-set** command performs an incremental transfer to each of the destination volumes. During an incremental transfer, Data ONTAP takes a Snapshot copy on the source volume

to capture the current image of the source volume, finds the most recent common Snapshot copy between the source and destination volumes, and incrementally transfers Snapshot copies that are newer than the common Snapshot copy to the destination volume.

You still need to use the `snapmirror update-ls-set` command to manually update the set of load-sharing mirrors even if the set only has one destination mirror. The `snapmirror update` command can only be used to bring up to date a specific destination mirror that is lagging to the set.

After an update using the `snapmirror update-ls-set` command successfully completes, the last Snapshot copy transferred is made the new exported Snapshot copy on the destination volumes.

This command is only supported for SnapMirror relationships with the field **"Relationship Capability"** showing as **"Pre 8.2"** in the output of the `snapmirror show` command.

## Parameters

`{ -S, -source-path`

`<[vserver:][volume]>|<[[cluster:]]//vserver/[volume]>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>}` - **Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with **"Relationship Capability"** of **"Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form **hostip:/share/share-name**. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form **hostip:/lun/name**.

`[-source-cluster <Cluster name>]` - **Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"**. This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"**.

`-source-vserver <vserver name>` - **Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

`-source-volume <volume name>` - **Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with **"Relationship Capability"** of **"Pre 8.2"**, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

### **[-w, -foreground <true>] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is **true** (the operation runs in the foreground). When set to **true**, the command will not return until the process completes. This parameter is only applicable to relationships with "**Relationship Capability**" of "**Pre 8.2**".

## Examples

To update the group of load-sharing mirrors for the source endpoint named `//vs1.example.com/vs1_root`, type the following command:

```
cluster1::> snapmirror update-ls-set -source-path //vs1.example.com/vs1_root
```

# snapmirror update

Start an incremental transfer

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror update** command updates the destination volume or non-Data ONTAP endpoint of a SnapMirror relationship. The **snapmirror update** command behaves differently for data protection (DP), extended data protection (XDP) and load-sharing (LS) relationships. Refer to the **-type** parameter of the [snapmirror create](#) command to understand different types of relationships supported by SnapMirror.

The **snapmirror update** command performs an incremental transfer.

Before using this command, the relationship must be initialized using the [snapmirror initialize](#) or [snapmirror initialize-ls-set](#) commands.

For data protection SnapMirror relationships with volumes as endpoints, the **snapmirror update** command makes the destination volume an up-to-date mirror of the source volume with the following steps:

- If the source volume is read-write, takes a Snapshot copy on the source volume to capture the current image of the source volume

- Finds the most recent Snapshot copy on the destination volume and validates that the corresponding Snapshot copy is still present on the source
- Incrementally transfers Snapshot copies that are newer than the corresponding Snapshot copy to the destination volume

You can use the **snapmirror update** command to update a specific load-sharing mirror that lags behind up-to-date destination volumes in the set of load-sharing mirrors. An update to the lagging load-sharing mirror should bring it up to date with the other up-to-date destination volumes in the set of load-sharing mirrors.

Using the **snapmirror update** command to update a set of load-sharing mirrors will not work. Use the **snapmirror update-ls-set** command to update a set of load-sharing mirrors.

For extended data protection (XDP) relationships with a **snapmirror policy** of type **async-mirror**, a **snapmirror update** always creates a new Snapshot copy on the source volume. Depending on the rules in the policy, the command might transfer just the newly created Snapshot copy or all Snapshot copies that are newer than the common Snapshot copy including the newly created Snapshot copy to the destination volume.

For extended data protection (XDP) relationships with a **snapmirror policy** of type **vault**, a **snapmirror update** does not create a new Snapshot copy on the source volume but transfers only selected Snapshot copies that are newer than the common Snapshot copy to the destination volume. (Those older than the common copy can be transferred by using the **-source-snapshot** parameter.) Snapshot copies are selected by matching the value of **-snapmirror-label** of a Snapshot copy with the value of **-snapmirror-label** of one of the rules from the corresponding SnapMirror policy associated with the SnapMirror relationship. All matching Snapshot copies are incrementally transferred to the destination volume.

For extended data protection (XDP) relationships with a **snapmirror policy** of type **mirror-vault**, a **snapmirror update** always creates a new Snapshot copy on the source volume and transfers only selected Snapshot copies that are newer than the common snapshot copy. The newly created Snapshot copy is always selected.

For extended data protection (XDP) relationships with a **snapmirror policy** of type **vault** or **mirror-vault**, the **snapmirror update** command also manages expiration of Snapshot copies on the destination volume. It does so by deleting Snapshot copies that have exceeded the value of **-keep** for the matching rule from the corresponding SnapMirror policy associated with the SnapMirror relationship. Snapshot copies that match the same **-snapmirror-label** will be deleted in oldest-first order.

For relationships with a policy of type **strict-sync-mirror** or **sync-mirror**, this command creates a new common Snapshot copy and designates it as the exported Snapshot copy on the destination volume. It updates the destination read-only view because IO is redirected to the new exported Snapshot copy. Clients could experience a brief latency spike during this process as the primary IO is temporarily fenced. This command is allowed only when the relationship-status is InSync. The command retains two pairs of common Snapshot copies and deletes the older ones.

For SnapMirror Business Continuity (SMBC) relationships with Consistency Groups of FlexVol

volumes as endpoints, the **snapmirror update** command creates a new coordinated common Snapshot copy. The command retains two coordinated common Snapshot copies and deletes the oldest one.

For data protection relationships, the parameter **-source-snapshot** is optional and only allows for the transfer of Snapshot copies newer than the common Snapshot copy up to the specified **-source-snapshot**.

For extended data protection (XDP) relationships the parameter **-source-snapshot** is optional.

For extended data protection (XDP) relationships with a **snapmirror policy** of type **vault** or **mirror-vault**, the parameter **-source-snapshot** allows transfer of a Snapshot copy that is older than the common Snapshot copy and/or might not be selected for transfer based on policy-based selection of a scheduled update transfer.

For extended data protection (XDP) relationships with a **snapmirror policy** of type **async-mirror**, the **snapmirror update** with parameter **-source-snapshot** does not create a new Snapshot copy on the source volume. Depending on the rules in the policy, the command might transfer just the specified Snapshot copy or Snapshot copies that are newer than the common Snapshot copy upto and including the specified Snapshot copy to the destination volume.

After the **snapmirror update** command successfully completes, the last Snapshot copy transferred is designated as the new exported Snapshot copy on the destination volume. If an update to an extended data protection (XDP) relationship specifies a Snapshot copy using the **-source-snapshot** parameter that is older than the common snapshot, after the **snapmirror update** successfully completes, the exported Snapshot copy on the destination volume will remain unchanged.

If the **snapmirror update** does not finish successfully—for example, due to a network failure or because a [snapmirror abort](#) command was issued—a restart checkpoint might be recorded on the destination volume. If a restart checkpoint is recorded, the next update restarts and continues the transfer from the restart checkpoint. For extended data protection (XDP) relationships, the next update will restart and continue the old transfer regardless of whether the Snapshot copy being transferred is a matching Snapshot copy or not.

This command is supported for SnapMirror relationships with the field **"Relationship Capability"** showing as either **"8.2 and above"** or **"Pre 8.2"** in the output of the [snapmirror show](#) command.

For relationships with **"Relationship Capability"** of **"8.2 and above"**, you can track the progress of the operation using the [snapmirror show](#) command.

For relationships with **"Relationship Capability"** of **"Pre 8.2"**, a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the [job show](#) and [job history show](#) commands.

For Vserver SnapMirror relationships, the **snapmirror update** command makes the destination Vserver an up-to-date mirror of the source Vserver.

The **snapmirror update** command must be used from the destination Vserver or cluster.

## Parameters

{ [-S, -source-path

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with **"Relationship Capability" of "Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability" of "8.2 and above"**. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form **hostip:/share/share-name**. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form **hostip:/lun/name**.

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with **"Relationship Capability" of "Pre 8.2"**. This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability" of "8.2 and above"**.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with **"Relationship Capability" of "Pre 8.2"**, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>] - Source Volume }

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with **"Relationship Capability" of "Pre 8.2"**, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ -destination-path

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with **"Relationship Capability" of "Pre 8.2"**, a format which also includes the name of the cluster (cluster) is provided. The **"Pre 8.2"** format cannot be used when operating in a Vserver context on relationships with **"Relationship Capability" of "8.2 and above"**. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form **hostip:/share/share-name**. For relationships with SolidFire destinations, the destination endpoint is specified in the form **hostip:/lun/name**.

| [-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified,

parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with **"Relationship Capability"** of **"Pre 8.2"** . This parameter cannot be specified when operating in a Vserver context on relationships with **"Relationship Capability"** of **"8.2 and above"** .

#### **-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with **"Relationship Capability"** of **"Pre 8.2"** , **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with **"Relationship Capability"** of **"Pre 8.2"** , **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

#### **[-s, -source-snapshot <text>] - Source Snapshot**

This optional parameter specifies a Snapshot copy to transfer. The default behavior for a data protection relationship with a read-write source is that Data ONTAP creates a new Snapshot copy and uses it as the basis for determining what data are replicated; with this option, the specified Snapshot copy will be used instead. The default behavior for an extended data protection relationship depends on the relationship's policy type. For a data protection relationship, the specified Snapshot copy must be newer than the latest common Snapshot copy. For an extended data protection relationship, the specified Snapshot copy can be newer or older than the common Snapshot copy. This parameter is not supported for relationships with **"Relationship Capability"** of **"Pre 8.2"** .

#### **[-k, -throttle <throttleType>] - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for the update transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the [snapmirror create](#) or [snapmirror modify](#) command will be used. To fully use the network bandwidth available, set the throttle value to **unlimited** or **0** . The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between **1** and **4** , it will be treated as if you specified **4** . For FlexGroup relationships, the throttle value is applied individually to each constituent relationship. The **-throttle** parameter does not affect load-sharing transfers and transfers for other relationships with **"Relationship Capability"** of **"Pre 8.2"** confined to a single cluster.

#### **[-transfer-priority {low|normal}] - Transfer Priority**

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a **"Relationship Capability"** of **"Pre 8.2"** .

#### **[-enable-storage-efficiency <true>] - Enable Storage Efficient Transfers**

This is an optional parameter. For an extended data protection (XDP) relationship that is currently not storage efficient, set this parameter to true to enable storage efficient transfers. Storage

efficient in this context refers to both over the wire efficiency and how the data is written to the destination volume. The transfer fails if storage efficiency cannot be achieved. If the transfer succeeds, future transfers will continue being storage efficient as long as it is still feasible, but will not fail if the transfer is not storage efficient. The default value is false. This parameter is not supported for relationships with non-Data ONTAP endpoints.

### **[-w, -foreground <true>] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is **true** (the operation runs in the foreground). When set to **true**, the command will not return until the process completes. This parameter is only applicable to relationships with **"Relationship Capability"** of **"Pre 8.2"**.

## Examples

To update the mirror relationship between the destination endpoint **vs2.example.com:dept\_eng\_dp\_mirror3** and its source endpoint, type the following command:

```
vs2.example.com::> snapmirror update -destination-path  
vs2.example.com:dept_eng_dp_mirror3
```

For relationships with **"Relationship Capability"** of **"Pre 8.2"**, to update the mirror relationship between the destination endpoint **cluster2://vs2.example.com/dept\_eng\_dp\_mirror3** and its source endpoint, type the following command:

```
cluster2::> snapmirror update -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror3
```

To update the Vserver SnapMirror relationship between destination endpoint **dvs1.example.com:** and its source endpoint, type the following command:

```
cluster2::> snapmirror update -destination-path  
dvs1.example.com:
```

To update the SMBC relationship with the destination Consistency Group **cg\_dst** in Vserver **vs2.example.com**, type the following command on the destination cluster:

```
destination::> snapmirror update -destination-path  
vs2.example.com:/cg/cg_dst
```

## snapmirror config-replication cluster-storage-configuration modify

Modify SnapMirror storage configuration information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `snapmirror config-replication cluster-storage-configuration modify` command modifies the configuration of storage used for configuration replication.

### Parameters

`[-disallowed-aggregates <aggregate name>, ...]` - Disallowed Aggregates

Use this parameter to set the list of storage aggregates that are not available to host storage for configuration replication.

### Examples

The following example disallows two aggregates named **aggr1** and **aggr2** :

```
cluster1::*> snapmirror config-replication cluster-storage-configuration modify
-disallowed-aggregates aggr1,aggr2
```

## snapmirror config-replication cluster-storage-configuration show

Display SnapMirror storage configuration information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `snapmirror config-replication cluster-storage-configuration show` command shows details of the configuration of the storage used for configuration replication.

The information displayed is the following:

- Disallowed Aggregates - The list of storage aggregates that are configured as not allowed to host storage areas.
- Auto-Repair - Displays **true** if the automatic repair of storage areas used by configuration replication is enabled.
- Auto-Recreate - Displays **true** if the automatic recreation of storage volumes used by configuration replication is enabled.
- Use Mirrored Aggregate - Displays **true** if storage areas for configuration replication are to be hosted on a mirrored aggregate.

## Examples

The following is an example of the `snapmirror config-replication cluster-storage-configuration show` command:

```
cluster1::*> snapmirror config-replication cluster-storage-configuration show
Disallowed Aggregates: -
    Auto-Repair: true
    Auto-Recreate: true
Use Mirrored Aggregate: true
```

# snapmirror config-replication status show-aggregate-eligibility

Display the SnapMirror configuration replication aggregate eligibility

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror config-replication status show-aggregate-eligibility` command displays the SnapMirror configuration replication aggregate eligibility.

## Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the

specified field or fields. You can use '-fields ?' to display the fields to specify.

### [**-instance** ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### [**-aggregate <aggregate name>**] - **Aggregate**

Display only rows that have a matching aggregate name.

### [**-hosted-configuration-replication-volumes <volume name>,...**] - **Currently Hosted Configuration Replication Volumes**

Display only rows that have matching configuration replication volumes hosted on this aggregate.

### [**-is-eligible-to-host-additional-volumes {true|false}**] - **Eligibility to Host Another Configuration Replication Volume**

Display only rows that have a matching eligibility of the aggregate to host additional configuration replication volumes.

### [**-comment <text>**] - **Comment for Eligibility Status**

Display only rows that have a matching comment regarding the eligibility of the aggregate to host configuration replication volumes.

## Examples

The following example shows the execution of the command in a SnapMirror configuration with thirteen aggregates in the cluster:

```
clusA::snapmirror config-replication status> show-aggregate-eligibility
Aggregate      Hosted Config Replication Vols      Eligible to
-----      -----      -----      -----
a0              -              false          Root Aggregate
a1      MDV_CRS_1bc7134a5ddf11e3b63f123478563412_A true          -
a2      MDV_CRS_1bc7134a5ddf11e3b63f123478563412_B true          -

a12      -                false      Aggregate Full
13 entries were displayed.

```

# snapmirror config-replication status show-communication

Display SnapMirror configuration replication communication status information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror config-replication status show-communication` command displays the current SnapMirror configuration replication communication status.

The command displays the following aspects of SnapMirror configuration replication for each peer cluster:

- Remote Heartbeat: Verifies that the SnapMirror configuration replication heartbeat with the remote cluster is healthy.
- Last Heartbeat Sent: Prints the timestamp of the last SnapMirror configuration replication heartbeat sent to the remote cluster.
- Last Heartbeat Received: Prints the timestamp of the last SnapMirror configuration replication heartbeat received from the remote cluster.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-cluster-uuid <UUID>] - Remote Cluster`

Display only rows that have a matching peer cluster UUID.

**[-cluster <text>] - Peer Cluster Name**

Display only rows that have matching peer cluster name.

**[-remote-heartbeat {ok|warning|not-run|not-applicable}] - Remote Heartbeat**

Display only rows that have a matching remote heartbeat status.

**[-last-heartbeat-sent <MM/DD/YYYY HH:MM:SS>] - Last Heartbeat Sent Time**

Display only rows that have a matching timestamp of the last heartbeat sent.

**[-last-heartbeat-received <MM/DD/YYYY HH:MM:SS>] - Last Heartbeat Received Time**

Display only rows that have a matching timestamp of the last heartbeat received.

**[-heartbeat-recovery-steps <text>] - Heartbeat Recovery Steps**

Display only rows that have matching heartbeat recovery steps.

## Examples

The following example shows the execution of the command in a SnapMirror configuration with two peer clusters:

```
clus1::*> snapmirror config-replication status show-communication
  Peer Cluster: clus2
  Remote Heartbeat: ok
  Last Heartbeat Sent: 11/11/2014 11:11:45
  Last Heartbeat Received: 11/11/2014 11:11:46
  Peer Cluster: clus3
  Remote Heartbeat: ok
  Last Heartbeat Sent: 11/11/2014 11:11:26
  Last Heartbeat Received: 11/11/2014 11:11:27

2 entries were displayed.
```

## snapmirror config-replication status show

Display SnapMirror configuration replication status information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **snapmirror config-replication status show** command displays the current SnapMirror configuration replication status.

The command displays the following aspects of SnapMirror configuration replication:

- Enabled: Verifies that SnapMirror configuration replication is enabled on the cluster.

- **Running:** Verifies that SnapMirror configuration replication is running on the cluster.
- **Storage Status:** Verifies that SnapMirror configuration replication storage is healthy.
- **Storage In Use:** Prints the location of SnapMirror configuration replication storage.
- **Storage Remarks:** Prints the underlying root cause for non-healthy SnapMirror configuration storage.
- **Vserver Streams:** Verifies that SnapMirror configuration replication Vserver streams are healthy.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

## Parameters

### `[-instance ]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

## Examples

The following example shows the execution of the command:

```
clus1::*> snapmirror config-replication status show
      Enabled: true
      Running: true
      Storage Status: ok
      Storage In Use: Cluster-wide Volume:
MDV_CRS_3d47e9106b7d11e4a77b000c29f810a2_A
      Storage Remarks: -
      Vserver Streams: ok
```

## snapmirror failover show

Display failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror failover show` command is used to monitor the progress of the failover operation on the SnapMirror Business Continuity (SMBC) relationship. You must execute this command from the destination cluster of the SMBC relationship.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

Start operation time of the failover.

**[-source-path**

**{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Source Path**

Specifies the source endpoint of the SnapMirror relationship.

**[-destination-path**

**{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>} - Destination Path**

Specifies the destination endpoint of the SnapMirror relationship.

**[-status {started|failed|completed|completed\_with\_warnings}] - Failover Status**

This status of snapmirror failover.

**[-error-reason <text>] - Error Reason**

The reason for failure occurred during snapmirror failover.

**[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time**

End operation time of the failover.

**[-primary-data-cluster <text>] - Primary Data Cluster**

Primary data cluster.

**[-last-progress-update <text>] - Last Progress Update**

Last progress update.

**[-type {planned|unplanned|incapable}] - Failover Type**

Whether the SnapMirror failover was planned or unplanned.

**[-error-reason-codes <integer>, ...] - Error Reason codes**

The reason codes for failure occurred during snapmirror failover.

## Examples

To see the progress of the failover operation performed on an SMBC relationship with destination

Consistency Group **cg\_dst** in Vserver **vs2.example.com** , type the following command from the destination cluster:

```
destination::> snapmirror failover show -destination-path  
vs2.example.com:/cg/cg_dst
```

## snapmirror failover start

Start planned failover for SnapMirror relationships with 'automated-failover' policy-type

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The **snapmirror failover start** command initiates a planned failover operation to change the roles of copies in a SnapMirror Business Continuity (SMBC) relationship without disrupting the client operations. The primary writable volumes become the secondary data protection volumes while the secondary data protection volumes become the primary writable volumes. The new primary volumes can begin processing I/O requests locally without disrupting the client operations. Asymmetric Logical Unit Access (ALUA) reporting will also change as a part of this role change.

You should execute the **snapmirror failover start** command from the destination cluster.

Make sure the relationship status is InSync and the ONTAP Mediator is configured, connected, and in quorum before using this command to switch the primary and secondary roles.

### Parameters

#### -destination-path

```
{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgroup]>} - Destination Path
```

Specifies the destination endpoint of the SnapMirror relationship.

### Examples

To perform a planned failover operation of an SMBC relationship with source Consistency Group **cg\_src** in Vserver **vs1.example.com** , and the destination Consistency Group **cg\_dst** in Vserver **vs2.example.com** , type the following command from the destination cluster:

```
destination::> snapmirror failover start -destination-path  
vs2.example.com:/cg/cg_dst
```

Note: The SMBC relationship information in the `snapmirror show` command will now be available on the new destination that is Vserver `vs2.example.com` with `cg_dst` as the new source and `cg_src` as the new destination Consistency Groups after the SnapMirror failover operation is completed.

## Related Links

- [snapmirror show](#)

# snapmirror mediator add

Create mediator config entry

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror mediator add` command configures the connection between a pair of clusters and an ONTAP Mediator. It is mandatory to initialize the ONTAP Mediator on one of the cluster peers before the SnapMirror Business Continuity (SMBC) relation with policy type **automated-failover** performs a planned or an unplanned failover. You can initialize the ONTAP Mediator from either cluster. When you issue the ONTAP Mediator add command on one cluster, the ONTAP Mediator is automatically added on the other cluster.

## Parameters

**-mediator-address <IP Address> - Mediator Ip Address**

Specifies the IP address of the mediator.

**-peer-cluster <text> - Peer cluster**

Peer cluster with AutomatedFailOver SnapMirror relationships.

**-username <text> - Username**

User account at the mediator.

**[-port-number <integer>] - Port Number**

This optional parameter specifies the mediator service port number to communicate with the mediator. The port number must be in the range 1025 to 65535 inclusive. The default port number is 31784.

## Examples

The following example configures the connection between a mediator and a pair of clusters.

```
clusA::> snapmirror mediator add -mediator-address 10.234.102.227 -peer-cluster clusB
-username admin
Notice: Enter the mediator password.
Enter the password:
      Enter the password again:
Info: [Job: 114] 'mediator add' job queued
```

## snapmirror mediator remove

Remove mediator config entry

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror mediator remove` command deletes a mediator configuration entry.

### Parameters

**-mediator-address <IP Address> - Mediator Ip Address**

Specifies the IP address of the mediator.

**-peer-cluster <text> - Peer cluster**

Peer cluster with AutomatedFailOver SnapMirror relationships.

### Examples

The following example removes a mediator configuration entry.

```
clusA::> snapmirror mediator remove -mediator-address 10.140.102.227 -peer-cluster
clusB
Info: [Job 36] 'mediator remove' job queued
```

## snapmirror mediator show

Show mediator information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror mediator show` command shows the status of the ONTAP Mediator configuration.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-mediator-address <IP Address>] - Mediator IP Address`

Ip address of the mediator.

`[-peer-cluster <text>] - Peer Cluster Name`

Peer cluster name.

`[-connection-status {connected|unreachable|suspended|unusable|misconfigured|removing|not-configured|unknown|adding}] - Connection Status`

Connection status of the cluster with the mediator.

`[-quorum-status {unknown|true|false}] - Mediator Quorum Status`

Shows whether the SnapMirror Consistency Group relationships are synchronized with mediator.

`[-health-fetch-timeout <integer>] - Peer Health Fetch Timeout`

Timeout value (in seconds) for peer-cluster health fetch via mediator.

`[-connection-timeout <integer>] - Connection Timeout`

Timeout value (in seconds) for mediator connection.

## Examples

The following example shows the list of mediator configurations.

```
clusA::*> snapmirror mediator show
  Mediator Address Peer Cluster      Connection Status Quorum Status
  -----
  10.140.102.227  clusB      unreachable      true
clusA::*> snapmirror mediator show -instance
Mediator Uuid: 416fbdee-c982-11e9-9034-005056a7124c
Mediator IP Address: 10.140.102.227
Peer Cluster: clusB
```

```
Peer Cluster Uuid: 771d9b13-c973-11e9-928e-005056a7a882
Connection Status: unreachable
Quorum Status: true
Health Fetch Timeout: 5
Connection Timeout: 5
```

## snapmirror mediator primary-bias show

### Show Primary Bias Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror mediator primary-bias show` command shows the status of primary-bias. This command is applicable when mediator status is shown as unreachable/misconfigured.

This will also show the state corresponding to each CG endpoint residing on the given cluster. Slave CG endpoints will show the state of "Failover disabled". Master CG endpoints will show the state of Primary-bias activation.

The status of primary-bias(md-state) can be one of the following. + primary-bias-activated - represent the state that allows master endpoints to assume the I/O serving authority + primary-bias-not-activated - represent the state that mediator is reachable from primary and secondary clusters and IO serving authority set to default + mediator-engaged-for-failover - represent the setting of the intermediate state preventing Failover on slave endpoints of a CG + mediator-disengaged-for-failover - represent the clearing of the intermediate state following which the Failover on slave endpoints of a CG is no more prevented +

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-cg-path`

`<[vserver:][volume]>|<[[cluster://vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>}] - Cg Path`

CG path.

`[-cg-role {destination|source}] - Role`

Indicates if CG is primary or secondary on local cluster.

`[-mb-state {Primary bias activated. Mediator Disengaged|Primary bias deactivated. Mediator engaged|Mediator disengaged for failover|Mediator engaged for failover}] - MB state`

Primary bias State.

## Examples

The following example shows the status of primary bias

```
C2_sti7-vsिम-ucs569o_cluster::~*> snapmirror mediator primary-bias show
CG Path      Role      status

# snapmirror mediator primary-bias history show

## Show Primary Bias History

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror mediator primary-bias history show` command shows the history of Primary bias events.

The setting/clearing of the Primary Bias states (including the intermediate state) will be logged as event history per CG endpoint in the "snapmirror mediator primary bias history" command. The "mediator-engaged/disengaged-for-failover" actions will represent the setting/clearing of the intermediate state preventing Failover on slave endpoints of a CG. The "primary-bias-activated/not-activated" will represent the state that allows master endpoints to assume the I/O serving authority.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-cg-path**

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>}] - Cg Path

CG path.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - TBA Task Start Time**

Time of event

[-action {Primary bias activated. Mediator Disengaged|Primary bias deactivated. Mediator engaged|Mediator disengaged for failover|Mediator engaged for failover}] - Event

Primary bias event.

## Examples

The following example shows the history output

```
C1_sti7-vsimg-ucs569m_cluster::*> snapmirror mediator primary-bias history show -cg
-path vs0:/cg/scg
  CG Path          Time                Action
  -----
  vs0:/cg/scg      7/25/2022 10:33:28
                    primary-bias-activated
  vs0:/cg/scg      7/25/2022 22:42:33
                    primary-bias-not-activated
  2 entries were displayed.

```

# snapmirror mediator tba-history show

Show Mediator Agent Event History

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror mediator tba-history show` command shows the history of the ONTAP Mediator Agent events..

## Parameters

{[-fields <fieldname>,...]}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -cg-rel-uuid <UUID> ] - Cg Relationship Uuid**

Cg Relationship Uuid.

**[ -start-time <MM/DD/YYYY HH:MM:SS> ] - TBA Task Start Time**

Mediator Agent Task Start Time.

**[ -token-num <integer> ] - Token Number**

Token Number.

**[ -cg-path**

{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[cgname]>}] - Cg Path

Cg Path.

**[ -aux-generation-num <integer> ] - Auxillary Generation Number**

Auxillary Generation Number.

**[ -cg-rel-task <text> ] - TBA Task Type**

Mediator Agent Task Type.

**[ -cg-rel-state {invalid-state|waiting|task-processing|task-complete} ] - Cg Management State**

Cg Management State.

**[ -end-time <MM/DD/YYYY HH:MM:SS> ] - TBA Task End Time**

Mediator Agent Task End Time.

**[ -cg-rel-action {invalid|none|continue|stop|failover-incapable|auto-failover|success|failed|mismatch|retry|success-pending|stop-pending|continue-pending|failover-incapable-pending|try-failover-incapable-ic|try-failover-incapable-med|try-auto-failover} ] - Cg Management Action**

Cg Management Action.

**[ -errCode <integer> ] - Error Code for Task Failure**

Error Code for Task Failure.

## snapmirror object-store config create

Define the configuration for a SnapMirror object store

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The **snapmirror object-store config create** command is used by a cluster administrator to tell Data ONTAP how to connect to an object store. Following pre-requisites must be met before creating an object store configuration in Data ONTAP.

- A valid data bucket or container must be created with the object store provider. This assumes that the user has valid account credentials with the object store provider to access the data bucket.
- The Data ONTAP node must be able to connect to the object store. This includes
- Fast, reliable connectivity to the object store.
- An inter-cluster LIF (Logical Interface) must be configured on the cluster.

- If SSL/TLS authentication is required, then valid certificates must be installed.

An object-store configuration once created must not be reassocated with a different object-store or container. See [snapmirror object-store config modify](#) command for more information.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the vservers on which the object store configuration needs to be created.

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the name that will be used to identify the object store configuration. The name can contain the following characters: "", "-", A-Z, a-z, and 0-9. The first character must be one of the following: "", A-Z, or a-z.

### **-usage {data|metadata} - Object Store Use**

This parameter specifies the usage for an object store configuration

### **-provider-type <providerType> - Type of the Object Store Provider**

This parameter specifies the type of object store provider that will be attached to the aggregate. Valid options are: AWS\_S3 (Amazon S3 storage), Azure\_Cloud (Microsoft Azure Cloud), SGWS (StorageGrid WebScale), IBM\_COS (IBM Cloud Object Storage), AliCloud (Alibaba Cloud Object Storage Service), GoogleCloud (Google Cloud Storage) and ONTAP\_S3.

### **-server <Remote InetAddress> - Fully Qualified Domain Name of the Object Store Server**

This parameter specifies the Fully Qualified Domain Name (FQDN) of the remote object store server. For Amazon S3, server name must be an AWS regional endpoint in the format s3.amazonaws.com or s3-<region>.amazonaws.com, for example, s3-us-west-2.amazonaws.com. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the **-server** is a "blob.core.windows.net" or a "blob.core.usgovcloudapi.net", then a value of **-azure-account** followed by a period will be added in front of the server.

### **[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

This parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store. The default value is **true**.

### **[-port <integer>] - Port Number of the Object Store**

This parameter specifies the port number on the remote server that Data ONTAP will use while establishing connection to the object store.

### **-container-name <text> - Data Bucket/Container Name**

This parameter specifies the data bucket or container that will be used for read and write operations.

This name cannot be modified once a configuration is created.

**[-access-key <text>] - Access Key ID for S3 Compatible Provider Types**

This parameter specifies the access key (access key ID) required to authorize requests to the AWS S3, SGWS, IBM COS object stores and ONTAP\_S3. For an Azure object store see **-azure-account** .

**[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

This optional parameter specifies the IPspace to use to connect to the object store. Default value: **Default** .

**[-use-iam-role {true|false}] - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP**

This optional parameter is deprecated. Please use **-auth-type** instead. Note, that **-auth-type EC2-IAM** is an equivalent of **-use-iam-role true** , and **-auth-type key** is an equivalent of **-use-iam-role false** .

**[-secret-password <text>] - Secret Access Key for S3 Compatible Provider Types**

This parameter specifies the password (secret access key) to authenticate requests to the AWS S3, SGWS, IBM COS object stores and ONTAP\_S3. If the **-access-key** is specified but the **-secret-password** is not, then one will be asked to enter the **-secret-password** without echoing the input.

**[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

This parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when **is-ssl-enabled** is **true** . The default value is **true** . It is recommended to use the default value to make sure that Data ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

**[-azure-account <text>] - Azure Account**

This parameter specifies the account required to authorize requests to the Azure object store. For other object store providers see **access-key**.

The value of this field cannot be modified once a configuration is created.

**[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing**

If this parameter is true then one will be asked to enter **-azure-private-key** without echoing the input. Default value: **true** .

**[-azure-private-key <text>] - Azure Access Key**

This parameter specifies the access key required to authenticate requests to the Azure object store. See also **ask-azure-private-key** . For other object store providers see **-secret-password** .

**[-server-side-encryption {none | SSE-S3}] - Encryption of Data at Rest by the Object Store Server**

This parameter specifies if AWS or other S3 compatible object store server must encrypt data at rest. The available choices depend on provider-type. **none** encryption (no encryption required) is supported by all types of S3 (non-Azure) object store servers. **SSE-S3** encryption is supported by and is a default for all types of S3 (non-Azure) object store servers except ONTAP\_S3. This is an advanced property. In most cases it is best not to change default value of "sse\_s3" for object store servers which support SSE-S3 encryption. The encryption is in addition to any encryption done by ONTAP at a volume or at an aggregate level.

## [-url-style {path-style | virtual-hosted-style}] - URL Style Used to Access S3 Bucket

This parameter specifies the URL style used to access S3 bucket. This option is only available for non-Azure object store providers. The available choices and default value depend on provider-type.

## Examples

## Related Links

- [snapmirror object-store config modify](#)

# snapmirror object-store config delete

Delete SnapMirror object store configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror object-store config delete` command removes an existing object store configuration in Data ONTAP.

## Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the vserver name on which the object store configuration has been configured.

**-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration to be deleted.

## Examples

# snapmirror object-store config modify

Modify SnapMirror object store configuration attributes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store config modify` command is used to update one or more of object store configuration parameters.

## Parameters

### `-vserver <vserver name>` - Vserver Name

This parameter specifies the vserver on which the object store configuration needs to be created.

### `-object-store-name <text>` - Object Store Configuration Name

This parameter identifies the configuration to be modified.

### `[-usage {data|metadata}]` - Object Store Use

This parameter specifies the usage for an object store configuration

### `[-new-object-store-name <text>]` - Object Store Configuration New Name

This optional parameter specifies the new name for the object store configuration.

### `[-server <Remote InetAddress>]` - Fully Qualified Domain Name of the Object Store Server

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server. For Amazon S3, server name must be an AWS regional endpoint in the format `s3.amazonaws.com` or `s3-<region>.amazonaws.com`, for example, `s3-us-west-2.amazonaws.com`. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the `-server` is a `"blob.core.windows.net"` or a `"blob.core.usgovcloudapi.net"`, then the value of `azure-account` in the configuration followed by a period will be added in front of the server. Note that the value of `azure-account` cannot be modified.

### `[-is-ssl-enabled {true|false}]` - Is SSL/TLS Enabled

This optional parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store.

### `[-port <integer>]` - Port Number of the Object Store

This optional parameter specifies a new port number to connect to the object store server indicated in the `-server` parameter.

### `[-access-key <text>]` - Access Key ID for S3 Compatible Provider Types

This optional parameter specifies a new access key (access key ID) for the AWS S3, SGWS, IBM COS object stores and ONTAP S3.

### `[-ipspace <IPspace>]` - IPspace to Use in Order to Reach the Object Store

This optional parameter specifies new ipspace values for the configuration.

### `[-use-iam-role {true|false}]` - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP

This optional parameter is deprecated. Please use `-auth-type` instead. Note, that `-auth-type EC2-IAM` is an equivalent of `-use-iam-role true`, and `-auth-type key` is an equivalent of `-use-iam-role`

`false` .

### **[-secret-password <text>] - Secret Access Key for S3 Compatible Provider Types**

This optional parameter specifies a new password (secret access key) for the AWS S3, SGWS, IBM COS object stores and ONTAP S3. For an Azure object store see `-azure-private-key` . If the `-access-key` is specified but the `-secret-password` is not then one will be asked to enter the `-secret-password` without echoing the input.

### **[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

This optional parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is `true` . It is recommended to keep the default value which is `true` to make sure that Data ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

### **[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing**

If this optional parameter is true then one will be asked to enter the `-azure-private-key` without echoing the input.

### **[-azure-private-key <text>] - Azure Access Key**

This optional parameter specifies a new access key for Azure object store. For other object store providers see `secret-password` . See also `ask-azure-private-key` .

### **[-server-side-encryption {none | SSE-S3}] - Encryption of Data at Rest by the Object Store Server**

This parameter specifies if AWS or other S3 compatible object store server must encrypt data at rest. The available choices depend on provider-type. `none` encryption (no encryption required) is supported by all S3 (non-Azure) object store servers. `SSE-S3` encryption is supported by all S3 (non-Azure) object store servers except ONTAP\_S3. This is an advanced property. In most cases it is best not to change default value of "sse\_s3" for object store servers which support SSE-S3 encryption. The encryption is in addition to any encryption done by ONTAP at a volume or at an aggregate level. Note that changing this option does not change encryption of data which already exist in the object store.

### **[-url-style {path-style | virtual-hosted-style}] - URL Style Used to Access S3 Bucket**

This parameter specifies the URL style used to access S3 bucket. This option is only available for non-Azure object store providers. The available choices and default value depend on provider-type.

## Examples

## Related Links

- [storage aggregate object-store config modify](#)

# snapmirror object-store config show

Display a list of SnapMirror object store configurations

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror object-store config show` command displays information about all existing object store configurations in the cluster.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ -instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver Name`

If this parameter is specified, the command displays information only about object store configurations which are configured within this vserver.

`[-object-store-name <text>] - Object Store Configuration Name`

If this parameter is specified, the command displays information only about object store configurations whose name matches the specified names.

`[-usage {data|metadata}] - Object Store Use`

Specifies what this object store configuration is used for

`[-vsUuid <UUID>] - Vserver UUID`

Vserver UUID

`[-config-id <integer>] - Object Store Configuration ID`

If this parameter is specified, the command displays information only about object store configurations whose configuration ID matches the specified value.

`[-provider-type <providerType>] - Type of the Object Store Provider`

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

`[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server`

If this parameter is specified, the command displays information only about object store

configurations whose server name matches the specified value. The server name is specified as a Fully Qualified Domain Name (FQDN).

**[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

If this parameter is specified, the command displays information only about object store configurations whose status about the use of secured communication over the network matches the specified value.

**[-port <integer>] - Port Number of the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose port numbers matches the specified value.

**[-container-name <text>] - Data Bucket/Container Name**

If this parameter is specified, the command displays information only about object store configurations whose container name matches the specified value. Data ONTAP uses this container name or object store data bucket while accessing data from the object store.

**[-access-key <text>] - Access Key ID for S3 Compatible Provider Types**

If this parameter is specified, the command displays information only about AWS S3, SGWS, IBM COS object store configurations and ONTAP S3 whose access key matches the specified value. Data ONTAP requires the access key for authorized access to the object store.

**[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose IPspace matches the specified value. Data ONTAP uses the IPspace value to connect to the object store.

**[-use-iam-role {true|false}] - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP**

If this parameter is specified, the command displays information only about object store configurations whose IAM role status flag matches the specified value. The `-iam-role` and `-use-iam-role`` parameters are relevant only in the context of AWS object store and indicates whether IAM role must be used for accessing it. The IAM credentials can be obtained only through AWS Cloud Volumes ONTAP.

**[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

If this parameter is specified, the command displays information only about object store configurations whose status about the validation of SSL/TLS certificate matches the specified value.

**[-azure-account <text>] - Azure Account**

If this parameter is specified, the command displays information only about Azure object store configurations whose account matches the specified value. Data ONTAP requires the Azure account for authorized access to the Azure object store.

**[-server-side-encryption {none | SSE-S3}] - Encryption of Data at Rest by the Object Store Server**

If this parameter is specified, the command displays information only about object store configurations whose server-side encryption matches the specified value.

**[-url-style {path-style | virtual-hosted-style}] - URL Style Used to Access S3 Bucket**

If this parameter is specified, the command displays information only about object store configurations whose URL style matches the specified value.

## Examples

# snapmirror object-store profiler abort

Abort object store profiler

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **snapmirror object-store profiler abort** command will abort an ongoing object store profiler run. This command requires two parameters - an object store configuration and a node on which the profiler is currently running.

## Parameters

**-node {<nodename>|local} - Node on Which the Profiler Should Run**

This parameter specifies the node on which the object store profiler is running.

**-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

## Examples

The following example aborts the object store profiler :

```
cluster1::>snapmirror object-store profiler abort -object-store-name my-store -node my-node
```

# snapmirror object-store profiler show

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `snapmirror object-store profiler show` command is used to monitor progress and results of the `snapmirror object-store profiler start` command.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ -instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[ -node <nodename> ] - Node Name`

This parameter specifies the node on which the profiler was started.

`[ -object-store-name <text> ] - ONTAP Name for this Object Store Configuration`

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

`[ -object-name-prefix <UUID> ] - Bin UUID`

This parameter specifies the object name prefix.

`[ -object-prefix <text> ] - Prefix Added to Each Object`

If this parameter is specified, the command displays information only about the objects whose prefix matches the specified prefix.

`[ -profiler-status <text> ] - Profiler Status`

Current status of the profiler.

`[ -start-time <MM/DD/YYYY HH:MM:SS> ] - Profiler Start Time`

Time at which profiler run started.

`[ -op-name <text> ] - Operation Name - PUT/GET`

Name of the operation. Possible values are PUT or GET.

`[ -op-size { <integer>[KB|MB|GB|TB|PB] } ] - Size of Operation`

Size of the PUT or GET operation.

`[ -op-count <integer> ] - Number of Operations Performed`

Number of operations issued to the object store.

`[ -op-failed <integer> ] - Number of Operations Failed`

Number of operations that failed.

**[-op-latency-minimum <integer>] - Minimum Latency for Operation in Milliseconds**

Minimum latency of the operation in milliseconds, as measured from the filesystem layer.

**[-op-latency-maximum <integer>] - Maximum Latency for Operation in Milliseconds**

Maximum latency of the operation in milliseconds, as measured from the filesystem layer.

**[-op-latency-average <integer>] - Average Latency for Operation in Milliseconds**

Average latency of the operation in milliseconds, as measured from the filesystem layer.

**[-op-throughput {<integer>[KB|MB|GB|TB|PB]}] - Throughput per Second for the operation**

Throughput per second for the operation.

**[-op-errors <text>,...] - Error Reasons and Count**

Error reasons and count for failed operation.

**[-op-latency-histogram <text>,...] - Latency Histogram**

Latency histogram for the operation.

## Examples

The following example displays the results of [snapmirror object-store profiler start](#) :

```
cluster1::>snapmirror object-store profiler show
```

## Related Links

- [snapmirror object-store profiler start](#)

# snapmirror object-store profiler start

Start the object store profiler to measure latency and throughput

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **snapmirror object-store profiler start** command writes objects to an object store and reads those objects to measure latency and throughput of an object store. This command requires two parameters - an object store configuration and node from which to send the PUT/GET/DELETE operations. This command verifies whether the object store is accessible through the intercluster LIF of the node on which it runs. The command fails if the object store is not accessible. The command will create a 10GB dataset by doing 2500 PUTs for a maximum time period of 60 seconds. Then it will issue GET operations of different sizes - 4KB, 8KB, 32KB, 256KB for a maximum time period of 180 seconds. Finally it will delete the objects it created. This command can result in additional charges to your object store account. This is a CPU intensive command. It is recommended to run this command

when the system is under 50% CPU utilization.

## Parameters

### **-node {<nodename>|local} - Node on Which the Profiler Should Run**

This parameter specifies the node from which PUT/GET/DELETE operations are sent.

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

### **[-object-prefix <text>] - Prefix Added to Each Object**

This parameter specifies the prefix attached to each object. There is a prefix length restriction of 80 characters. In addition to this restriction, follow any specific prefix length or character restrictions that are imposed by the cloud store they plan to run this command. Refer to the respective cloud store documentation for details.

## Examples

The following example starts the object store profiler :

```
cluster1::>snapmirror object-store profiler start -object-store-name my-store -node  
my-node
```

## snapmirror policy add-rule

Add a new rule to SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **snapmirror policy add-rule** command adds a rule to a SnapMirror policy. Rules define which Snapshot copies are protected by vault relationships or define the schedule at which Snapshot copies are created on the SnapMirror destination. Rules which do not include a schedule are rules for protecting Snapshot copies. Rules which include a schedule are rules for creating Snapshot copies on the SnapMirror destination. A rule with a schedule can only be added to SnapMirror policies of type **vault** or **mirror-vault** . A rule must not be added to a policy that will be associated with a SnapMirror data protection relationship. A policy that will be associated with a SnapMirror vault relationship must have at least one rule and at most ten rules. A SnapMirror policy with rules must have at least one rule without a schedule.

## Parameters

### -vserver <vserver name> - Vserver Name

Specifies the Vserver for the SnapMirror policy.

### -policy <sm\_policy> - SnapMirror Policy Name

Specifies the SnapMirror policy name.

### -snapmirror-label <text> - Snapshot Copy Label

This parameter is primarily used for the purpose of Snapshot copy selection for extended data protection (XDP) relationships. Only Snapshot copies that have a SnapMirror label that matches this parameter will be transferred to the SnapMirror destination. However, when this parameter is associated with a rule containing a schedule, Snapshot copies will be created on the SnapMirror destination using this snapmirror-label parameter. The label can be 31 or fewer characters in length. SnapMirror policies of type **async-mirror** and **mirror-vault** have a rule added for label **sm\_created** at the time of policy creation. This rule cannot be removed or modified by the user. This rule when coupled with **create-snapshot** field set to **true** indicates that the SnapMirror relationship using this policy shall create a new Snapshot copy and transfer it as part of a [snapmirror update](#) operation. SnapMirror policies of type **async-mirror** support one additional rule with SnapMirror label **all\_source\_snapshots**. This rule along with the rule for SnapMirror label **sm\_created** indicates that **all** new Snapshot copies on the primary volume along with the newly created Snapshot copy are transferred as a part of a [snapmirror update](#) or [snapmirror initialize](#) operation. Rules with any other SnapMirror labels cannot be added to SnapMirror policies of type **async-mirror**. The rule for label **sm\_created** when added to a **snapmirror policy** of type **vault** indicates that all SnapMirror created Snapshot copies of the primary volume are selected for transfer.

### -keep <text> - Snapshot Copy Retention Count

Specifies the maximum number of Snapshot copies that are retained on the SnapMirror destination volume for a rule. The total number of Snapshot copies retained for all the rules in a policy cannot exceed 1019. For all the rules in SnapMirror policies of type **async-mirror**, this parameter must be set to value **1**.

### [-preserve {true|false}] - Snapshot Copy Preserve Enabled

Specifies the behavior when the Snapshot copy retention count is reached on the SnapMirror vault destination for the rule. The default value is **false**, which means that the oldest Snapshot copy will be deleted to make room for new ones only if the number of Snapshot copies has exceeded the retention count specified in the "keep" parameter. When set to **true**, and when the Snapshot copies have reached the retention count, then an incremental SnapMirror vault update transfer will fail or if the rule has a schedule, Snapshot copies will no longer be created on the SnapMirror destination. For all the rules in SnapMirror policies of type **async-mirror** this parameter must be set to value **false**.

### [-warn <integer>] - Warning Threshold Count

Specifies the warning threshold count for the rule. The default value is **0**. When set to a value greater than zero, an event is generated after the number of Snapshot copies (for the particular rule) retained on a SnapMirror vault destination reaches the specified warn limit. The preserve

parameter for the rule must be **true** to set the warn parameter to a value greater than zero.

### **[-schedule <text>] - Snapshot Copy Creation Schedule**

This optional parameter specifies the name of the schedule associated with a rule. This parameter is allowed only for rules associated with SnapMirror policies of type **vault** or **mirror-vault**. When this parameter is specified, Snapshot copies are directly created on the SnapMirror destination. The Snapshot copies created will have the same content as the latest Snapshot copy already present on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. The default value is `-`.

You define and name a schedule using the [job schedule cron create](#) command.

### **[-prefix <text>] - Snapshot Copy Creation Prefix**

This optional parameter specifies the prefix for the Snapshot copy name to be created as per the schedule. If no value is specified, then the **snapmirror-label** will be used as the prefix. The prefix parameter can only be specified for rules which have a schedule.

### **[-retention-period {{<integer> days|months|years}}] - Snapshot Copy Retention Period**

This optional parameter specifies the duration for which the Snapshot copies associated with this rule will be locked. This parameter is only allowed for SnapMirror relationships between ONTAP source endpoints and object store destination endpoints. The parameter is specified as a number followed by a suffix. The valid suffixes are **days**, **months**, and **years**. For example, a value of **6months** represents a retention period of 6 months. The minimum value of this parameter is **30days** and maximum value is **100years**. It cannot be specified if the value of the **snapshot-lock-mode** field in the SnapMirror policy is set to **none**. The default value is **30days** when the value of the **snapshot-lock-mode** field in the SnapMirror policy is set to **compliance** or **enterprise** and the retention period is not specified.

## Examples

The following example adds a rule named **nightly** to the SnapMirror policy named **TieredBackup** on Vserver **vs0.example.com**. The rule will retain a maximum of **5 nightly** Snapshot copies.

```
vs0.example.com::> snapmirror policy add-rule -vserver vs0.example.com
-policy TieredBackup -snapmirror-label nightly -keep 5
```

# snapmirror policy create

Create a new SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy create` command creates a SnapMirror policy. When applied to a SnapMirror relationship, the SnapMirror policy controls the behavior of the relationship and specifies the configuration attributes for that relationship. The policies **DPDefault** , **MirrorAllSnapshots** , **MirrorAndVault** , **MirrorLatest** , **Unified7year** and **XDPDefault** are created by the system for asynchronous replication. The policies **Sync** and **StrictSync** are created by the system for synchronous replication.

All SnapMirror policies have a field **create-snapshot** . This field specifies whether SnapMirror creates a new Snapshot copy on the primary volume at the beginning of a `snapmirror update` or `snapmirror resync` operation. Currently this field cannot be set or modified by the user. It is set to **true** for SnapMirror policies of type **async-mirror** and **mirror-vault** at the time of creation. SnapMirror policies of type **vault** have **create-snapshot** set to **false** at the time of creation.

Use the `snapmirror policy add-rule` command to add a rule to a policy.

## Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the Vserver for the SnapMirror policy.

**-policy <sm\_policy> - SnapMirror Policy Name**

This parameter specifies the SnapMirror policy name. A policy name can be made up of the characters A to Z, a to z, 0 to 9, ".", "-", and "\_". The name can be up to 256 characters in length.

**[-type {vault|async-mirror|mirror-vault|strict-sync-mirror|sync-mirror|automated-failover|continuous}] - Snapmirror Policy Type**

This parameter specifies the SnapMirror policy type. The supported values are **async-mirror** , **vault** , **mirror-vault** , **sync-mirror** and **strict-sync-mirror** . Data protection (DP) relationships support only **async-mirror** policy type, while extended data protection (XDP) relationships support all policy types.

If the type is set to **async-mirror** then the policy is for Disaster Recovery. When the policy type is associated with extended data protection (XDP) relationships, `snapmirror resync` operations transfer selected Snapshot copies from the primary volume to the secondary volume. The selection of Snapshot copies is governed by the rules in the policy. However `snapmirror initialize` and `snapmirror update` operations on data protection (DP) relationships ignore the rules in the

policy and transfer **all** Snapshot copies of the primary volume which are newer than the common Snapshot copy on the destination. For both data protection (DP) and extended data protection (XDP) relationships, the Snapshot copies are kept on the secondary volume as long as they exist on the primary volume. Once a protected Snapshot copy is deleted from the primary volume, it is deleted from the secondary volume as part of the next transfer. The policy type supports rules with certain pre-defined label names only. Refer to the man page for the [snapmirror policy add-rule](#) command for the details.

If the type is set to **vault** then the policy is used for Backup and Archive. The rules in this policy type determine which Snapshot copies are protected and how long they are retained on the secondary volume. This policy type is supported by extended data protection (XDP) relationships only.

If the type is set to **mirror-vault** then the policy is used for unified data protection which provides both Disaster Recovery and Backup using the same secondary volume. This policy type is supported by extended data protection (XDP) relationships only.

If the type is set to **sync-mirror** or **strict-sync-mirror** then the policy is used for synchronous Disaster Recovery. These are supported only by extended data protection (XDP) relationships between FlexVol volumes. Once the relationship is initialized with [snapmirror initialize](#) , the relationship will be InSync such that all writes to the primary will be replicated to the secondary before the write is acknowledged to the client. Upon a replication failure, relationship falls OutOfSync. Upon an OutOfSync event, the **strict-sync-mirror** variant restricts further client IO on the primary, whereas the **sync-mirror** variant does not. SnapMirror will automatically trigger resync to bring the OutOfSync relationships back InSync as soon as it can, unless the relationship is **Quiesced** or **Broken-off** . Once a relationship is initialized, you normally use the [snapmirror quiesce](#) command to stop synchronous replication and the [snapmirror resume](#) command to resume synchronous replication. These policy types do not support replication of user Snapshot copies.

#### **[-comment <text>] - Comment**

Specifies a text comment for the SnapMirror policy. If the comment contains spaces, it must be enclosed within quotes.

#### **[-tries <unsigned32\_or\_unlimited>] - Tries Limit**

Determines the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The value of this parameter must be a positive integer or **unlimited** . The default value is **8** .

#### **[-transfer-priority {low|normal}] - Transfer Scheduling Priority**

Specifies the priority at which a transfer runs. The supported values are **normal** or **low** . The **normal** transfers are scheduled before the **low** priority transfers. The default is **normal** .

#### **[-ignore-atime {true|false}] - Ignore File Access Time**

This parameter applies only to extended data protection (XDP) relationships. It specifies whether incremental transfers will ignore files which have only their access time changed. The supported values are **true** or **false** . The default is **false** .

**[-restart {always|never|default}] - Restart Behavior**

This parameter applies only to data protection relationships. It defines the behavior of SnapMirror if an interrupted transfer exists. The supported values are **always**, **never**, or **default**. If the value is set to **always**, an interrupted SnapMirror transfer always restarts provided it has a restart checkpoint and the conditions are the same as they were before the transfer was interrupted. In addition, a new SnapMirror Snapshot copy is created which will then be transferred. If the value is set to **never**, an interrupted SnapMirror transfer will never restart, even if a restart checkpoint exists. A new SnapMirror Snapshot copy will still be created and transferred. Data ONTAP version 8.2 will interpret a value of **default** as being the same as **always**. Vault transfers will always resume based on a restart checkpoint, provided the Snapshot copy still exists on the source volume.

**[-is-network-compression-enabled {true|false}] - Is Network Compression Enabled**

Specifies whether network compression is enabled for transfers. The supported values are **true** or **false**. The default is **false**.

**[-rpo <integer>] - Recovery Point Objective (seconds)**

Specifies the time for recovery point objective, in seconds. This parameter is only supported for a policy of type **continuous**.

**[-always-replicate-snapshots {true|false}] - This prioritizes replication of app-consistent snapshots over synchronous replication**

If this parameter is set to true, it specifies that SnapMirror Synchronous relationships will lose the zero RPO protection upon failure in replicating application created snapshots. The default value is false.

**[-retention-period {{<integer> days|months|years}}] - Snapshot Copy Retention Period**

This optional parameter specifies the duration for which the Snapshot copies associated with this rule will be locked. This parameter is only allowed for SnapMirror relationships between ONTAP source endpoints and object store destination endpoints. The parameter is specified as a number followed by a suffix. The valid suffixes are **days**, **months**, and **years**. For example, a value of **6months** represents a retention period of 6 months. The minimum value of this parameter is **30days** and maximum value is **100years**. It cannot be specified if the value of the **snapshot-lock-mode** field in the SnapMirror policy is set to **none**. The default value is **30days** when the value of the **snapshot-Lock-mode** field in the SnapMirror policy is set to **compliance** or **enterprise** and the retention period is not specified.

**[-common-snapshot-schedule <text>] - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous**

Specifies the common Snapshot creating schedule. This parameter is only supported for SnapMirror Synchronous relationships.

**[-are-data-ops-sequentially-split {true|false}] - Is Sequential Splitting of Data Operations Enabled?**

This parameter specifies whether I/O, such as write, copy-offload and punch-holes, are split sequentially, rather than being run in parallel on the source and destination. Splitting I/O sequentially will make the system more robust, and less prone to I/O errors. Starting 9.11.1,

enabling this feature improves the performance when the workload is NAS based and is metadata heavy. However, it will make the IO performance slower for large file workloads like LUNs, databases, virtualization containers, etc. The default value for the parameter `-are-data-ops-sequentially-split` is **false** . The parameter `-are-data-ops-sequentially-split` should only be used if frequent I/O timeout or "OutOfSync" has happened. The parameter `-are-data-ops-sequentially-split` requires an effective cluster version of Data ONTAP 9.6.0 or later on both the source and destination clusters.

#### `[-sequential-split-op-timeout-secs <integer>]` - Sequential Split Op Timeout in Seconds

This parameter specifies the op timeout value used when the splitting mode is sequential. This parameter is used only for Sync relationships. Supported values are from 15 to 25 seconds.

#### `[-disable-fast-resync {true|false}]` - Disable Fast Resync

Specifies whether fast resync for a SnapMirror Synchronous relationship is disabled or not. The default value for this parameter is **false** .

#### `[-discard-configs <network>, ...]` - Configurations Not Replicated During Identity Preserve Vserver DR

Specifies the configuration to be dropped during replication. The supported values are:

- **network** - Drops network interfaces, routes, and kerberos configuration.

This parameter is supported only for policies of type **async-mirror** and applicable only for identity-preserve Vserver SnapMirror relationships.

#### `[-transfer-schedule-name <text>]` - Transfer Schedule Name

This optional parameter specifies the schedule which is used to update the SnapMirror relationships.

#### `[-throttle <throttleType>]` - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for transfers. It configures for the relationships the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationships fully utilize the network bandwidth available. You can also configure the relationships to fully use the network bandwidth available by explicitly setting the throttle to **unlimited** or **0** . The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between **1** and **4** , it will be treated as **4** . For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship.

## Examples

The following example creates a SnapMirror policy named **TieredBackup** on a Vserver named **vs0.example.com** .

```
vs0.example.com::> snapmirror policy create -vserver vs0.example.com
-policy TieredBackup -type vault -tries 10 -restart never
```

# snapmirror policy delete

Delete a SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy delete` command deletes a SnapMirror policy. A policy that is to be deleted must not be associated with any SnapMirror relationship. The built-in policies cannot be deleted.

## Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the Vserver for the SnapMirror policy.

**-policy <sm\_policy> - SnapMirror Policy Name**

Specifies the SnapMirror policy name.

## Examples

The following example deletes a SnapMirror policy named **TieredBackup** on Vserver **vs0.example.com** :

```
vs0.example.com::> snapmirror policy delete -vserver vs0.example.com
-policy TieredBackup
```

# snapmirror policy modify-rule

Modify an existing rule in SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy modify-rule` command can be used to modify the retention count, preserve setting, warning threshold count, schedule, and prefix for a rule in a SnapMirror policy. Reducing the retention count or disabling the preserve setting for a rule in a SnapMirror policy might result in the deletion of Snapshot copies on the vault destination when the next transfer by the `snapmirror update` command occurs or when the next scheduled Snapshot copy creation on the destination for the rule occurs. Modifying a rule to add a schedule will enable creation of Snapshot copies on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. Schedule and prefix can only be modified for rules associated with SnapMirror policies of type `vault` or `mirror-vault`. A SnapMirror policy with rules must have at least one rule without a schedule.

The rules in SnapMirror policies of type `async-mirror` cannot be modified.

## Parameters

### `-vserver <vserver name>` - Vserver Name

Specifies the Vserver for the SnapMirror policy.

### `-policy <sm_policy>` - SnapMirror Policy Name

Specifies the SnapMirror policy name.

### `-snapmirror-label <text>` - Snapshot Copy Label

This parameter specifies the rule that is to be modified in a SnapMirror policy.

### `[-keep <text>]` - Snapshot Copy Retention Count

Specifies the maximum number of Snapshot copies that are retained on the SnapMirror destination volume for a rule. The total number of Snapshot copies retained for all the rules in a policy cannot exceed 1019. For all the rules in SnapMirror policies of type `async-mirror`, this parameter must be set to value `1`.

### `[-preserve {true|false}]` - Snapshot Copy Preserve Enabled

Specifies the behavior when the Snapshot copy retention count is reached on the SnapMirror vault destination for the rule. The default value is `false`, which means that the oldest Snapshot copy will be deleted to make room for new ones only if the number of Snapshot copies has exceeded the retention count specified in the "keep" parameter. When set to `true`, and when the Snapshot copies have reached the retention count, then an incremental SnapMirror vault update transfer will fail or if the rule has a schedule, Snapshot copies will no longer be created on the SnapMirror destination. For all the rules in SnapMirror policies of type `async-mirror` this parameter must be set to value `false`.

### `[-warn <integer>]` - Warning Threshold Count

Specifies the warning threshold count for the rule. The default value is `0`. When set to a value greater than zero, an event is generated after the number of Snapshot copies (for the particular rule) retained on a SnapMirror vault destination reaches the specified warn limit. The preserve parameter for the rule must be `true` to set the warn parameter to a value greater than zero.

### **[-schedule <text>] - Snapshot Copy Creation Schedule**

This optional parameter specifies the name of the schedule associated with a rule. This parameter is allowed only for rules associated with SnapMirror policies of type **vault** or **mirror-vault**. When this parameter is specified, Snapshot copies are directly created on the SnapMirror destination. The Snapshot copies created will have the same content as the latest Snapshot copy already present on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. The default value is -.

You define and name a schedule using the [job schedule cron create](#) command.

### **[-prefix <text>] - Snapshot Copy Creation Prefix**

This optional parameter specifies the prefix for the Snapshot copy name to be created as per the schedule. If no value is specified, then the **snapmirror-label** will be used as the prefix. The prefix parameter can only be specified for rules which have a schedule.

### **[-retention-period {{<integer> days|months|years}}] - Snapshot Copy Retention Period**

This optional parameter specifies the duration for which the Snapshot copies associated with this rule will be locked. This parameter is only allowed for SnapMirror relationships between ONTAP source endpoints and object store destination endpoints. The parameter is specified as a number followed by a suffix. The valid suffixes are **days**, **months**, and **years**. For example, a value of **6months** represents a retention period of 6 months. The minimum value of this parameter is **30days** and maximum value is **100years**. It cannot be specified if the value of the **snapshot-lock-mode** field in the SnapMirror policy is set to **none**. The default value is **30days** when the value of the **snapshot-lock-mode** field in the SnapMirror policy is set to **compliance** or **enterprise** and the retention period is not specified.

## Examples

The following example changes the retention count for **nightly** Snapshot copies to **6** for a rule named **nightly** on a SnapMirror policy named **TieredBackup** on Vserver **vs0.example.com**:

```
vs0.example.com::> snapmirror policy modify-rule -vserver vs0.example.com
-policy TieredBackup -snapmirror-label nightly -keep 6
```

## Related Links

- [snapmirror update](#)
- [job schedule cron create](#)

# snapmirror policy modify

Modify a SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy modify` command can be used to modify the policy attributes.

Use the `snapmirror policy modify-rule` command to modify a rule in a SnapMirror policy.

## Parameters

### `-vserver <vserver name>` - Vserver Name

Specifies the Vserver for the SnapMirror policy.

### `-policy <sm_policy>` - SnapMirror Policy Name

Specifies the SnapMirror policy name.

### `[-comment <text>]` - Comment

Specifies a text comment for the SnapMirror policy. If the comment contains spaces, it must be enclosed within quotes.

### `[-tries <unsigned32_or_unlimited>]` - Tries Limit

Determines the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The value of this parameter must be a positive integer or **unlimited**. The default value is **8**.

### `[-transfer-priority {low|normal}]` - Transfer Scheduling Priority

Specifies the priority at which a transfer runs. The supported values are **normal** or **low**. The **normal** transfers are scheduled before the **low** priority transfers. The default is **normal**.

### `[-ignore-atime {true|false}]` - Ignore File Access Time

This parameter applies only to extended data protection (XDP) relationships. It specifies whether incremental transfers will ignore files which have only their access time changed. The supported values are **true** or **false**. The default is **false**.

### `[-restart {always|never|default}]` - Restart Behavior

This parameter applies only to data protection relationships. It defines the behavior of SnapMirror if an interrupted transfer exists. The supported values are **always**, **never**, or **default**. If the value is set to **always**, an interrupted SnapMirror transfer always restarts provided it has a restart checkpoint and the conditions are the same as they were before the transfer was interrupted. In addition, a new SnapMirror Snapshot copy is created which will then be transferred. If the value is set to **never**, an interrupted SnapMirror transfer will never restart, even if a restart checkpoint exists. A new SnapMirror Snapshot copy will still be created and transferred. Data ONTAP version 8.2 will interpret a value of **default** as being the same as **always**. Vault transfers will always resume based on a restart checkpoint, provided the Snapshot copy still exists on the source volume.

### `[-is-network-compression-enabled {true|false}]` - Is Network Compression Enabled

Specifies whether network compression is enabled for transfers. The supported values are **true** or

**false** . The default is **false** .

### **[-rpo <integer>] - Recovery Point Objective (seconds)**

Specifies the time for recovery point objective, in seconds. This parameter is only supported for a policy of type **continuous** .

### **[-always-replicate-snapshots {true|false}] - This prioritizes replication of app-consistent snapshots over synchronous replication**

If this parameter is set to true, it specifies that SnapMirror Synchronous relationships will lose the zero RPO protection upon failure in replicating application created snapshots. The default value is false.

### **[-retention-period {{<integer> days|months|years}}] - Snapshot Copy Retention Period**

This optional parameter specifies the duration for which the Snapshot copies associated with this rule will be locked. This parameter is only allowed for SnapMirror relationships between ONTAP source endpoints and object store destination endpoints. The parameter is specified as a number followed by a suffix. The valid suffixes are **days** , **months** , and **years** . For example, a value of **6months** represents a retention period of 6 months. The minimum value of this parameter is **30days** and maximum value is **100years** . It cannot be specified if the value of the **snapshot-lock-mode** field in the SnapMirror policy is set to **none** . The default value is **30days** when the value of the **snapshot-lock-mode** field in the SnapMirror policy is set to **compliance** or **enterprise** and the retention period is not specified.

### **[-common-snapshot-schedule <text>] - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous**

Specifies the common Snapshot creating schedule. This parameter is only supported for Snapmirror Synchronous relationships.

### **[-are-data-ops-sequentially-split {true|false}] - Is Sequential Splitting of Data Operations Enabled?**

This parameter specifies whether I/O, such as write, copy-offload and punch-holes, are split sequentially, rather than being run in parallel on the source and destination. Splitting the I/O sequentially will make the system more robust, and less prone to I/O errors. Starting 9.11.1, enabling this feature improves the performance when the workload is NAS based and is metadata heavy. However, it will make the IO performance slower for large file workloads like LUNs, databases, virtualization containers, etc. The default value of parameter **-sequential-split-data-ops** is **false** . The parameter **-are-data-ops-sequentially-split** should only be used if frequent I/O timeout or "OutOfSync" has happened. Changes made by the **snapmirror policy modify -sequential-split-data-ops** command do not take effect until the next resync. Changes do not affect resync or initialize operations that have started and have not finished yet. The parameter **-are- data-ops-sequentially-split** requires an effective cluster version of Data ONTAP 9.6.0 or later on both the source and destination clusters.

### **[-sequential-split-op-timeout-secs <integer>] - Sequential Split Op Timeout in Seconds**

This parameter specifies the op timeout value used when the splitting mode is sequential. This parameter is used only for Sync relationships. Supported values are from 15 to 25 seconds. The default value of the parameter **-sequential-split-op-timeout** is **15 seconds** . Changes made by the

`snapmirror policy modify -sequential-split-op-timeout-secs` command do not take effect until the next resync. Changes do not affect resync or initialize operations that have started and have not finished yet.

#### `[-disable-fast-resync {true|false}] - Disable Fast Resync`

Specifies whether fast resync for a SnapMirror Synchronous relationship is disabled or not. The default value for this parameter when a policy is created is **false**.

#### `[-discard-configs <network>, ...] - Configurations Not Replicated During Identity Preserve Vserver DR`

Specifies the configuration to be dropped during replication. The supported values are:

- **network** - Drops network interfaces, routes, and kerberos configuration.

This parameter is supported only for policies of type **async-mirror** and applicable only for identity-preserve Vserver SnapMirror relationships.

#### `[-transfer-schedule-name <text>] - Transfer Schedule Name`

This optional parameter specifies the schedule which is used to update the SnapMirror relationships.

#### `[-throttle <throttleType>] - Throttle (KB/sec)`

This optional parameter limits the network bandwidth used for transfers. It configures for the relationships the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationships fully utilize the network bandwidth available. You can also configure the relationships to fully use the network bandwidth available by explicitly setting the throttle to **unlimited** or **0**. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between **1** and **4**, it will be treated as **4**. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship.

## Examples

The following example changes the "transfer-priority" and the "comment" text of a snapmirror policy named **TieredBackup** on Vserver **vs0.example.com**:

```
vs0.example.com::> snapmirror policy modify -vserver vs0.example.com -policy TieredBackup -transfer-priority low -comment "Use for tiered backups"
```

## Related Links

- [snapmirror policy modify-rule](#)

# snapmirror policy remove-rule

Remove a rule from SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy remove-rule` command removes a rule from a SnapMirror policy. On the destination of a SnapMirror relationship with `snapmirror policy` of type `vault` or `mirror-vault`, all Snapshot copies with a SnapMirror label matching the rule being removed are no longer processed by SnapMirror and might need to be deleted manually. A `snapmirror policy` of type `vault` must have at least one rule if that policy is associated with a SnapMirror relationship. A SnapMirror policy with rules must have at least one rule without a schedule.

## Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the Vserver for the SnapMirror policy.

**-policy <sm\_policy> - SnapMirror Policy Name**

Specifies the SnapMirror policy name.

**-snapmirror-label <text> - Snapshot Copy Label**

This parameter specifies the rule that is removed from the SnapMirror policy.

The rule for SnapMirror label `sm_created` cannot be removed from SnapMirror policies of type `async-mirror` or `mirror-vault`.

## Examples

The following example removes a rule named `nightly` from a SnapMirror policy named `TieredBackup` on Vserver `vs0.example.com`:

```
vs0.example.com::> snapmirror policy remove-rule -vserver vs0.example.com -policy TieredBackup -snapmirror-label nightly
```

## snapmirror policy show

Show SnapMirror policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy show` command displays the following information about SnapMirror policies:

- Vserver Name
- SnapMirror Policy Name
- SnapMirror Policy Type
- Number of Rules in the policy
- Tries
- Transfer Priority
- Comment for the policy
- Individual Rule Names
- Keep value for the Rule
- Total of Keep values across all Rules in the policy

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Selects the policies that match this parameter value.

**[-policy <sm\_policy>] - SnapMirror Policy Name**

Selects the policies that match this parameter value.

**[-type {vault|async-mirror|mirror-vault|strict-sync-mirror|sync-mirror|automated-failover|continuous}] - Snapmirror Policy Type**

Selects the policies that match this parameter value. A policy can be of type **async-mirror** , **vault** or **mirror-vault** .

**[-owner {cluster-admin|vserver-admin}] - Owner of the Policy**

Selects the policies that match this parameter value. A policy can be owned by either the **"Cluster Admin"** or a **"Vserver Admin"** .

**[-comment <text>] - Comment**

Selects the policies that match this parameter value.

**[-tries <unsigned32\_or\_unlimited>] - Tries Limit**

Selects the policies that match this parameter value.

**[-transfer-priority {low|normal}] - Transfer Scheduling Priority**

Selects the policies that match this parameter value.

**[-ignore-atime {true|false}] - Ignore File Access Time**

Selects the policies that match this parameter value.

**[-restart {always|never|default}] - Restart Behavior**

Selects the policies that match this parameter value.

**[-is-network-compression-enabled {true|false}] - Is Network Compression Enabled**

Selects the policies that match this parameter value.

**[-create-snapshot {true|false}] - Create a New Snapshot Copy**

Selects the policies that match this parameter value.

**[-rpo <integer>] - Recovery Point Objective (seconds)**

Selects the policies that match this parameter value.

**[-always-replicate-snapshots {true|false}] - This prioritizes replication of app-consistent snapshots over synchronous replication**

Selects the policies that match this parameter value.

**[-snapmirror-label <text>,...] - Snapshot Copy Label**

Selects the policies that match this parameter value.

**[-keep <text>,...] - Snapshot Copy Retention Count**

Selects the policies that match this parameter value.

**[-preserve {true|false}] - Snapshot Copy Preserve Enabled**

Selects the policies that match this parameter value.

**[-warn <integer>,...] - Warning Threshold Count**

Selects the policies that match this parameter value.

**[-schedule <text>,...] - Snapshot Copy Creation Schedule**

Selects the policies that match this parameter value.

**[-prefix <text>,...] - Snapshot Copy Creation Prefix**

Selects the policies that match this parameter value.

**[-retention-period {{<integer> days|months|years}}] - Snapshot Copy Retention Period**

This optional parameter specifies the duration for which the Snapshot copies associated with this rule will be locked. This parameter is only allowed for SnapMirror relationships between ONTAP source endpoints and object store destination endpoints. The parameter is specified as a number followed by a suffix. The valid suffixes are **days** , **months** , and **years** . For example, a value of **6months** represents a retention period of 6 months. The minimum value of this parameter is **30days** and maximum value is **100years** . It cannot be specified if the value of the **snapshot-lock-mode** field in the SnapMirror policy is set to **none** . The default value is **30days** when the value of the **snapshot-Lock-mode** field in the SnapMirror policy is set to **compliance** or **enterprise** and the retention period is not specified.

**[-total-rules <integer>] - Total Rules in the Policy**

Selects the policies that match this parameter value.

**[-total-keep <integer>] - Total Retention Count for All Rules in the Policy**

Selects the policies that match this parameter value.

**[-common-snapshot-schedule <text>] - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous**

Selects the policies that match this parameter value.

**[-are-data-ops-sequentially-split {true|false}] - Is Sequential Splitting of Data Operations Enabled?**

Selects the policies that match this parameter value.

**[-sequential-split-op-timeout-secs <integer>] - Sequential Split Op Timeout in Seconds**

Selects the policies that match this parameter value.

**[-disable-fast-resync {true|false}] - Disable Fast Resync**

Selects the policies that match this parameter value.

**[-discard-configs <network>, ...] - Configurations Not Replicated During Identity Preserve Vserver DR**

Selects the policies that match this parameter value.

**[-transfer-schedule-name <text>] - Transfer Schedule Name**

Selects the policies that match this parameter value.

**[-throttle <throttleType>] - Throttle (KB/sec)**

Selects the policies that match this parameter value.

## Examples

The following example displays information about all SnapMirror policies:

```
cs::> snapmirror policy show
Vserver Policy      Policy Number      Transfer
Name   Name              Type   Of Rules Tries Priority Comment
-----
cs     DPDefault         async-mirror 2      8  normal Asynchronous SnapMirror
policy for mirroring all Snapshot copies and the latest active file system.
  SnapMirror Label: sm_created                      Keep:      1
                  all_source_snapshots              Total Keep: 2

cs     MirrorAllSnapshots async-mirror 2      8  normal Asynchronous SnapMirror
policy for mirroring all Snapshot copies and the latest active file system.
  SnapMirror Label: sm_created                      Keep:      1
                  all_source_snapshots              1
```

```

Total Keep:      2

cs      MirrorAndVault      mirror-vault 3      8 normal A unified Asynchronous
SnapMirror and SnapVault policy for mirroring the latest active file system and daily
and weekly Snapshot copies.
  SnapMirror Label: sm_created      Keep:      1
                        daily      7
                        weekly      52
Total Keep:      60

cs      MirrorLatest      async-mirror 1      8 normal Asynchronous SnapMirror
policy for mirroring the latest active file system.
  SnapMirror Label: sm_created      Keep:      1
Total Keep:      1

vs0.example.com
  TieredBackup      vault      0      8 normal Use for tiered backups
  Snapmirror-label: -      Keep:      -
Total Keep:      0

cs      Unified7year      mirror-vault 4      8 normal Unified SnapMirror policy with
7year retention.
  SnapMirror Label: sm_created      Keep:      1
                        daily      7
                        weekly      52
                        monthly      84
Total Keep:      144

cs      XDPDefault      vault      2      8 normal Vault policy with daily and
weekly rules.
  SnapMirror Label: daily      Keep:      7
                        weekly      52
Total Keep:      59

7 entries were displayed.
```

The following example shows all the policies with the following fields - vserver (default), policy (default) and transfer-priority:

```

cs::> snapmirror policy show -fields transfer-priority
vserver      policy      transfer-priority
-----
cs      DPDefault normal
cs      MirrorAllSnapshots
                        normal

                        normal
cs      MirrorLatest
                        normal

vs0.example.com
```

```

TieredBackup
cs    Unified7year    normal
cs    XDPDefault      normal
7 entries were displayed.

```

## snapmirror snapshot-owner create

Add an owner to preserve a Snapshot copy for a SnapMirror mirror-to-vault cascade configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror snapshot-owner create` command adds an owner on the specified Snapshot copy. A Snapshot copy can have at most one owner. An owner can only be added to a Snapshot copy on a read-write volume. The Snapshot copy must have a valid SnapMirror label.

Refer to the **ONTAP Data Protection Guide** for valid use cases to add an owner on a Snapshot copy.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume.

**-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the Snapshot copy.

**[-owner <owner name>] - Snapshot Copy Owner Name**

This parameter specifies the name of the owner for the Snapshot copy. The owner name can be made up of the characters A to Z, a to z, 0 to 9, and "\_". The name can be up to 32 characters in length. When not specified, an owner will be added with a system-generated default name.

### Examples

The following example adds owner **app1** on Snapshot copy **snap1** on volume **vol1** in Vserver **vs0.example.com**.

```
cluster1::> snapmirror snapshot-owner create -vserver vs0.example.com
           -volume vol1 -snapshot snap1 -owner app1
```

The following example adds a default owner on Snapshot copy **snap2** on volume **vol1** in Vserver **vs0.example.com**.

```
cluster1::> snapmirror snapshot-owner create -vserver vs0.example.com
           -volume vol1 -snapshot snap2
```

## snapmirror snapshot-owner delete

Delete an owner used to preserve a Snapshot copy for a SnapMirror mirror-to-vault cascade configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The **snapmirror snapshot-owner delete** command removes an owner on the specified Snapshot copy, which was added using the [snapmirror snapshot-owner create](#) command.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume.

**-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the Snapshot copy.

**[-owner <owner name>] - Snapshot Copy Owner Name**

This parameter specifies the name of the owner for the Snapshot copy. When not specified, the owner with the system-generated default name will be removed.

### Examples

The following example removes owner **app1** on Snapshot copy **snap1** on volume **vol1** in Vserver **vs0.example.com**.

```
cluster1::> snapmirror snapshot-owner delete -vserver vs0.example.com
```

```
-volume vol1 -snapshot snap1 -owner app1
```

The following example removes the default owner on Snapshot copy **snap2** on volume **vol1** in Vserver **vs0.example.com**.

```
cluster1::> snapmirror snapshot-owner delete -vserver vs0.example.com
-volume vol1 -snapshot snap2
```

# snapmirror snapshot-owner show

Display Snapshot Copies with Owners

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror snapshot-owner show` command is used to list all Snapshot copies with owners that were added using the [snapmirror snapshot-owner create](#) command.

## Parameters

`{ [-fields <fieldname>,...]`

If this parameter is specified, the command displays information about the specified fields.

`[-instance ] }`

If this parameter is specified, the command displays detailed information about all fields.

`-vserver <vserver name> - Vserver Name`

This parameter specifies the Vserver on which the volume is located.

`-volume <volume name> - Volume Name`

This parameter specifies the name of the volume.

`[-snapshot <snapshot name>] - Snapshot Copy Name`

If this parameter is specified, the command displays the owner name for the specified Snapshot copy.

## Examples

The following example lists all Snapshot copies with owners on volume **vol1** in Vserver **vs0** . The system-generated default owner name is displayed as "-".

```
cluster1::> snapmirror snapshot-owner show
  -vserver vs0.example.com -volume vol1
Vserver Volume          Snapshot          Owner Names
-----
vs0.example.com
      vol1             snap2            -
                        snap1            app1
```

The following example displays the owner name for Snapshot copy **snap1** on volume **vol1** in Vserver **vs0.example.com** .

```
cluster1::> snapmirror snapshot-owner show
  -vserver vs0.example.com -volume vol1 -snapshot snap1
Vserver: vs0.example.com
  Volume: vol1
  Snapshot: snap1
  Owner Names: app1
```

# statistics show-periodic

Continuously display current performance data at regular interval

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command continuously displays specified performance data at a regular interval. The command output displays data in the following columns:

This command has been deprecated and may be removed from a future version of Data ONTAP. Use the "statistics show" command with the tabular format instead.

- **cpu avg:** Average processor utilization across all processors in the system.
- **cpu busy:** Overall system utilization based on CPU utilization and subsystem utilization. Examples of subsystems include the storage subsystem and RAID subsystem.

- total ops: Number of total operations per second.
- nfs-ops: Number of NFS operations per second.
- cifs-ops: Number of CIFS operations per second.
- fcache ops: Number of 7M flexcache operations per second.
- pkts recv: Number of packets received over physical ports per second.
- pkts sent: Number of packets sent over physical ports per second.
- total recv: Total network traffic received over physical ports per second (KBps).
- total sent: Total network traffic sent over physical ports per second (KBps).
- data busy: The percentage of time that data ports sent or received data.
- data recv: Network traffic received on data ports (KBps).
- data sent: Network traffic sent on data ports (KBps).
- cluster busy: The percentage of time that cluster ports sent or received data.
- cluster recv: Network traffic received on cluster ports (KBps).
- cluster sent: Network traffic sent on cluster ports (KBps).
- disk read: Data read from disk (KBps).
- disk write: Data written to disk (KBps).

## Parameters

### **[-object <text>] - Object**

Selects the object for which you want to display performance data. The default object is "**cluster**".

### **[-instance <text>] - Instance**

Selects the instance for which you want to display performance data. This parameter is required if you specify the **-object** parameter and enter any object other than "**cluster**". Multiple values for this parameter are not supported.

For example, if you want to display disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view.

### **[-counter <text>] - Counter**

Selects the counters for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the counters in the specified objects. To specify multiple counters, use "|" between each counter.

### **[-preset <text>] - Preset**

If this parameter is specified, the command displays statistics for the specified preset.

### **[-node {<nodename>|local}] - Node**

Selects the nodes for which you want to display performance data. The default node is

"cluster:summary".

**[-vserver <vserver name>] - Vserver**

Selects the Vserver for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the Vservers in the cluster.

**[-interval <integer>] - Interval in Seconds**

Specifies, in seconds, the interval between statistics updates. The default setting is 1 second.

**[-iterations <integer>] - Number of Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 0 (zero); this means that the command continues to run until you interrupt it by pressing Ctrl-C.

**[-summary {true|false}] - Print Summary**

Specifies whether the command prints a final summary of statistics after the command has gone through all of its iterations. The default setting is **true**.

**[-filter <text>] - Filter Data**

Selects instances that match the specified filter criteria. For example, to display instances from node1, specify **-filter "node\_name=node1"**.

## Examples

The following example displays the "cluster" statistics for a node named node1. Because no number of iterations is specified, this command will continue to run until you interrupt it by pressing Ctrl-C.

```
cluster1::*> statistics show-periodic -node node1
cpu  cpu  cpu  total          fcache  pkts  pkts  total  total
data  data  data  data cluster  cluster  cluster  disk  disk  total  total
avg busy total  ops  nfs-ops  cifs-ops  ops  recv  sent  recv  sent
busy  recv  sent  busy  recv  sent  read  write
-----

5%      1245
4%      1128
[...]

```

## statistics show

Display performance data for a time interval

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays performance data for a period of time .

To display data for a period of time, collect a sample using the [statistics start](#) and [statistics stop](#) commands. The data that displays is calculated data based on the samples the cluster collects. To view the sample, specify the `-sample-id` parameter.

## Parameters

### `[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### `[-tab ]`

If this parameter is specified, the command displays performance data in tabular format.

### `[-object <text>] - Object`

Selects the objects for which you want to display performance data. To view a list of valid object names, type `statistics show-object '?'` or [statistics catalog object show](#) . To specify multiple objects, use `"|"` between each object.

You should limit the scope of this command to only a few objects at a time to avoid a potentially significant impact on the performance of the system.

### `[-instance <text>] - Instance`

Selects the instances for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the instances associated with the specified objects. To specify multiple instances, use `"|"` between each instance.

For example, if you want to display disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view. If you do not specify this parameter, the command displays statistics for all disks in the system.

### `[-counter <text>] - Counter`

Selects the counters for which you want to display performance data. To specify multiple counters, use `"|"` between each counter.

### `[-preset <text>] - Preset`

If this parameter is specified, the command displays statistics for the specified preset.

### `[-node {<nodename>|local}] - Node`

Selects the nodes for which you want to display performance data.

### `[-vserver <vserver name>] - Vserver`

Selects the Vserver for which you want to display performance data.

### `[-value <text>] - Text Value`

Selects the performance data that matches the specified counter value.

**[-labels <text>,...] - List of Labels**

Selects the performance data that matches the specified label.

**[-values <text>,...] - List of Values**

Displays only the statistics that have the specified values.

**[-filter <text>] - Filter Data**

Selects performance data for the instance that matches the specified filter criteria. For example, to display the instances that match a value of greater than 50 for the total\_ops counter, specify **-filter "total\_ops>50"**.

**[-sample-id <text>] - Sample Identifier**

Displays performance data for the specified sample. You collect a sample by using the statistics start and statistics stop commands.

**[-interval <integer>] - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**[-iterations <integer>] - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**[-sort-key <text>] - Counter Used For Sorting**

If this parameter is specified, the command displays statistics sorted by the specified counter. Only one counter can be specified.

**[-sort-order {ascending|descending}] - Sort Order**

This parameter may be used in conjunction with the **-sort-key** parameter. This parameter changes the order in which statistics are sorted. Possible values are **ascending** and **descending**. The default setting is **descending**.

**[-max <integer>] - Tracker Size**

Specifies the number of most active instances of an active object to display. The default setting is to display all of the instances.

## Examples

The following example starts collecting statistics and displays statistics for the sample named `smpl_1` for counters: `avg_processor_busy` and `cpu_busy`

```
cluster1::*> statistics start -object system -counter avg_processor_busy|cpu_busy
-sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1

cluster1::*> statistics show -sample-id smpl_1
Object: system
Instance: cluster
```

```
Start-time: 8/2/2012 18:27:53
End-time: 8/2/2012 18:27:56
Cluster: cluster1
```

Counter	Value
-----	-----
avg_processor_busy	6%
cpu_busy	6%

The following example starts and stops data collection and displays statistics for the sample named `smpl_1` for counters: `avg_processor_busy` and `cpu_busy`

```
cluster1::*> statistics start -object system -counter avg_processor_busy|cpu_busy
-sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1

cluster1::*> statistics stop -sample-id smpl_1
Statistics collection is being stopped for Sample-id: smpl_1

cluster1::*> statistics show -sample-id smpl_1
Object: system
Instance: cluster
Start-time: 8/2/2012 18:27:53
End-time: 8/2/2012 18:27:56
Cluster: cluster1
Counter
```

Counter	Value
-----	-----
avg_processor_busy	6%
cpu_busy	6%

- [statistics catalog object show](#)

## statistics start

Start data collection for a sample

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command starts the collection of performance data. Use the [statistics stop](#) command to stop

the collection. You view the sample of performance data by using the [statistics show](#) command. You can collect more than one sample at a time.

## Parameters

### **[-object <text>] - Object**

Selects the objects for which you want to collect performance data. This parameter is required. To view a list of valid object names, type [statistics catalog object show](#) at the command prompt. To specify multiple objects, use "|" between each object.

You should limit the scope of this command to only a few objects at a time to avoid a potentially significant impact on the performance of the system.

### **[-instance <text>] - Instance**

Selects the instances for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the instances associated with the specified objects. To specify multiple instances, use "|" between each instance.

For example, if you want to collect disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view. If you do not specify this parameter, the command will collect statistics for all disks in the system.

### **[-counter <text>] - Counter**

Selects the counters for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the counters in the specified objects. To specify multiple counters, use "|" between each counter.

### **[-preset <text>] - Preset**

If this parameter is specified, the command displays statistics for the specified preset.

### **[-sample-id <text>] - Sample Identifier**

Specifies an identifier for the sample. Identifiers must be unique and are restricted to the characters 0-9, a-z, A-Z, and "\_". If you do not specify this parameter, the command generates a sample identifier for you and defines this sample as the default sample for the CLI session. When you run the [statistics show](#) command without specifying the **-sample-id** parameter, data from the default sample displays. If you run this command during the same CLI session and do not specify the **-sample-id** parameter, the command overwrites the previous sample. The command does not delete the default sample when you close your session.

### **[-vserver <vserver name>] - Vserver**

Selects the vservers for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the Vservers in the cluster.

### **[-node {<nodename>|local}] - Node**

Selects the node for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the nodes in the cluster.

**[-filter <text>] - Filter**

Selects performance data for the instance that matches the specified filter criteria. For example, to display the instances from node1, specify **-filter "node\_name=node1"** .

**[-duration <integer>] - Sample Duration in Minutes**

If this parameter is specified, the command will collect the closing sample after the time specified. Duration can be specified in minutes.

**[-max <integer>] - Tracker Size**

Specifies the number of most active instances of an active object to display. The default setting is to display all of the instances.

**[-sort-key <text>] - Counter Used For Sorting**

If this parameter is specified, the command displays statistics sorted by the specified counter. Only one counter can be specified.

**[-sort-order {ascending|descending}] - Sort Order**

This parameter may be used in conjunction with the **-sort-key** parameter. This parameter changes the order in which statistics are sorted. Possible values are ascending and descending. The default setting is descending.

## Examples

The following example starts statistics collection for sample "smp1\_1":

```
cluster1::*> statistics start -object system -sample-id smp1_1
Statistics collection is being started for Sample-id: smp1_1
```

The following example starts collecting statistics for the sample named smp1\_1 for counters: avg\_processor\_busy and cpu\_busy

```
cluster1::*> statistics start -object system -counter avg_processor_busy|cpu_busy
-sample-id smp1_1
Statistics collection is being started for Sample-id: smp1_1
```

# statistics stop

Stop data collection for a sample

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command stops the collection of performance data. You view the sample of performance data by using the [statistics show](#) command.

## Parameters

**[-sample-id <text>] - Sample Identifier**

Specifies the identifier of the sample for which you want to stop data collection. If you do not specify this parameter, the command stops data collection for the last sample that you started by running the [statistics start](#) command without the **-sample-id** parameter.

## Examples

The following example stops data collection for sample "smp1\_1":

```
cluster1::*> statistics stop -sample-id smp1_1
Statistics collection is being stopped for Sample-id: smp1_1
```

# statistics aggregate show

Aggregate throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for aggregates at a regular interval. The command output displays data in the following columns:

- Aggregate - aggregate name.

- Node - node name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.

## Parameters

### **[-aggregate <text>] - Aggregate**

Selects the aggregate for which you want to display performance data.

### **[-node {<nodename>|local}] - Node**

Selects the node for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies maximum number of aggregates to display. The default setting is 25.

## Examples

The following example displays aggregate statistics:

```
cluster1::> statistics aggregate show
cluster-1 : 12/31/1969 16:00:04

      Aggregate          Node    *Total Read Write
      -----          -
aggr0_cluster_node2_0 cluster-node2      9    0    8
      aggr0 cluster-node1      6    0    5

[...]
```

## statistics cache flash-pool show

Flash pool throughput metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for flash pool caches at a regular interval. The command output displays data in the following columns:

- Aggregate - aggregate name.
- Vserver - vserver name.
- Volume - volume name.
- Read Hit - percent of IOs serviced from a cache level.
- Write Hit - percent of IOs serviced from a cache level.
- Cache Used - SSD cache blocks used.
- Read Blocks - read blocks.
- Write Blocks - write blocks.
- Rejects - cache rejects.

## Parameters

### **[-aggregate <text>] - Aggregate**

Selects the aggregate for which you want to display performance data.

### **[-vserver <vserver name>] - Vserver**

Selects the vserver for which you want to display performance data.

### **[-volume <text>] - Volume**

Selects the volume for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of flash pools to display. The default setting is 25.

## Examples

The following example displays flash pool statistics:

```
cluster1::> statistics cache flash-pool show
cluster1 : 12/31/2013 16:00:04
Read Write
      Hit  Hit      Cache  Read  Write
Aggregate  Vserver Volume (%)  (%)  Used  Blocks  Blocks  Rejects
-----
  agr1      - -total-    0    0     0     0     0     0
  agr2      vs1  vol1    0    0     0     0     0     0
[...]
```

## statistics catalog counter show

Display the list of counters in an object

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays the names and descriptions of counters. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

## Parameters

**[-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[[-describe ]]**

Displays detailed information about each counter, including privilege level, label, and whether the counter is a key counter.

**-object <text> - Object**

Selects the object for which you want to display the list of counters. This parameter is required. To view a list of valid object names, type `statistics catalog counter show-object`?'` or [statistics catalog object show](#).

**[-counter <text>] - Counter**

Selects the counters that match this parameter value. If you do not specify this parameter, the command displays details for all counters.

**[-filter <text>] - Filter Data**

Selects the counters that match this parameter value. For example, to display counters from node1, specify `-filter "node_name=node1"`.

**[-label <text>,...] - Labels for Array Counters**

Selects the counters that match this parameter value. A label is the name of the bucket to which an array counter belongs.

**[-description <text>] - Description**

Selects the counters that match this parameter value.

**[-privilege <text>] - Privileged Level**

Selects the counters that match this parameter value.

**[-is-key-counter {true|false}] - Is Key Counter**

Selects the counters that are key counters (true) or are not key counters (false). A key counter is a counter that uniquely identifies an instance across the cluster. The default setting is false. For example, "vserver\_name" and "node\_name" are key counters because they identify the specific Vserver or node to which the instance belongs.

**[-is-deprecated {true|false}] - Is Counter Deprecated**

Selects the counters that are deprecated (true) or are not deprecated (false).

**[-replaced-by <text>] - Replaced By Counter If Deprecated**

Selects all deprecated counters that are replaced by the counter provided to this parameter.

## Examples

The following example displays the list of counters in the processor object.

```
cluster1::> statistics catalog counter show -object processor
Object: processor
  Counter                Description
  -----
  instance_name          Instance Name
  instance_uuid          Instance UUID
  node_name               System node name
  node_uuid              System node id
  process_name           Ontap process that provided this instance
  processor_busy         Percentage of elapsed time that the processor
                        is executing non-idle processes
  processor_elapsed_time Wall-clock time since boot used for
                        calculating processor utilization
  sk_switches            Number of sk switches per second
8 entries were displayed.
```

# statistics catalog instance show

Display the list of instances associated with an object

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays the names of instances associated with the specified object. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

## Parameters

**[-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**-object <text> - Object**

Selects the object for which you want to display the list of instances. This parameter is required. To view a list of valid object names, type **statistics catalog instance show-object '?'** or [statistics catalog object show](#).

**[-instance <text>] - Instance Name**

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays all the instances.

**[-filter <text>] - Filter Data**

Selects the instances that match this parameter value. For example, to display instances from vserver1, specify **-filter "vserver\_name=vserver1"**.

**[-vserver <vserver name>,...]** - Vserver Name

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays instances for all of the Vservers in the cluster.

**[-node {<nodename>|local}] - Node Name**

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays instances for all of the nodes in the cluster.

## Examples

The following example displays the list of instances associated with the processor object.

```
cluster1::> statistics catalog instance show -object processor
Object: processor
  processor0
  processor0
  processor1
  processor1
4 entries were displayed.
```

- [statistics catalog object show](#)

# statistics catalog object show

Display the list of objects

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays the names and descriptions of objects from which you can obtain performance data. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

## Parameters

**[-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-describe ]}**

Displays detailed information about each object, including privilege level.

**[-object <text>] - Object**

Selects the objects for which you want to display information. If you do not specify this parameter, the command displays details for all of the objects.

**[-privilege <text>] - Privilege Level**

Selects the objects that match this parameter value.

**[-is-deprecated {true|false}] - Is Object Deprecated**

Selects the objects that are deprecated (true) or are not deprecated (false).

**[-replaced-by <text>] - Replaced By Object If Deprecated**

Selects all deprecated objects that are replaced by the object provided to this parameter.

**[-is-statistically-tracked {true|false}] - Is Object Statistically Tracked**

Specifies if the object is statistically tracked

**[-description <text>] - Description**

Selects the objects that match this parameter value.

## Examples

The following example displays descriptions of all objects in the cluster:

```
cluster1::> statistics catalog object show
  aggregate          CM object for exporting aggregate performance
                    counters
  audit_ng           CM object for exporting audit_ng performance
                    counters
  cifs               These counters report activity from both SMB
                    and SMB2 revisions of the CIFS protocol. For
                    information isolated to SMB, see the 'smb1'
                    object. For SMB2, see the 'smb2' object.
  cifs:node          These counters report activity from both SMB
                    and SMB2 revisions of the CIFS protocol. For
                    information isolated to SMB, see the 'smb1'
                    object. For SMB2, see the 'smb2' object.
  cifs:vserver       These counters report activity from both SMB
                    and SMB2 revisions of the CIFS protocol. For
                    information isolated to SMB, see the 'smb1'
                    object. For SMB2, see the 'smb2' object.
  cluster_peer       The cluster peer object contains peer
                    counters.

```

## statistics disk show

Disk throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command continuously displays performance data for disks at a regular interval. The command

output displays data in the following columns:

- Disk - disk name.
- Node - node name.
- Busy (%) - percentage of time there was at least one outstanding request to the disk.
- Total Ops - total operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.

## Parameters

### **[-disk <text>] - Disk**

Selects the disk for which you want to display performance data.

### **[-node {<nodename>|local}] - Node**

Selects the node for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of disks to display. The default setting is 25.

## Examples

The following example displays disk statistics:

```
cluster1::> statistics disk show
cluster1 : 12/31/1969 16:00:04
```

Disk	Node	Busy (%)	*Total Ops	Read Ops	Write Ops
VMw-1.31	node2	0	2	2	0
VMw-1.30	node2	0	3	0	3
VMw-1.3	node1	0	0	0	0
VMw-1.29	node2	0	1	0	1

[...]

# statistics lif show

Logical network interface throughput and latency metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for LIFs at a regular interval. The command output displays data in the following columns:

- LIF - logical interface name.
- Vserver - vserver name.
- Recv Packet - packets received per second.
- Recv Data (Bps) - bytes received per second.
- Recv Errors - receive errors per second.
- Sent Packet - packets sent per second.
- Sent Data (Bps) - bytes sent per second.
- Sent Errors - transfer errors per second.
- Current Port - current use port.

## Parameters

### **[-lif <text>] - LIF**

Selects the LIF for which you want to display performance data.

### **[-vserver <vserver name>] - Vserver**

Selects the vserver for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**-max <integer> - Maximum Number of Instances**

Specifies the maximum number of LIFs to display. The default setting is 25.

## Examples

The following example displays LIFs statistics:

```
cluster1::> statistics lif show
cluster1 : 12/31/1969 16:00:04
```

LIF	Vserver	Recv			Sent			Current Port
		Packet	Data (Bps)	Errors	Packet	Data (Bps)	Errors	
node2_clus_1	Cluster	3	536	0	3	338	0	e0a
node2_clus_2	Cluster	3	398	0	3	287	0	e0b
node1_clus_2	Cluster	3	338	0	3	536	0	e0b
node1_clus_1	Cluster	3	287	0	3	398	0	e0a
node2_mgmt1	ncluster-1	0	0	0	0	0	0	e0c

[...]

## statistics lun show

LUN throughput and latency metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for LUNs at a regular interval. The command output displays data in the following columns:

- Lun - LUN name.
- Vserver - vserver name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

## Parameters

### **[-lun <text>] - Lun**

Selects the LUN for which you want to display performance data.

### **[-vserver <vserver name>] - Vserver**

Selects the vservers for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of LUNs to display. The default setting is 25.

## Examples

The following example displays LUN statistics:

```
cluster1::> statistics lun show
cluster1 : 12/31/2013 16:00:04
*Total Read Write Other   Read Write Latency
  Lun Vserver      Ops  Ops   Ops   Ops (Bps) (Bps)   (us)
-----
lun1   vs1       58  13   15   29 310585  3014   39
lun0   vs2       56   0   11   45  8192 28826   47
[...]
```

## statistics namespace show

Namespace throughput and latency metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for Namespaces at a regular interval. The command output displays data in the following columns:

- Namespace - Namespace name.
- Vserver - vserver name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(ms) - average latency for an operation in milliseconds.

## Parameters

### **[-namespace <text>] - Namespace**

Selects the Namespace for which you want to display performance data.

### **[-vserver <vserver name>] - Vserver**

Selects the vserver for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of Namespaces to display. The default setting is 25.

## Examples

The following example displays Namespace statistics:

```
cluster1::> statistics namespace show
cluster1 : 12/31/2017 16:00:04
*Total Read Write Other   Read Write Latency
  Namespace Vserver    Ops  Ops   Ops   Ops (Bps) (Bps)   (ms)
-----
ns1          vs1     58  13   15   29 310585  3014    39
ns0          vs2     56   0   11   45  8192 28826    47
[...]
```

# statistics nfs show-mount

Display mount statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **statistics nfs show-mount** command displays the following statistics about the NFS mounts on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of mount operations
- Total number of dump operations
- Total number of unmount operations
- Total number of unmountall operations
- Total number of export operations
- Total number of exportall operations
- Total number of pathconf operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use 'fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-mount <Counter with Delta>] - Mount Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mount operations.

**[-dump <Counter with Delta>] - Dump Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of dump operations.

**[-unmnt <Counter with Delta>] - UnMount Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmount operations.

**[-unmntall <Counter with Delta>] - UnMountAll Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmountall operations.

**[-export <Counter with Delta>] - Export Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of export operations.

**[-exportall <Counter with Delta>] - ExportAll Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of exportall operations.

**[-pathconf <Counter with Delta>] - PathConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the NFS mounts for a node named node1:

```
cluster1::*> statistics nfs show-mount -node node1

Node          Value      Delta
node1        -----success-----
Null Ops:           2      0/s:16s
Mount Ops:          1      0/s:16s
Dump Ops:           0           -
```

```

Unmount Ops:          1      0/s:16s
Unmount All Ops:      0      -
Export Ops:           0      -
ExportAll Ops         0      -
PathConf Ops:        0      -
Total Ops:            4      0/s:16s

```

```

Node          Value      Delta
node1        -----failure-----
Null Ops:    0          -
Mount Ops:   0          -
Dump Ops:    0          -
Unmount Ops: 0          -
Unmount All Ops: 0      -
Export Ops:  0          -
ExportAll Ops 0          -
PathConf Ops: 0          -
Total Ops:   0          -

```

## statistics nfs show-nlm

(DEPRECATED)-Display NLM statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **statistics nfs show-nlm** command displays the following statistics about the Network Lock Manager (NLM) on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of test operations
- Total number of lock operations
- Total number of cancel operations
- Total number of unlock operations
- Total number of granted operations
- Total number of share operations
- Total number of unshare operations
- Total number of nmlock operations
- Total number of freeall operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

This command requires an effective cluster version earlier than Data ONTAP 9.0. Data for nodes running Data ONTAP 9.0 or later is not collected, and will not be displayed. Use the `statistics show`-object`nlm` command instead.

## Parameters

### `{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### `[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### `[-node {<nodename>|local}] - Node`

If you specify this parameter, the command displays statistics only for the specified node.

### `[-result {success|failure|all}] - Result`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

### `[-null <Counter with Delta>] - Null Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

### `[-test <Counter with Delta>] - Test Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of test operations.

### `[-lock <Counter with Delta>] - Lock Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

### `[-cancel <Counter with Delta>] - Cancel Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of cancel operations.

### `[-unlock <Counter with Delta>] - Unlock Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unlock operations.

### `[-granted <Counter with Delta>] - Granted Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of granted operations.

**[-share <Counter with Delta>] - Share Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of share operations.

**[-unshare <Counter with Delta>] - Unshare Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unshare operations.

**[-nmlock <Counter with Delta>] - NmLock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nmlock operations.

**[-freeall <Counter with Delta>] - FreeAll Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of freeall operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the NLM for a node named node1:

```
cluster1::*> statistics nfs show-nlm -node node1
```

Node	Value	Delta
node1	-----success-----	
Null:	0	-
Test:	0	-
Lock:	2	0/s:23s
Cancel:	0	-
Unlock:	1	0/s:23s
Granted:	0	-
Share:	0	-
Unshare:	0	-
NmLock:	0	-
FreeAll:	0	-
Total:	3	0/s:23s

Node	Value	Delta
node1	-----failure-----	
Null:	0	-
Test:	0	-
Lock:	0	-
Cancel:	0	-
Unlock:	0	-
Granted:	0	-

Share:	0	-
Unshare:	0	-
NmLock:	0	-
FreeAll:	0	-
Total:	0	-

- [statistics show](#)

# statistics nfs show-statusmon

Display status monitor statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **statistics nfs show-statusmon** command displays the following statistics about the Status Monitor on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of stat operations
- Total number of monitor operations
- Total number of unmonitor operations
- Total number of unmonitor all operations
- Total number of simucrash operations
- Total number of notify operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ [-instance ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-stat <Counter with Delta>] - Stat Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of stat operations.

**[-monitor <Counter with Delta>] - Monitor Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of monitor operations.

**[-unmonitor <Counter with Delta>] - Unmonitor Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor operations.

**[-unmonall <Counter with Delta>] - Unmonitor All Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor all operations.

**[-simucrash <Counter with Delta>] - SimuCrash Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of simucrash operations.

**[-notify <Counter with Delta>] - Notify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of notify operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the status monitor for a node named node1:

```
cluster1::*> statistics nfs show-statusmon -node node1
```

Node	Value	Delta
node1	-----success-----	

```

Null Ops:           0           -

## statistics nfs show-v3

Display NFSv3 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **statistics nfs show-v3** command displays the following statistics about the NFSv3 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of getattr operations
- Total number of setattr operations
- Total number of lookup operations
- Total number of access operations
- Total number of readsymlink operations
- Total number of read operations
- Total number of write operations
- Total number of create operations
- Total number of mkdir operations
- Total number of symlink operations

- Total number of mknod operations
- Total number of remove operations
- Total number of rmdir operations
- Total number of rename operations
- Total number of link operations
- Total number of readdir operations
- Total number of readdirplus operations
- Total number of fsstat operations
- Total number of fsinfo operations
- Total number of pathconf operations
- Total number of commit operations
- Total number of nfsv3 operations
- Percent of null operations
- Percent of getattr operations
- Percent of setattr operations
- Percent of lookup operations
- Percent of access operations
- Percent of readsymlink operations
- Percent of read operations
- Percent of write operations
- Percent of create operations
- Percent of mkdir operations
- Percent of symlink operations
- Percent of mknod operations
- Percent of remove operations
- Percent of rmdir operations
- Percent of rename operations
- Percent of link operations
- Percent of readdir operations
- Percent of readdirplus operations
- Percent of fsstat operations
- Percent of fsinfo operations
- Percent of pathconf operations
- Percent of commit operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

### { [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### [ [-instance ] ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### [ -node {<nodename>|local} ] - Node

If you specify this parameter, the command displays NFSv3 statistics only for the specified node.

### [ -result {success|failure|all} ] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

### [ -null <Counter with Delta> ] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

### [ -gattr <Counter with Delta> ] - GetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

### [ -setattr <Counter with Delta> ] - SetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

### [ -lookup <Counter with Delta> ] - LookUp Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

### [ -access <Counter with Delta> ] - Access Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

### [ -rsym <Counter with Delta> ] - ReadSymlink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readsymlink operations.

### [ -read <Counter with Delta> ] - Read Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

**[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

**[-mkdir <Counter with Delta>] - Mkdir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mkdir operations.

**[-symlink <Counter with Delta>] - SymLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of symlink operations.

**[-mknod <Counter with Delta>] - Mknod Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mknod operations.

**[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

**[-rmdir <Counter with Delta>] - Rmdir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rmdir operations.

**[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

**[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

**[-rmdir <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

**[-rdirp <Counter with Delta>] - ReadDirPlus Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdirplus operations.

**[-fsstat <Counter with Delta>] - FsStat Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsstat operations.

**[-fsinfo <Counter with Delta>] - FsInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsinfo operations.

**[-pconf <Counter with Delta>] - PathConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

**[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total NFSv3 operations.

**[-null-pct <Counter with Delta>] - Percent Null Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-setattr-pct <Counter with Delta>] - Percent SetAttr Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-lookup-pct <Counter with Delta>] - Percent LookUp Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-access-pct <Counter with Delta>] - Percent Access Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-rsym-pct <Counter with Delta>] - Percent ReadSymlink Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readsymlink operations.

**[-read-pct <Counter with Delta>] - Percent Read Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

**[-write-pct <Counter with Delta>] - Percent Write Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

**[-create-pct <Counter with Delta>] - Percent Create Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-mkdir-pct <Counter with Delta>] - Percent Mkdir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mkdir operations.

**[-symlink-pct <Counter with Delta>] - Percent Symlink Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of symlink operations.

**[-mknod-pct <Counter with Delta>] - Percent Mknod Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mknod operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rmdir-pct <Counter with Delta>] - Percent Rmdir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rmdir operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-link-pct <Counter with Delta>] - Percent Link Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-rdir-pct <Counter with Delta>] - Percent ReadDir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

**[-rdirp-pct <Counter with Delta>] - Percent ReadDirPlus Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdirplus operations.

**[-fsstat-pct <Counter with Delta>] - Percent FsStat Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsstat operations.

**[-fsinfo-pct <Counter with Delta>] - Percent FsInfo Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsinfo operations.

**[-pconf-pct <Counter with Delta>] - Percent PathConf Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of pathconf operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

## Examples

The following example displays statistics about the NFSv3 operations for a node named node1:

```
cluster1::> statistics nfs show-v3 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1	-----success-----			
Null Ops:	4	-	7%	-
GetAttr Ops:	10	-	19%	-
SetAttr Ops:	2	-	4%	-
Lookup Ops:	2	-	4%	-
Access Ops:	14	-	26%	-
ReadSymLink Ops:	0	-	0%	-
Read Ops:	0	-	0%	-
Write Ops:	0	-	0%	-
Create Ops:	2	-	4%	-
MkDir Ops:	1	-	2%	-
SymLink Ops:	0	-	0%	-
MkNod Ops:	0	-	0%	-
Remove Ops:	1	-	2%	-
RmDir Ops:	0	-	0%	-
Rename Ops:	0	-	0%	-
Link Ops:	0	-	0%	-
ReadDir Ops:	2	-	4%	-
ReadDirPlus Ops:	10	-	19%	-
FsStat Ops:	1	-	2%	-
FsInfo Ops:	5	-	9%	-
PathConf Ops:	0	-	0%	-
Commit Ops:	0	-	0%	-
Total Ops:	54	-		

Node	Value	Delta	Percent Ops	Delta
node1	-----failure-----			
Null Ops:	0	-	0%	-
GetAttr Ops:	0	-	0%	-
SetAttr Ops:	0	-	0%	-
Lookup Ops:	2	-	100%	-

## statistics nfs show-v4

Display NFSv4 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **statistics nfs show-v4** command displays the following statistics about the NFSv4 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations
- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations

- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rlockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of getattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations
- Percent of nverify operations
- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations
- Percent of putpubfh operations
- Percent of putrootfh operations

- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations
- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

### { [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### [ [-instance ] ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### [ -node {<nodename>|local} ] - Node

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

### [ -result {success|failure|all} ] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

### [ -null <Counter with Delta> ] - Null Procedure

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

### [ -cmpnd <Counter with Delta> ] - Compound Procedure

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified number of compound operations.

**[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

**[-close <Counter with Delta>] - Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

**[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

**[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

**[-delepur <Counter with Delta>] - Delepurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delepurge operations.

**[-delrtn <Counter with Delta>] - Deleget Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of deleget operations.

**[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

**[-getfh <Counter with Delta>] - GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

**[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

**[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

**[-lockt <Counter with Delta>] - LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

**[-locku <Counter with Delta>] - LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that

---

have the specified number of locku operations.

**[-lookup <Counter with Delta>] - Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

**[-lookpp <Counter with Delta>] - LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

**[-nverify <Counter with Delta>] - Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

**[-open <Counter with Delta>] - Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

**[-opatrr <Counter with Delta>] - OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

**[-opconf <Counter with Delta>] - OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

**[-opndg <Counter with Delta>] - OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

**[-putfh <Counter with Delta>] - PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

**[-putpfb <Counter with Delta>] - PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfb operations.

**[-putrfh <Counter with Delta>] - PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfb operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-readdr <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified number of readdir operations.

#### **[-rlink <Counter with Delta>] - ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

#### **[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

#### **[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

#### **[-renew <Counter with Delta>] - Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

#### **[-restfh <Counter with Delta>] - RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

#### **[-savefh <Counter with Delta>] - SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

#### **[-secinf <Counter with Delta>] - SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

#### **[-setattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

#### **[-sclid <Counter with Delta>] - SetCliid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

#### **[-scidc <Counter with Delta>] - SetCliidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

#### **[-verify <Counter with Delta>] - Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

#### **[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified number of write operations.

**[-relown <Counter with Delta>] - RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total nfsv4 operations.

**[-null-pct <Counter with Delta>] - Percent Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

**[-access-pct <Counter with Delta>] - Percent Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-close-pct <Counter with Delta>] - Percent Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**[-create-pct <Counter with Delta>] - Percent Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-delpur-pct <Counter with Delta>] - Percent Delempurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delempurge operations.

**[-delrtn-pct <Counter with Delta>] - Percent Delempret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delempret operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-getfh-pct <Counter with Delta>] - Percent GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified percentage of getfh operations.

#### **[-link-pct <Counter with Delta>] - Percent Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

#### **[-lock-pct <Counter with Delta>] - Percent Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

#### **[-lockt-pct <Counter with Delta>] - Percent LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

#### **[-locku-pct <Counter with Delta>] - Percent LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

#### **[-lookup-pct <Counter with Delta>] - Percent Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

#### **[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

#### **[-nverify-pct <Counter with Delta>] - Percent Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

#### **[-open-pct <Counter with Delta>] - Percent Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

#### **[-opattr-pct <Counter with Delta>] - Percent OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opattr operations.

#### **[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

#### **[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

#### **[-putfh-pct <Counter with Delta>] - Percent PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified percentage of putfh operations.

**[-putpvh-pct <Counter with Delta>] - Percent PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

**[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

**[-read-pct <Counter with Delta>] - Percent Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

**[-readdir-pct <Counter with Delta>] - Percent ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

**[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-renew-pct <Counter with Delta>] - Percent Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

**[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

**[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

**[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

**[-setattr-pct <Counter with Delta>] - Percent SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified percentage of setattr operations.

### **[-sclid-pct <Counter with Delta>] - Percent SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setcliid operations.

### **[-scidc-pct <Counter with Delta>] - Percent SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setcliidconf operations.

### **[-verify-pct <Counter with Delta>] - Percent Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

### **[-write-pct <Counter with Delta>] - Percent Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

### **[-relown-pct <Counter with Delta>] - Percent RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rellockown operations.

## Examples

The following example displays statistics about the NFSv4 operations for a node named node1:

```
cluster1::> statistics nfs show-v4 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1	-----success-----			
Null Procs:	2	-	1%	-
Cmpnd Procs:	92	-		-
Access Ops:	16	-	6%	-
Close Ops:	8	-	3%	-
Commit Ops:	0	-	0%	-
Create Ops:	0	-	0%	-
Delpur Ops:	0	-	0%	-
Delrtn Ops:	0	-	0%	-

## statistics nfs show-v41

Display NFSv4.1 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **statistics nfs show-v41** command displays the following statistics about the NFSv4.1 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations

- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations
- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rellockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of setattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations

- Percent of lookupp operations
- Percent of nverify operations
- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations
- Percent of putpubfh operations
- Percent of putrootfh operations
- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations
- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays NFSv4.1 statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-cmpnd <Counter with Delta>] - Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

**[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

**[-close <Counter with Delta>] - Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

**[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

**[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

**[-delepur <Counter with Delta>] - Delepur Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delepur operations.

**[-deletrn <Counter with Delta>] - Deletrn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of deletrn operations.

**[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of gattr operations.

**[-getfh <Counter with Delta>] - GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

**[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

**[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

**[-lockt <Counter with Delta>] - LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

**[-locku <Counter with Delta>] - LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

**[-lookup <Counter with Delta>] - Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

**[-lookpp <Counter with Delta>] - LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

**[-nverify <Counter with Delta>] - Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

**[-open <Counter with Delta>] - Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

**[-opattr <Counter with Delta>] - OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

**[-opconf <Counter with Delta>] - OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

**[-opndg <Counter with Delta>] - OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

**[-putfh <Counter with Delta>] - PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

**[-putpvh <Counter with Delta>] - PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

**[-putrfh <Counter with Delta>] - PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-readdir <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

**[-rlink <Counter with Delta>] - ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

**[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

**[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

**[-renew <Counter with Delta>] - Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

**[-restfh <Counter with Delta>] - RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

**[-savefh <Counter with Delta>] - SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

**[-secinf <Counter with Delta>] - SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

**[-setattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

**[-sclid <Counter with Delta>] - SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

**[-scidc <Counter with Delta>] - SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

**[-verify <Counter with Delta>] - Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

**[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

**[-relown <Counter with Delta>] - RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total nfsv4.1 operations.

**[-null-pct <Counter with Delta>] - Percent Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

**[-access-pct <Counter with Delta>] - Percent Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-close-pct <Counter with Delta>] - Percent Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**[-create-pct <Counter with Delta>] - Percent Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-deipur-pct <Counter with Delta>] - Percent Delepurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegpurge operations.

**[-delrtn-pct <Counter with Delta>] - Percent Deleget Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegret operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-getfh-pct <Counter with Delta>] - Percent GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

**[-link-pct <Counter with Delta>] - Percent Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-lock-pct <Counter with Delta>] - Percent Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

**[-lockt-pct <Counter with Delta>] - Percent LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

**[-locku-pct <Counter with Delta>] - Percent LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

**[-lookup-pct <Counter with Delta>] - Percent Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

**[-nverify-pct <Counter with Delta>] - Percent Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

**[-open-pct <Counter with Delta>] - Percent Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

**[-opatrr-pct <Counter with Delta>] - Percent OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

**[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

**[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

**[-putfh-pct <Counter with Delta>] - Percent PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

**[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

**[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

**[-read-pct <Counter with Delta>] - Percent Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

**[-readdr-pct <Counter with Delta>] - Percent ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdr operations.

**[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-renew-pct <Counter with Delta>] - Percent Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

**[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

**[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

**[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

**[-sattr-pct <Counter with Delta>] - Percent SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-sclid-pct <Counter with Delta>] - Percent SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclid operations.

**[-scidc-pct <Counter with Delta>] - Percent SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclidconf operations.

**[-verify-pct <Counter with Delta>] - Percent Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

**[-write-pct <Counter with Delta>] - Percent Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

**[-relown-pct <Counter with Delta>] - Percent RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rellockown operations.

## Examples

The following example displays statistics about the NFSv4.1 operations for a node named node1:

```
cluster1::> statistics nfs show-v41 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1	-----success-----			
Null Procs:	2	-	1%	-
Cmpnd Procs:	92	-		-
Access Ops:	16	-	6%	-

## statistics node show

System utilization metrics for each node in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for nodes at a regular interval. The command output displays data in the following columns:

- Node - node name.
- CPU (%) - CPU utilization.
- Total Ops - total number of operations per second.
- Latency(ms) - average latency for an operation in milliseconds.

## Parameters

**[-node {<nodename>|local}] - Node**

Selects the node for which you want to display performance data.

**[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

**-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**-max <integer> - Maximum Number of Instances**

Specifies the maximum number of aggregates to display. The default setting is 25.

## Examples

The following example displays node statistics:

```
cluster1::> statistics node show
cluster1 : 12/31/2013 16:00:04

      CPU *Total Latency
Node (%)  Ops    (ms)
-----
node2  76    113     -
node1  58     10     -

[...]
```

## statistics oncrpc show-rpc-calls

Display ONC RPC Call Statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command is deprecated and will be removed in a future major release.

The **statistics oncrpc show-rpc-calls** command displays information about the Open Network Computing Remote Procedure Call (ONC RPC) calls performed by the nodes of a cluster.

## Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{ [-instance ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display information only about the RPC calls performed by the node you specify.

**[-protocol {TCP|UDP|RDMA}] - Transport Protocol**

Use this parameter to display information only about the RPC calls performed using the network protocol you specify.

**[-badproc <Counter with Delta>] - Bad Procedure Calls**

Use this parameter to display information only about the RPC calls that have the number of bad procedure calls you specify. Bad procedure calls are RPC requests that contain invalid procedure numbers and cannot be completed.

**[-badlen <Counter with Delta>] - Bad Length Calls**

Use this parameter to display information only about the RPC calls that have the number of bad length calls you specify.

**[-badhdr <Counter with Delta>] - Bad Header Calls**

Use this parameter to display information only about the RPC calls that have the number of bad header calls you specify.

**[-badcalls <Counter with Delta>] - Bad Calls**

Use this parameter to display information only about the RPC calls that have the number of bad calls you specify.

**[-badprogcalls <Counter with Delta>] - Bad Program Calls**

Use this parameter to display information only about the RPC calls that have the number of bad program calls you specify.

**[-calls <Counter64 with Delta>] - Total Calls**

Use this parameter to display information only about the RPC calls that have the total number of bad calls you specify.

## Examples

```
cluster1::> statistics oncrpc show-rpc-calls
```

Node	Value	Delta
node1	-----tcp-----	
Bad Proc:	0	-
Bad Len:	0	-
Bad Hdr:	0	-
Bad Calls:	0	-
Bad Prog Calls:	0	-
Total Calls:	0	-

Node	Value	Delta
------	-------	-------

```

node1      -----udp-----
Bad Proc:      0      -
Bad Len:       0      -
Bad Hdr:       0      -
Bad Calls:     0      -
Bad Prog Calls: 0      -
Total Calls:   0      -

Node          Value          Delta
node2      -----tcp-----
Bad Proc:      0      -
Bad Len:       0      -
Bad Hdr:       0      -
Bad Calls:     0      -
Bad Prog Calls: 0      -
Total Calls:   0      -

Node          Value          Delta
node2      -----udp-----
Bad Proc:      0      -
Bad Len:       0      -
Bad Hdr:       0      -
Bad Calls:     0      -
Bad Prog Calls: 0      -
Total Calls:   0      -
4 entries were displayed.

```

## statistics port fcp show

FCP port interface throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command continuously displays performance data for FCP ports at a regular interval. The command output displays data in the following columns:

- Port - port name.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.

### Parameters

**[-port <text>] - Port**

Selects the port for which you want to display performance data.

**[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

**-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**-max <integer> - Maximum Number of Instances**

Specifies the maximum number of ports to display. The default setting is 25.

## Examples

The following example displays port statistics:

```
cluster1::> statistics port fcp show
cluster1 : 12/31/2013 16:00:04

      *Total Read Write
Port   Ops  Ops  Ops
-----
port1   2   2   0
port2   3   0   3

[...]
```

## statistics preset delete

Delete an existing Performance Preset

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

Deletes a performance preset configuration and all of its associated details.

### Parameters

**-preset <text> - Preset Name**

Specifies the name of the performance presets that you want to delete.

## Examples

```
cluster1::*> statistics preset show
  Preset Name: asup-event
  Preset UUID: 55c03699-01db-11e2-8e3e-123478563412
    Comment: The event-based AutoSupport Data ONTAP Performance Archive
             preset configuration. This preset configuration is used
             whenever an event-based AutoSupport is triggered.

# statistics preset modify

Modify an existing Performance Preset

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

Modifies an existing performance preset configuration. The command modifies the global properties of a preset, but does not modify the details of the preset, such as specific objects and counters sampled.

## Parameters

### **-preset <text> - Preset Name**

Name of the performance preset to be modified.

### **[-new-name <text>] - New Preset Name**

Set preset name to the given new name.

### **[-comment <text>] - Preset Description**

Set comment to the given value.

### **[-privilege <PrivilegeLevel>] - Preset Privilege Level**

Set privilege level at which this preset can be viewed or modified to the given value. Possible values: admin, advanced, diagnostic.

## Examples

```
cluster1:*> statistics preset show
  Preset Name: delta
  Preset UUID: 7a04f19d-02a7-11e2-8e40-123478563412
    Comment: custom preset description
  Privilege: diagnostic
  Read-Only: false
  Archive Enabled: false
  Generation ID: 0

1 entry was displayed.

cluster1:*> statistics preset modify -preset delta -comment "new comment"

cluster1:*> statistics preset show
  Preset Name: delta
  Preset UUID: 7a04f19d-02a7-11e2-8e40-123478563412
    Comment: new comment
```

```

Privilege: diagnostic
Read-Only: false
Archive Enabled: false
Generation ID: 0

```

1 entry was displayed.

## statistics preset show

Display information about Performance Presets

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

Displays information about performance preset configurations.

### Parameters

**{ [-fields <fieldname>, ... ] }**

Selects which performance preset attributes to display.

**[ -instance ] }**

Shows details of all attributes of performance preset configuration.

**[ -preset <text> ] - Preset Name**

Selects the performance presets that match the specified preset name.

**[ -comment <text> ] - Preset Description**

Selects the performance presets that match the specified comment.

**[ -privilege <PrivilegeLevel> ] - Preset Privilege Level**

Selects the performance presets that are available with the specified privilege.

**[ -is-read-only {true|false} ] - Is Preset Read-Only?**

Selects the performance presets that are read-only (true) or are not read-only (false). Read-only presets cannot be modified.

**[ -store <text> ] - Name of Store Where Data is Saved**

Selects the store where data is saved.

### Examples

```

cluster1::*> statistics preset show
Preset Name      Privilege  Read-Only  Comment

```

```

-----
aggregate_overview  admin      true      This preset configuration is used by
                  statistics aggregate show command.
                  Provides overview of aggregate object.
disk_overview       advanced  true      This preset configuration is used by
                  statistics disk show command.
                  Provides overview of disk object.
fcp_port_overview   admin     true      This preset configuration is used by
                  statistics port fcp show command.
                  Provides overview of fcp port object.
flash_pool_overview admin     true      This preset configuration is used by
                  statistics cache flash-pool show
                  command. Provides overview of flash
                  pool object.

[...]

```

## statistics preset detail show

Display information about Performance Preset Details

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

Displays the specific details of each preset, including the objects sampled, the counter sample periods, and the counters sampled.

### Parameters

**{ [-fields <fieldname>, ... ] }**

Selects which performance preset detail attributes to display.

**{ [-instance ] }**

Displays all of the performance preset detail attributes.

**[-preset <text>] - Preset Name**

Selects the performance preset details that match the specified preset name.

**[-object <text>] - Performance Object**

Selects the performance preset details that match the specified object name.

**[-sample-period <sample\_per\_iod>] - Archive Sample period**

Selects the performance preset details that are collected at the specified sample period.

**[-counter-set <text>, ... ] - Performance Counter Name Set**

Selects the performance preset details that match the specified counters in the counter set. Use

"|" to separate multiple counters.

### **[-instance-filters <text>,...] - Performance Instance Filters**

Selects the performance preset details that match the specified instance filters. Use "|" to separate multiple instance filters. This field is reserved for future use.

## Examples

```
cluster1::*> statistics preset detail show
Preset Name Object      Sample Counter      Instance
                Period Set      Filters
-----
asup-event  aggregate  1w  instance_name, -
                node_name,

## statistics qtree show

Qtree I/O operation rates

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for qtrees at a regular interval. The command output displays data in the following columns:

- Qtree - Qtree name.
- Vserver - Vserver name.
- Volume - Volume name.
- NFS Ops - NFS operations per second.
- CIFS Ops - CIFS operations per second.
- Internal Ops - Internal operations per second.
- Total Ops - Total number of operations per second.

## Parameters

### **[-qtree <text>] - Qtree**

Selects the qtree for which you want to display performance data. The qtree name has to be given in the format "vol\_name/qtree\_name"

### **[-vserver <vserver name>] - Vserver**

Selects the Vserver for which you want to display performance data.

### **[-volume <text>] - Volume**

Selects the volume for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of qtrees to display. The default setting is 25.

## Examples

The following example displays qtree statistics:

```
C1_sti20-vsimgucs429g_1520278254::> statistics qtree show
C1_sti20-vsimgucs429g_1520278254 : 3/14/2018 15:40:46
NFS CIFS Internal *Total
      Qtree Vserver  Volume ops  ops      ops  ops
-----
flexvol/qt1    vs0 flexvol   7    0      0    7
dp_vol/qt9     vs0 dp_vol    7    0      0    7
dp_vol/qt8     vs0 dp_vol    7    0      0    7
```

[...]

# statistics samples delete

Delete statistics samples

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command deletes samples that you created using the [statistics start](#) command.

## Parameters

**-vserver <vserver name> - Vserver**

Selects the Vserver for which you want to delete the sample. The default Vserver is admin Vserver.

**-sample-id <text> - Sample Identifier**

Specifies the sample that you want to delete. This is a required parameter.

## Examples

The following example deletes the sample "smpL\_1":

```
cluster1::*> statistics samples delete -sample-id smpL_1
```

- [statistics start](#)

# statistics samples show

Display statistics samples

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays information about the samples that you created using the [statistics start](#) command.

## Parameters

### `[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### `[-describe ]}`

Displays detailed information about each sample.

### `[-vserver <vserver name>] - Vserver`

Selects the samples that match this parameter value. If you omit this parameter, the command displays details for all samples.

### `[-sample-id <text>] - Sample Identifier`

Selects the samples that match this parameter value. If you do not specify this parameter, the command will display information about all the samples in the cluster.

## Examples

The following example displays information for sample "smp1\_1":

```
cluster1::*> statistics samples show -sample-id smp1_1
Vserver          Sample ID          Start Time          Stop Time          Status
-----
cluster-d1      smp1_1            09/13 18:06:46    -                  Ready
```

The following example displays detailed information for sample "smp1\_1":

```
cluster1::*> statistics samples show -sample-id smp1_1 -describe
Vserver: vs1
Sample ID: smp1_1
Object: processor
Instance: -
Counter: -
Start Time: 09/13 18:06:46
Stop Time: -
Status: Ready    - -
Privilege: admin
```

# statistics settings modify

Modify settings for the statistics commands

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command modifies the settings for all of the **statistics** commands.

## Parameters

### **[-display-rates {true|false}] - Display Rates**

Specifies whether the **statistics** commands display rate counters in rates/second. The default is true.

### **[-client-stats {enabled|disabled}] - Collect Per-Client Statistics**

Specifies whether **statistics** commands display per-client information. The default is disabled.

If you enable this setting, you might significantly impact system performance.

### **[-counter-display-units {B|KB|MB|GB}] - Counter Display Units**

Specifies display units for the counters. The default setting is MB.

### **[-display-count-exponent <integer>] - Display Count Exponent**

Specifies display exponent value for the counters representing counts. The default setting is 3 (thousand).

## Examples

The following example sets the value of the **-display-rates** parameter to false :

```
cluster1::*> statistics settings modify -display-rates false
```

# statistics settings show

Display settings for the statistics commands

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command displays the current settings for all of the **statistics** commands.

## Examples

The following example displays the current settings for all **statistics** commands:

```
cluster1::*> statistics settings show
Display rate Counters in rate/sec: true

Counter Display: full
Counter Display Units: MB
Display Count Exponent: 3
```

## statistics system show

System utilization metrics for the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for cluster at a regular interval. The command output displays data in the following columns:

- System - cluster name.
- CPU (%) - CPU utilization.
- Total Ops - total number of operations per second.
- Latency(ms) - average latency for an operation in milliseconds.

## Parameters

### **[-system <text>] - System**

Selects the cluster for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of systems to display. The default setting is 25.

## Examples

The following example displays system statistics:

```
cluster1::> statistics system show
cluster1 : 12/31/2013 16:00:04

      CPU *Total Latency
System (%)  Ops   (ms)
-----
Cluster  76   113   -

[...]
```

## statistics top client show

Most active NFS and CIFS clients

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for the top NFS and CIFS clients at a regular interval. The command output displays data in the following columns:

- Client - client name.
- Vserver - vserver name.
- Node - node name.
- Total Ops - total number of operations per second.
- Total (Bps) - total throughput in bytes per second.

## Parameters

**[-node {<nodename>|local}] - Node**

Selects the node for which you want to display performance data.

**[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

**-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1.

If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies maximum number of top clients to display. The default setting is 10.

## Examples

The following example displays top client statistics:

```
cluster1::> statistics top client show
cluster-1 : 12/31/1969 16:00:04
*Total Total
      Client  Vserver      Node  Ops (Bps)
-----
 172.17.236.53:938 vserver01 cluster-node2    9    80
 172.17.236.160:898 vserver02 cluster-node1    6    50
[...]

```

## statistics top file show

Most actively accessed files

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for top files at a regular interval. The command output displays data in the following columns:

- File - file name.
- Volume - volume name.
- Vserver - vserver name.
- Aggregate - aggregate name.
- Node - node name.
- Total Ops - total number of operations per second.
- Total (Bps) - total throughput in bytes per second.

## Parameters

### **[-node {<nodename>|local}] - Node**

Selects the node for which you want to display performance data.

**[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

**-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**-max <integer> - Maximum Number of Instances**

Specifies maximum number of top files to display. The default setting is 10.

## Examples

The following example displays top files statistics:

```
cluster1::> statistics top file show
cluster-1: 12/31/1969 16:00:04
```

File	Volume	Vserver	Aggregate	Node	*Total Ops	Total (Bps)
/vol/vol01/clus/cache	vol01	vserver01	aggr1	cluster-node2	9	80
/vol/vol02	vol02	vserver02	aggr2	cluster-node1	6	50

[...]

## statistics volume show

Volume throughput and latency metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for volumes at a regular interval. The command output displays data in the following columns:

- Volume - volume name.
- Vserver - vserver name.
- Aggregate - aggregate name.
- Total Ops - total number of operations per second.

- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

## Parameters

### **[-volume <text>] - Volume**

Selects the volume for which you want to display performance data.

### **[-vserver <vserver name>] - Vserver**

Selects the vserver for which you want to display performance data.

### **[-aggregate <text>] - Aggregate**

Selects the aggregate for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of volumes to display. The default setting is 25.

## Examples

The following example displays volume statistics:

```
cluster1::> statistics volume show
cluster1 : 12/31/2013 16:00:04

          *Total Read Write Other   Read Write Latency
Volume Vserver Aggregate   Ops  Ops  Ops  Ops  (Bps) (Bps)  (us)
-----
vol0    -    agr0         58  13  15  29 310585 3014   39
vol0    -  agr0_n0        56   0  11  45  8192 28826  47
[...]
```

# statistics vserver show

## Vserver throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for Vservers at a regular interval. The command output displays data in the following columns:

- Vserver - Vserver name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

## Parameters

### **[-vserver <vserver name>] - Vserver**

Selects the vserver for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of Vservers to display. The default setting is 25.

## Examples

The following example displays Vserver statistics:

```
cluster1::> statistics vserver show
```

```
cluster1 : 12/31/2013 16:00:04
```

Vserver	*Total Ops	Read Ops	Write Ops	Other Ops	Read (Bps)	Write (Bps)	Latency (us)
vs1	58	13	15	29	310585	3014	39
vs2	56	0	11	45	8192	28826	47

```
[...]
```

## statistics workload show

QoS workload throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command continuously displays performance data for workloads at a regular interval. The command output displays data in the following columns:

- Workload - workload name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

### Parameters

#### **[-workload <text>] - Workload**

Selects the workload for which you want to display performance data.

#### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

#### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

#### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1.

If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of workloads to display. The default setting is 25.

## Examples

The following example displays workload statistics:

```
cluster1::> statistics workload show
cluster1 : 12/31/2013 16:00:04
```

Workload	*Total Ops	Read Ops	Write Ops	Other Ops	Read (Bps)	Write (Bps)	Latency (us)
_USERSPACE_APPS	30	1	3	0	30765	8553	0
_WAFL_SCAN	20	0	0	0	0	0	0
_WAFL_CP	0	0	0	0	0	0	-

[...]

## statistics-v1 nfs show-mount

Display mount statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **statistics-v1 nfs show-mount** command displays the following statistics about the NFS mounts on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of mount operations
- Total number of dump operations
- Total number of unmount operations
- Total number of unmountall operations
- Total number of export operations
- Total number of exportall operations
- Total number of pathconf operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

### **{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### **[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays statistics only for the specified node.

### **[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

### **[-null <Counter with Delta>] - Null Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

### **[-mount <Counter with Delta>] - Mount Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mount operations.

### **[-dump <Counter with Delta>] - Dump Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of dump operations.

### **[-unmnt <Counter with Delta>] - UnMount Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmount operations.

### **[-unmntall <Counter with Delta>] - UnMountAll Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmountall operations.

### **[-export <Counter with Delta>] - Export Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of export operations.

### **[-exportall <Counter with Delta>] - ExportAll Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of exportall operations.

**[-pathconf <Counter with Delta>] - PathConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the NFS mounts for a node named node1:

```
cluster1::*> statistics-v1 nfs show-mount -node node1
```

Node	Value	Delta
node1	-----success-----	
Null Ops:	2	0/s:16s
Mount Ops:	1	0/s:16s
Dump Ops:	0	-
Unmount Ops:	1	0/s:16s
Unmount All Ops:	0	-
Export Ops:	0	-
ExportAll Ops	0	-
PathConf Ops:	0	-
Total Ops:	4	0/s:16s

Node	Value	Delta
node1	-----failure-----	
Null Ops:	0	-
Mount Ops:	0	-
Dump Ops:	0	-
Unmount Ops:	0	-
Unmount All Ops:	0	-
Export Ops:	0	-
ExportAll Ops	0	-
PathConf Ops:	0	-
Total Ops:	0	-

## statistics-v1 nfs show-nlm

(DEPRECATED)-Display NLM statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **statistics-v1 nfs show-nlm** command displays the following statistics about the Network Lock Manager (NLM) on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of test operations
- Total number of lock operations
- Total number of cancel operations
- Total number of unlock operations
- Total number of granted operations
- Total number of share operations
- Total number of unshare operations
- Total number of nmlock operations
- Total number of freeall operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

This command requires an effective cluster version earlier than Data ONTAP 9.0. Data for nodes running Data ONTAP 9.0 or later is not collected, and will not be displayed. Use the [statistics show`-object`nlm](#) command instead.

## Parameters

**{[-fields <fieldname>,...]}**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**{[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-test <Counter with Delta>] - Test Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of test operations.

**[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

**[-cancel <Counter with Delta>] - Cancel Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of cancel operations.

**[-unlock <Counter with Delta>] - Unlock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unlock operations.

**[-granted <Counter with Delta>] - Granted Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of granted operations.

**[-share <Counter with Delta>] - Share Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of share operations.

**[-unshare <Counter with Delta>] - Unshare Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unshare operations.

**[-nmlock <Counter with Delta>] - NmLock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nmlock operations.

**[-freeall <Counter with Delta>] - FreeAll Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of freeall operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the NLM for a node named node1:

```
cluster1::*> statistics-v1 nfs show-nlm -node node1
```

Node	Value	Delta
node1	-----success-----	
Null:	0	-
Test:	0	-
Lock:	2	0/s:23s
Cancel:	0	-
Unlock:	1	0/s:23s
Granted:	0	-
Share:	0	-
Unshare:	0	-
NmLock:	0	-
FreeAll:	0	-
Total:	3	0/s:23s

Node	Value	Delta
node1	-----failure-----	
Null:	0	-
Test:	0	-
Lock:	0	-
Cancel:	0	-
Unlock:	0	-
Granted:	0	-
Share:	0	-
Unshare:	0	-
NmLock:	0	-
FreeAll:	0	-
Total:	0	-

- [statistics show](#)

# statistics-v1 nfs show-statusmon

Display status monitor statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **statistics-v1 nfs show-statusmon** command displays the following statistics about the Status Monitor on each node in the cluster:

- Result of the operations (success or failure)

- Total number of null operations
- Total number of stat operations
- Total number of monitor operations
- Total number of unmonitor operations
- Total number of unmonitor all operations
- Total number of simucrash operations
- Total number of notify operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-stat <Counter with Delta>] - Stat Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of stat operations.

**[-monitor <Counter with Delta>] - Monitor Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of monitor operations.

**[-unmonitor <Counter with Delta>] - Unmonitor Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor operations.

**[-unmonall <Counter with Delta>] - Unmonitor All Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor all operations.

**[-simucrash <Counter with Delta>] - SimuCrash Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of simucrash operations.

**[-notify <Counter with Delta>] - Notify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of notify operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the status monitor for a node named node1:

```
cluster1::*> statistics-v1 nfs show-statusmon -node node1
```

Node	Value	Delta
node1	-----success-----	
Null Ops:	0	-
Stat Ops:	0	-
Monitor Ops:	0	-
Unmonitor Ops:	0	-
Unmon All Ops:	0	-
SimuCrash Ops:	0	-
Notify Ops:	0	-
Total Ops:	0	-

Node	Value	Delta
node1	-----failure-----	
Null Ops:	0	-
Stat Ops:	0	-
Monitor Ops:	0	-
Unmonitor Ops:	0	-
Unmon All Ops:	0	-
SimuCrash Ops:	0	-
Notify Ops:	0	-
Total Ops:	0	-

## statistics-v1 nfs show-v3

## Display NFSv3 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **statistics-v1 nfs show-v3** command displays the following statistics about the NFSv3 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of getattr operations
- Total number of setattr operations
- Total number of lookup operations
- Total number of access operations
- Total number of readsymlink operations
- Total number of read operations
- Total number of write operations
- Total number of create operations
- Total number of mkdir operations
- Total number of symlink operations
- Total number of mknod operations
- Total number of remove operations
- Total number of rmdir operations
- Total number of rename operations
- Total number of link operations
- Total number of readdir operations
- Total number of readdirplus operations
- Total number of fsstat operations
- Total number of fsinfo operations
- Total number of pathconf operations
- Total number of commit operations
- Total number of nfsv3 operations
- Percent of null operations
- Percent of getattr operations
- Percent of setattr operations
- Percent of lookup operations

- Percent of access operations
- Percent of readsymlink operations
- Percent of read operations
- Percent of write operations
- Percent of create operations
- Percent of mkdir operations
- Percent of symlink operations
- Percent of mknod operations
- Percent of remove operations
- Percent of rmdir operations
- Percent of rename operations
- Percent of link operations
- Percent of readdir operations
- Percent of readdirplus operations
- Percent of fsstat operations
- Percent of fsinfo operations
- Percent of pathconf operations
- Percent of commit operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

### { [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### [ [-instance ] ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### [-node {<nodename>|local}] - Node

If you specify this parameter, the command displays NFSv3 statistics only for the specified node.

### [-result {success|failure|all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

### [-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that

---

have the specified number of null operations.

**[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

**[-setattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

**[-lookup <Counter with Delta>] - LookUp Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

**[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

**[-rsym <Counter with Delta>] - ReadSymlink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readsymlink operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

**[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

**[-mkdir <Counter with Delta>] - Mkdir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mkdir operations.

**[-symlink <Counter with Delta>] - Symlink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of symlink operations.

**[-mknod <Counter with Delta>] - Mknod Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mknod operations.

**[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified number of remove operations.

#### **[-rmdir <Counter with Delta>] - Rmdir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rmdir operations.

#### **[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

#### **[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

#### **[-rdir <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

#### **[-rdirp <Counter with Delta>] - ReadDirPlus Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdirplus operations.

#### **[-fsstat <Counter with Delta>] - FsStat Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsstat operations.

#### **[-fsinfo <Counter with Delta>] - FsInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsinfo operations.

#### **[-pconf <Counter with Delta>] - PathConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

#### **[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

#### **[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total NFSv3 operations.

#### **[-null-pct <Counter with Delta>] - Percent Null Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

#### **[-gattr-pct <Counter with Delta>] - Percent GetAttr Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified percentage of getattr operations.

**[-sattr-pct <Counter with Delta>] - Percent SetAttr Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-lookup-pct <Counter with Delta>] - Percent LookUp Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-access-pct <Counter with Delta>] - Percent Access Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-rsym-pct <Counter with Delta>] - Percent ReadSymlink Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readsymlink operations.

**[-read-pct <Counter with Delta>] - Percent Read Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

**[-write-pct <Counter with Delta>] - Percent Write Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

**[-create-pct <Counter with Delta>] - Percent Create Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-mkdir-pct <Counter with Delta>] - Percent Mkdir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mkdir operations.

**[-symln-pct <Counter with Delta>] - Percent SymLink Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of symlink operations.

**[-mknod-pct <Counter with Delta>] - Percent Mknod Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mknod operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rmdir-pct <Counter with Delta>] - Percent Rmdir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that

have the specified percentage of rmdir operations.

#### **[-rename-pct <Counter with Delta>] - Percent Rename Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

#### **[-link-pct <Counter with Delta>] - Percent Link Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

#### **[-rdir-pct <Counter with Delta>] - Percent ReadDir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

#### **[-rdirp-pct <Counter with Delta>] - Percent ReadDirPlus Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdirplus operations.

#### **[-fsstat-pct <Counter with Delta>] - Percent FsStat Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsstat operations.

#### **[-fsinfo-pct <Counter with Delta>] - Percent FsInfo Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsinfo operations.

#### **[-pconf-pct <Counter with Delta>] - Percent PathConf Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of pathconf operations.

#### **[-commit-pct <Counter with Delta>] - Percent Commit Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

## Examples

The following example displays statistics about the NFSv3 operations for a node named node1:

```
cluster1::> statistics-v1 nfs show-v3 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1	-----success-----			
Null Ops:	4	-	7%	-
GetAttr Ops:	10	-	19%	-
SetAttr Ops:	2	-	4%	-
Lookup Ops:	2	-	4%	-
Access Ops:	14	-	26%	-
ReadSymlink Ops:	0	-	0%	-

Read Ops:	0	-	0%	-
Write Ops:	0	-	0%	-
Create Ops:	2	-	4%	-
MkDir Ops:	1	-	2%	-
Symlink Ops:	0	-	0%	-
MkNod Ops:	0	-	0%	-
Remove Ops:	1	-	2%	-
RmDir Ops:	0	-	0%	-
Rename Ops:	0	-	0%	-
Link Ops:	0	-	0%	-
ReadDir Ops:	2	-	4%	-
ReadDirPlus Ops:	10	-	19%	-
FsStat Ops:	1	-	2%	-
FsInfo Ops:	5	-	9%	-
PathConf Ops:	0	-	0%	-
Commit Ops:	0	-	0%	-
Total Ops:	54	-		

Node	Value	Delta	Percent Ops	Delta
node1	-----failure-----			
Null Ops:	0	-	0%	-
GetAttr Ops:	0	-	0%	-
SetAttr Ops:	0	-	0%	-
Lookup Ops:	2	-	100%	-
Access Ops:	0	-	0%	-

Total Ops:	56	-		

## statistics-v1 nfs show-v4

Display NFSv4 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **statistics-v1 nfs show-v4** command displays the following statistics about the NFSv4 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations

- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations
- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rellockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations

- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of getattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations
- Percent of nverify operations
- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations
- Percent of putpubfh operations
- Percent of putrootfh operations
- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations
- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

### **{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### **[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

### **[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

### **[-null <Counter with Delta>] - Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

### **[-cmpnd <Counter with Delta>] - Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

### **[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

### **[-close <Counter with Delta>] - Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

### **[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

### **[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

### **[-deipur <Counter with Delta>] - Deleypurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of deleypurge operations.

**[-delrtn <Counter with Delta>] - Delegret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delegret operations.

**[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of gattr operations.

**[-getfh <Counter with Delta>] - GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

**[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

**[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

**[-lockt <Counter with Delta>] - LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

**[-locku <Counter with Delta>] - LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

**[-lookup <Counter with Delta>] - Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

**[-lookpp <Counter with Delta>] - LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

**[-nverfy <Counter with Delta>] - Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

**[-open <Counter with Delta>] - Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

**[-opatrr <Counter with Delta>] - OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

**[-opconf <Counter with Delta>] - OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

**[-opndg <Counter with Delta>] - OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

**[-putfh <Counter with Delta>] - PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

**[-putpfh <Counter with Delta>] - PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

**[-putrfh <Counter with Delta>] - PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-readdir <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

**[-rlink <Counter with Delta>] - ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

**[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

**[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

**[-renew <Counter with Delta>] - Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

**[-restfh <Counter with Delta>] - RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

**[-savefh <Counter with Delta>] - SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

**[-secinf <Counter with Delta>] - SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

**[-sattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

**[-sclid <Counter with Delta>] - SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

**[-scidc <Counter with Delta>] - SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

**[-verify <Counter with Delta>] - Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

**[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

**[-relown <Counter with Delta>] - RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total nfsv4 operations.

**[-null-pct <Counter with Delta>] - Percent Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

**[-access-pct <Counter with Delta>] - Percent Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-close-pct <Counter with Delta>] - Percent Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**[-create-pct <Counter with Delta>] - Percent Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-deipur-pct <Counter with Delta>] - Percent Deleypurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of deleypurge operations.

**[-delrtn-pct <Counter with Delta>] - Percent Delegret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegret operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-getfh-pct <Counter with Delta>] - Percent GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

**[-link-pct <Counter with Delta>] - Percent Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-lock-pct <Counter with Delta>] - Percent Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

**[-lockt-pct <Counter with Delta>] - Percent LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

**[-locku-pct <Counter with Delta>] - Percent LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

**[-lookup-pct <Counter with Delta>] - Percent Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

**[-nverify-pct <Counter with Delta>] - Percent Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

**[-open-pct <Counter with Delta>] - Percent Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

**[-opatrr-pct <Counter with Delta>] - Percent OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

**[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

**[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

**[-putfh-pct <Counter with Delta>] - Percent PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

**[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

**[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

**[-read-pct <Counter with Delta>] - Percent Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

**[-readdr-pct <Counter with Delta>] - Percent ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

**[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-renew-pct <Counter with Delta>] - Percent Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

**[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

**[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

**[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

**[-setattr-pct <Counter with Delta>] - Percent SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-setclid-pct <Counter with Delta>] - Percent SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclid operations.

**[-setclidc-pct <Counter with Delta>] - Percent SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclidconf operations.

**[-verify-pct <Counter with Delta>] - Percent Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

**[-write-pct <Counter with Delta>] - Percent Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

**[-relown-pct <Counter with Delta>] - Percent RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rellockown operations.

# Examples

The following example displays statistics about the NFSv4 operations for a node named node1:

```
cluster1::> statistics-v1 nfs show-v4 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1	-----success-----			
Null Procs:	2	-	1%	-

## statistics-v1 nfs show-v41

Display NFSv41 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **statistics-v1 nfs show-v41** command displays the following statistics about the NFSv4.1 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations

- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations
- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations

- Total number of write operations
- Total number of relockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of getattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations
- Percent of nverify operations
- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations
- Percent of putpubfh operations
- Percent of putrootfh operations
- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations

- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

### { [-fields <fieldname>,...]

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### [-instance ]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### [-node {<nodename>|local}] - Node

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

### [-result {success|failure|all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

### [-null <Counter with Delta>] - Null Procedure

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

### [-cmpnd <Counter with Delta>] - Compound Procedure

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

### [-access <Counter with Delta>] - Access Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

### [-close <Counter with Delta>] - Close Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

**[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

**[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

**[-delepur <Counter with Delta>] - Delepur Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delepur operations.

**[-delrtn <Counter with Delta>] - Delegrt Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delegrt operations.

**[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of gattr operations.

**[-getfh <Counter with Delta>] - GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

**[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

**[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

**[-lockt <Counter with Delta>] - LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

**[-locku <Counter with Delta>] - LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

**[-lookup <Counter with Delta>] - Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

**[-lookpp <Counter with Delta>] - LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookpp operations.

**[-nverify <Counter with Delta>] - Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

**[-open <Counter with Delta>] - Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

**[-opattn <Counter with Delta>] - OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

**[-opconf <Counter with Delta>] - OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

**[-opndg <Counter with Delta>] - OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

**[-putfh <Counter with Delta>] - PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

**[-putpfb <Counter with Delta>] - PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

**[-putrfh <Counter with Delta>] - PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-readdir <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

**[-rlink <Counter with Delta>] - ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

**[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

**[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

**[-renew <Counter with Delta>] - Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

**[-restfh <Counter with Delta>] - RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

**[-savefh <Counter with Delta>] - SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

**[-secinf <Counter with Delta>] - SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

**[-sattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

**[-sclid <Counter with Delta>] - SetCliid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

**[-scidc <Counter with Delta>] - SetCliidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

**[-verify <Counter with Delta>] - Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

**[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

**[-relown <Counter with Delta>] - RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total nfsv4 operations.

**[-null-pct <Counter with Delta>] - Percent Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

**[-access-pct <Counter with Delta>] - Percent Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-close-pct <Counter with Delta>] - Percent Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**[-create-pct <Counter with Delta>] - Percent Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-deipur-pct <Counter with Delta>] - Percent Deleypurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of deleypurge operations.

**[-delrtn-pct <Counter with Delta>] - Percent Deleypret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of deleypret operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-getfh-pct <Counter with Delta>] - Percent GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

**[-link-pct <Counter with Delta>] - Percent Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-lock-pct <Counter with Delta>] - Percent Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

**[-lockt-pct <Counter with Delta>] - Percent LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

**[-locku-pct <Counter with Delta>] - Percent LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

**[-lookup-pct <Counter with Delta>] - Percent Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

**[-nverify-pct <Counter with Delta>] - Percent Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

**[-open-pct <Counter with Delta>] - Percent Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

**[-opattn-pct <Counter with Delta>] - Percent OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

**[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

**[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

**[-putfh-pct <Counter with Delta>] - Percent PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

**[-putpfb-pct <Counter with Delta>] - Percent PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

**[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

**[-read-pct <Counter with Delta>] - Percent Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

**[-readdir-pct <Counter with Delta>] - Percent ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

**[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-renew-pct <Counter with Delta>] - Percent Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

**[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

**[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

**[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

**[-setattr-pct <Counter with Delta>] - Percent SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-setclid-pct <Counter with Delta>] - Percent SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclid operations.

**[-scidc-pct <Counter with Delta>] - Percent SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclidconf operations.

**[-verify-pct <Counter with Delta>] - Percent Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

**[-write-pct <Counter with Delta>] - Percent Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

**[-relovn-pct <Counter with Delta>] - Percent RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of relockown operations.

## Examples

The following example displays statistics about the NFSv4.1 operations for a node named node1:

```
cluster1::> statistics-v1 nfs show-v41 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1	-----success-----			
Null Procs:	2	-	1%	-

## statistics-v1 protocol-request-size show

Display size statistics for CIFS and NFS protocol read and write requests

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays size statistics for CIFS and NFS protocol read and write requests. The output of the command includes the following information:

- Node name
- Statistic type
- Average size of request
- Total request count
- Current number of requests in each category of request size
- Number of requests after the command was last executed

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays statistics only for the specified node.

**[-stat-type <Protocol Type>] - RW Request Stat Type**

If this parameter is specified, the command displays only the statistics of the specified protocol type. Protocol types include the following: cifs\_read, cifs\_write, nfs2\_read, nfs2\_write, nfs3\_read, and nfs3\_write.

**[-total-req-count <Counter64 with Delta>] - Total Request Count**

If this parameter is specified, the command displays only statistics with the specified total number of requests.

**[-average-size <Counter64 with Delta>] - Average Request Size**

If this parameter is specified, the command displays only statistics with the specified average request size.

**[-histo08 <Counter64 with Delta>] - 0 - 511**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo09 <Counter64 with Delta>] - 512 - 1023**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo10 <Counter64 with Delta>] - 1024 - 2047**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo11 <Counter64 with Delta>] - 2048 - 4096**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo12 <Counter64 with Delta>] - 4096 - 8191**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo13 <Counter64 with Delta>] - 8192 - 16K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo14 <Counter64 with Delta>] - 16K - 32K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo15 <Counter64 with Delta>] - 32K - 64K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo16 <Counter64 with Delta>] - 64K - 128K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo17 <Counter64 with Delta>] - Greater than 128K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

## Examples

The following example displays the number of NFS v3 requests in each size range for only one node in the cluster.

```
cluster1::> statistics protocol-request-size show -stat-type nfs3_* -node node0
```

```
Node:                node0
Stat Type:           nfs3_read
Value                Delta
-----
```

```

Average Size:                6                -

```

## storage-service show

Display the available storage services

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays the available storage services.

The available storage services are defined by the type of storage making up an aggregate.

## Parameters

### { [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

### [ [-instance ] ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### [ -vserver <vserver name> ] - Vserver

Selects the available storage services for Vservers that match the parameter value.

### [ -storage-service <text> ] - Storage Service

Selects the available storage services whose name matches the parameter value.

### [ -description <text> ] - Description

Selects the available storage services whose description matches the parameter value. This field is a text description of the storage service.

### [ -expected-iops-per-tb <integer> ] - Expected IOPS per TB

Selects the available storage services whose expected IOPS per TB matches the parameter value. When multiplied by a number of TB, this field yields the number of IOPS nominally guaranteed by the storage service. The multiplier is either the logical used space or the provisioned size of the storage object, depending on the value of **expected-iops-allocation**.

### [ -expected-iops-allocation {used-space|allocated-space} ] - Expected IOPS Allocation

Selects the available storage services whose expected IOPS allocation policy matches the parameter value. The allocation policy is either **allocated-space** or **used-space**. When the expected-iops-allocation policy is **allocated-space**, the expected IOPS is calculated based on the size of the storage object. When the expected-iops-allocation policy is set to **used-space**, the expected IOPS is calculated based on the amount of data logically stored in the storage object.

### [ -peak-iops-per-tb <integer> ] - Peak IOPS per TB

Selects the available storage services whose peak IOPS per TB matches the parameter value. When multiplied by a number of TB, this field yields the number of IOPS for the maximum Quality of Service (QoS) throttle. The multiplier is either the logical used space or the provisioned size of the storage object, depending on the value of **peak-iops-allocation**.

### [ -peak-iops-allocation {used-space|allocated-space} ] - Peak IOPS Allocation

Selects the available storage services whose peak IOPS allocation policy matches the parameter value. The allocation policy is either **allocated-space** or **used-space**. When the peak-iops-allocation policy is **allocated-space**, the peak IOPS is calculated based on the size of the storage object. When the peak-iops-allocation policy is set to **used-space**, the peak IOPS is calculated based on the amount of data logically stored in the storage object.

**[-absolute-min-iops <integer>] - Absolute Minimum IOPS**

Selects the available storage services whose absolute minimum IOPS matches the parameter value. This field is the minimum number of IOPS used as the Quality of Service (QoS) throttle, if larger than the values calculated using the IOPS per TB parameters.

**[-target-latency <integer>] - Target Latency (ms)**

Selects the available storage service whose target latency matches the parameter value.

**[-aggr-list <aggregate name>,...] - Aggregate List**

Selects the available storage services whose aggregate list matches the parameter value. The aggregates shown are the only ones used for provisioning when the corresponding Vserver and storage service are selected.

## Examples

```
cluster1::*> storage-service show
Vserver Storage Service Description
-----
vs1
    extreme      Extreme Performance
    performance  Performance
    value        Value
3 entries were displayed.
```

The example above displays all the storage services in the cluster.

## storage aggregate add-disks

Add disks to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate add-disks** command adds disks to an existing aggregate. You must specify the number of disks or provide a list of disks to be added. If you specify the number of disks without providing a list of disks, the system selects the disks.

## Parameters

**-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to which disks are to be added.

**[-diskcount <integer>] - Disk Count**

This parameter specifies the number of disks that are to be added to the aggregate.

## { [-T, -disktype {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type

This parameter specifies the type of disk that is to be added. It must be specified with the **-diskcount** parameter when adding disks to a Flash Pool.

Use this parameter when adding spare SSDs to an aggregate to convert it to a Flash Pool.

Only the aggregates marked as **hybrid-enabled** can be converted to Flash Pools. Use `storage aggregate modify` command to mark the aggregate as **hybrid-enabled**.

When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`. Only disks of the specified type are considered eligible for selection.

## [-C, -diskclass {capacity | performance | archive | solid-state | array | virtual}] - Disk Class

This parameter specifies the class of disk that is to be added. All disks that belong to the specified class are considered eligible for selection. The possible values are:

- `capacity` = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- `performance` = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- `archive` = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- `solid-state` = Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM.
- `array` = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- `virtual` = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`.

## [-checksumstyle <aggrChecksumStyle>] - Checksum Style

This parameter specifies the checksum style for the disks to be added to an aggregate. It is not applicable if **-disklist** or **-mirror-disklist** is specified. The possible values are **block** for block checksum and **advanced\_zoned** for advanced zoned checksum (AZCS). By default, disks with the same checksum style as the aggregate are selected. This behavior can be overridden by using this parameter to create a mixed checksum aggregate. A mixed checksum aggregate can support only the **block** and **advanced\_zoned** checksum styles.

## [-disksize <integer>] - Disk Size(GB)

This parameter specifies the size, in GB, of the disks that are to be added to the aggregate. Disks with a usable size between 90% and 105% of the specified size are selected.

**[`-d, -disklist <disk path name>,...`] - Disks**

This parameter specifies a list of disks to be added. If you specify the `-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum style, size or type.

**[`-mirror-disklist <disk path name>,...`] - Disks for Mirrored Plex**

This parameter specifies a list of mirror disks to be added. It must contain the same number of disks specified in `-disklist` parameter. If you specify the `-mirror-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum style or type.

**{ [`-ignore-pool-checks <true>`] - Don't Enforce Plex Pool Best Practices**

The disks in a plex are normally required to come from the same SyncMirror pool. This behavior can be overridden with this parameter when it is set to **true**.

**[`-f, -allow-mixed-rpm <true>`] - Allow Disks With Different RPM Values**

This parameter specifies whether disks that have different RPM values can be added. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to **true** and a list of disks are provided by using the `-disklist` parameter, the disks will be added even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

+

NOTE: This parameter is applicable only when the `-disklist` or `-mirror-disklist` parameter is used.

**[`-allow-same-carrier <true>`] - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you add disks to an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can add a disk to an aggregate that causes this situation, but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, allow Data ONTAP to choose disks that need to be added to the aggregate.

This parameter affects only the add-disks operation. It is not a persistent attribute of the aggregate.

**[`-storage-pool <storage pool name>`] - Storage Pool**

This parameter specifies the name of the SSD storage pool from which available allocation units are added to a given aggregate. This parameter cannot be used with the `-disk-list` or `-disk-count` parameters.

**[`-allocation-units <integer>`] - Allocation Units }**

This parameter specifies the number of allocation units to be added to a given aggregate from an SSD storage pool. Number of allocation units available and size of each unit can be found using the `storage pool show-available-capacity` command. This parameter works only when you also use the `-storage-pool` parameter.

**[-n, -simulate <true>] - Simulate Addition of Disks**

This parameter is used with the `disktype` and `diskcount` parameters to determine which disks would be added without actually performing the addition of disks operation.

**[-g, -raidgroup {new|all|<raidgroup>}] - RAID Group**

This parameter enables the administrator to specify which RAID group will receive the added disks. If this parameter is not used, the disks are added to the most recently created RAID group until it is full, then new RAID groups are created and filled until all the disks are added. If a RAID group name `rgX` is specified, the disks are added to that RAID group. If `new` is specified, the disks are added to a new RAID group, even if the disks would fit into an existing RAID group. If `all` is specified, the disks are added to existing RAID groups until all existing RAID groups are full. Then Data ONTAP creates one or more new RAID groups and adds the remaining disks to the new groups. If the disk type or checksum style parameters are specified with this parameter, the command operates only on the RAID groups with the matching disk type or checksum style, even if `all` is specified.

**[-cache-raid-group-size <integer>] - RAID Group Size for Cache Tier**

This parameter specifies the maximum number of disks that can be included in an SSD RAID group for this aggregate.

This parameter is applicable only when adding SSDs for the first time to a hybrid-enabled aggregate. If this parameter is not used when the first SSDs are added to the aggregate, the maximum RAID group size for the SSD cache is set to the default SSD RAID group size for the RAID type of the SSD cache.

**[-t, -raidtype {raid\_tec|raid\_dp|raid4|raid\_ep}] - RAID Type**

This parameter specifies the type for the new RAID groups that would be created while adding disks to the aggregate. Use this parameter when you add the first RAID group comprised of SSDs to a hybrid-enabled aggregate. The values are `raid4` for RAID4, `raid_dp` for RAID Double Parity, and `raid_tec` for RAID-TEC. The default value is the type of RAID groups of the aggregate, except for RAID-TEC hybrid-enabled aggregates where the SSD tier will default to `raid_dp`. An aggregate might include a mix of different RAID types.

## Examples

The following example adds 10 disks to an aggregate named `aggr0`. The disks are added to a RAID group named `rg1`:

```
cluster1::> storage aggregate add-disks -aggregate aggr0 -diskcount 10 -raidgroup rg1
```

In this example, an aggregate is converted to a Flash Pool aggregate using SSD capacity from a storage pool. The aggregate was created using RAID-DP for the hard disks and the SSDs are added using RAID4.

```
cluster1::> storage aggregate add-disks -aggregate FlashPool -storage-pool SP1
```

```
-allocation-units 1 -raidtype raid4
```

## Related Links

- [storage aggregate modify](#)
- [storage pool show-available-capacity](#)

# storage aggregate auto-provision

Recommend and create new aggregates in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command analyzes available spare disks in the cluster, and it provides a recommendation how spare disks should be used to create aggregates according to best practices. The command prints the summary of recommended aggregates including their names and usable size. It then prompts the user whether or not the aggregates should be created as recommended. On positive response, ONTAP creates the aggregates as described in the recommendation.

The command parameters allow to restrict the command to some nodes in the cluster, print more details about recommended aggregates, and to skip the prompt.

## Parameters

### **[-nodes {<nodename>|local}] - List of Nodes**

Comma separated list of node names to which the command applies. If this parameter is not used, the command applies to all nodes in the cluster.

### **[-verbose <true>] - Report More Details**

Report additional details about recommended aggregates and spare disks. Per node summary shows number and total size of aggregates to create, discovered spares, and also remaining spare disks and partitions after aggregate creation. RAID group layout shows how spare disks and partitions will be used in new data aggregates to be created. The last table shows spare disks and partitions remaining unused after aggregate creation.

### **[-skip-confirmation <true>] - Skip the Confirmation and Create Recommended Aggregates**

When this parameter is used, the command automatically creates the recommended aggregates. When this parameter is not used, the command checks to proceed with aggregate creation or not.

The command is not affected by the CLI session setting: `set`-confirmations`on /off`.

## Examples

```
cluster1::storage aggregate> auto-provision
Node                New Data Aggregate          Usable Size
-----
node1                node1_SSD_1                 3.66TB
node2                node2_SSD_1                 3.66TB
-----
Total:               2 new data aggregates      7.32TB
```

Do you want to create recommended aggregates? {y|n}: n

```
cluster1::storage aggregate> auto-provision -verbose
Per node summary of new aggregates to create, discovered spares, and also
remaining spare disks and partitions after aggregate creation:
New    Total New -Discovered Spare- -Remaining Spare-
Node   Aggrs Usable Size  Disks  Partitions  Disks Partitions
-----
node1   1     3.66TB     6      48         1       0
node2   1     3.66TB     6      48         1       0
-----
Total:  2     7.32TB    12     96         2       0
```

New data aggregates to create with counts of disks and partitions to be used:

```
Is Usable -Devices To Use-
Node   New Data Aggregate          Mirrored    Size  Disks Partitions
-----
node1   node1_SSD_1                 false      3.66TB  5     48
node2   node2_SSD_1                 false      3.66TB  5     48
```

RAID group layout showing how spare disks and partitions will be used in new data aggregates to be created:

```
RAID Group In New          Disk      Usable Disk Or  ---Count---
Data Aggregate To Be Created  Type      Size Partition Data Parity
-----
/node1_SSD_1/plex0/rg0       SSD      81.97GB partition  22     2
/node1_SSD_1/plex0/rg1       SSD      81.97GB partition  22     2
/node1_SSD_1/plex0/rg2       SSD      185.5GB disk     3      2
/node2_SSD_1/plex0/rg0       SSD      81.97GB partition  22     2
/node2_SSD_1/plex0/rg1       SSD      81.97GB partition  22     2
/node2_SSD_1/plex0/rg2       SSD      185.5GB disk     3      2
```

Details about spare disks and partitions remaining after aggregate creation:

```
Disk      Device Disk Or    Pool Remaining
Node      Type   Usable Size Partition Number  Spares
-----
node1     SSD    185.5GB disk     Pool0           1
node2     SSD    185.5GB disk     Pool0           1
```

```
Do you want to create recommended aggregates? {y|n}: y
```

```
Info: Aggregate auto provision has started. Use the "storage aggregate  
show-auto-provision-progress" command to track the progress.

# storage aggregate create

Create an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate create** command creates an aggregate. An aggregate consists of disks. You must specify the number of disks or provide a list of disks to be added to the new aggregate. If you specify the number of disks without providing a list of disks, the system selects the disks.

When creating an aggregate, you can optionally specify the aggregate's home node, the RAID type for RAID groups on the aggregate, and the maximum number of disks that can be included in a RAID group.

## Parameters

### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the name of the aggregate that is to be created.

### **[-checksumstyle <aggrChecksumStyle>] - Checksum Style**

This parameter specifies the checksum style for the aggregate. The values are **block** for Block Checksum and **advanced\_zoned** for Advanced Zoned Checksum (AZCS).

### **-diskcount <integer> - Number Of Disks**

This parameter specifies the number of disks that are to be included in the aggregate, including the parity disks. The disks in this newly created aggregate come from the pool of spare disks. The smallest disks in this pool are added to the aggregate first, unless you specify the **-disksize** parameter.

### **[-R, -diskrpm <integer>] - Disk RPM**

This parameter specifies the RPM of the disks on which the aggregate is to be created. The possible values include 5400, 7200, 10000, and 15000.

**[-disksize <integer>] - Disk Size(GB)**

This parameter specifies the size, in GB, of the disks on which the aggregate is to be created. Disks with a usable size between 90% and 105% of the specified size are selected.

**{[-T, -disktype {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

This parameter specifies the type of disk on which the aggregate is to be created.

When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity` , `raid.mix.hdd.disktype.performance` , or `raid.mix.disktype.solid_state` . Only disks of the specified type are considered eligible for selection.

**[-C, -diskclass {capacity | performance | archive | solid-state | array | virtual}] - Disk Class**

This parameter specifies the class of disks on which the aggregate is to be created. All disks that belong to the specified class are considered eligible for selection. The possible values are:

- `capacity` = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- `performance` = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- `archive` = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- `solid-state` = Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM.
- `array` = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- `virtual` = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity` , `raid.mix.hdd.disktype.performance` , or `raid.mix.disktype.solid_state` .

**[-m, -mirror <true>] - Is Mirrored**

This parameter specifies that the new aggregate be mirrored (have two plexes). If this parameter is set to **true** , the specified disks are split between the two plexes. By default, the new aggregate will not be mirrored. You cannot use the `-mirror` parameter when supplying a specific list of disks with either the `-disklist` or `-mirror-disklist` parameters.

**[-pool <aggrSparePool>] - Spare Pool**

This parameter specifies the SyncMirror pool to be used to supply the disks for the aggregate. Valid values are Pool0 or Pool1.

**[-d, -disklist <disk path name>,... - Disks for First Plex**

This parameter specifies a list of disks to be added to the new aggregate. If you specify the `-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum

style, type, size, or RPM. You cannot use the **-disklist** parameter when the **-mirror** parameter is set to **true**.

#### **[-mirror-disklist <disk path name>,...] - Disks for Mirrored Plex**

This parameter specifies a list of mirror disks to be added to the new mirrored aggregate. It must contain the same number of disks specified in **-disklist** parameter. If you specify the **-mirror -disklist** parameter, you cannot further qualify the list of disks to be added by count, checksum style, type, size, or RPM. You cannot use the **-mirror-disklist** parameter when the **-mirror** parameter is set to **true**.

#### **[-ignore-pool-checks <true>] - Don't Enforce Plex Pool Best Practices**

The disks in a plex are normally required to come from the same SyncMirror pool. This behavior can be overridden with this parameter when it is set to **true**. This option cannot be used when the **-mirror** option is set to **true**.

#### **[-f, -allow-mixed-rpm <true>] - Allow Disks With Different RPM Values**

This parameter specifies whether the aggregate can contain disks that have different RPM values. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to **true** and a list of disks are provided by using the **-disklist** parameter, the aggregate will be created even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

#### **[-allow-same-carrier <true>] - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you add disks to an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You create an aggregate with this characteristic, but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, allow Data ONTAP to choose the disks from which to create the aggregate.

This parameter affects only the aggregate creation operation. It is not a persistent attribute of the aggregate.

#### **[-node {<nodename>|local}] - Node**

This parameter specifies the home node for the aggregate. If this parameter is not specified, Data ONTAP selects the node where the aggregate is created.

#### **[-s, -maxraidsize <integer>] - Max RAID Size**

This parameter specifies the maximum number of disks that can be included in a RAID group.

#### **[-t, -raidtype {raid\_tec|raid\_dp|raid4|raid\_ep}] - RAID Type**

This parameter specifies the type for RAID groups on the aggregate. The values are **raid4** for RAID4 of disks other than **SSD-ZNS**, **raid\_ep** for RAID4 of **SSD-ZNS** disks plus RAID4 inside each **SSD-ZNS** disk, **raid4** for RAID4, **raid\_dp** for RAID Double Parity, and **raid\_tec** for RAID Triple-Erasure-Code. The default setting is **raid\_dp** for disks other than **SSD-ZNS** unless the disks are HDDs with a

capacity larger than 4 TB, in which case the default will be **raid\_tec** . For **SSD-ZNS** disks the default setting will be **raid\_ep** . This parameter is not needed for array LUNs because they are always created with the **raid0** raidtype. **raid4** and **raid\_ep** are not compatible with shared disks unless the shared disks belong to a storage pool.

#### **[-simulate <true>] - Simulate Aggregate Provisioning Operation**

This option simulates the aggregate creation and prints the layout of the new aggregate.

#### **[-force-small-aggregate <true>] - Force the Creation of a Small Aggregate**

This parameter can be used to force the creation of a 2-disk RAID4 and RAID-EP aggregates, or a 3-disk or 4-disk RAID-DP aggregate.

#### **[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate**

This specifies whether the aggregate will be considered by the Auto Balance Aggregate feature. If the Auto Balance Aggregate feature is not used, this field is not used. When this parameter is set to **true** the Auto Balance Aggregate feature might recommend moving volumes to or from this aggregate in order to balance system workload. When this parameter is set to **false** the aggregate will not be considered as a destination for the Auto Balance Aggregate feature allowing for predictability in data placement. The default value is **false** .

#### **[-L, -snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

This parameter specifies the type of SnapLock aggregate to be created. In order to create a SnapLock Compliance aggregate, specify **compliance** . To create a SnapLock Enterprise aggregate, specify **enterprise** .

#### **[-autobalance-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered Unbalanced (%)**

This parameter specifies the space used threshold percentage that will cause the Auto Balance Aggregate feature to consider an aggregate as unbalanced.

#### **[-autobalance-available-threshold-percent <integer>] - Threshold When Aggregate Is Considered Balanced (%)**

This parameter specifies the threshold percentage which will determine if an aggregate is a target destination for a move. The Auto Balance Aggregate feature will attempt to move volumes from an unbalanced aggregate until it is under this percentage.

#### **[-encrypt-with-aggr-key {true|false}] - Enable Aggregate level Encryption**

This parameter specifies the data encryption policy for the contained volumes. If this parameter is set to **true** , then by default, the volumes created in this aggregate will be encrypted, using the aggregate level encryption keys.

## Examples

The following example creates an aggregate named `aggr0` on a home node named `node0`. The aggregate contains 20 disks and uses RAID-DP. The aggregate contains regular FlexVol volumes:

```
cluster1::> storage aggregate create -aggregate aggr0 -nodes node0
```

```
-diskcount 20 -raidtype raid_dp -volume-style flex
```

The following example creates an aggregate named `aggr0` on a home node named `node0`. The aggregate contains the disks specified and uses RAID-DP

```
cluster1::> storage aggregate create -aggregate aggr0 -nodes node0  
-disklist 1.0.15,1.0.16,1.0.17,1.0.18,1.0.19 -raidtype raid_dp
```

The following example creates an aggregate named `aggr0` on a home node named `node0`. The aggregate contains 20 disks of size 6 TB and of type FSAS and uses RAID-TEC:

```
cluster1::> storage aggregate create -aggregate aggr0 -nodes node0  
-diskcount 20 -raidtype raid_tec -disksize 6000 -disktype FSAS
```

The following example creates a mirrored aggregate named `aggr0` on the local node. The aggregate contains 10 disks in each plex:

```
cluster1::> storage aggregate create -aggregate aggr0 -mirror  
-diskcount 20
```

## storage aggregate delete

Delete an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate delete** command deletes a storage aggregate. The command fails if there are volumes present on the aggregate. If the aggregate has an object store attached to it, then in addition to deleting the aggregate the command deletes the objects in the object store as well. No changes are made to the object store configuraton as part of this command.

### Parameters

**-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate that is to be deleted.

**[-preserve-config-data <true>] - Delete Physical Aggregate but Preserve Configuration Data**

Deletes the physical aggregate, but preserves the aggregate configuration data. The aggregate must not have any disks associated with it. If the parameter **-preserve-config-data** is specified without a value, the default value is **true** ; if this parameter is not specified, the default value is **false** .

## Examples

The following example deletes an aggregate named `aggr1`:

```
cluster1::> storage aggregate delete -aggregate aggr1
```

## storage aggregate mirror

Mirror an existing aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate mirror` command adds a plex to an existing unmirrored aggregate. You can specify a list of disks to be used for the mirrored plex. If you do not specify the disks, the system automatically selects the disks based on the aggregate's existing plex.

## Parameters

### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to mirror.

### **[-f, -allow-mixed-rpm <true>] - Allow Disks With Different RPM Values**

This parameter specifies whether disks that have different RPM values can be used. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to **true** and a list of disks are provided by using the `-mirror-disklist` parameter, the disks will be added even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

+

NOTE: This parameter is only applicable when the `-mirror-disklist` parameter is used.

### **[-d, -mirror-disklist <disk path name>,...] - Disks for Mirrored Plex**

This parameter specifies a list of disks to be used for the plex to be added. It must contain the same number of disks as the existing plex of the unmirrored aggregate specified using the `-aggregate` parameter.

### **[-ignore-pool-checks <true>] - Don't Enforce Plex Pool Best Practices**

For maximum reliability, all disks from a plex should come from the same SyncMirror pool, and the disks for the second plex should all come from the other pool. If needed, this behavior can be overridden by setting this parameter to **true**. This parameter can be used only with the `-mirror-disklist` parameter.

**[-f, -allow-same-carrier <true>] - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group for a mirrored aggregate. Having disks in the same carrier in the same RAID group is not desirable, because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. For this reason, this configuration is not allowed by default. This restriction can be overridden by setting this parameter to **true** .

+

NOTE: This parameter is accepted only when the **-mirror-disklist** parameter is used.

**[-n, -simulate <true>] - Simulate Mirroring of an Existing Aggregate**

This option simulates the mirroring of an existing aggregate and prints the layout of the new plex.

## Examples

The following example mirrors an unmirrored aggregate aggr1:

```
cluster1::> storage aggregate mirror -aggregate aggr1
```

The following example mirrors an unmirrored aggregate aggr1. The specified disks are used for the new plex.

```
cluster1::> storage aggregate mirror -aggregate aggr1 -mirror-disklist 1.2.12, 1.2.14, 1.2.16
```

## storage aggregate modify

Modify aggregate attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate modify** command can be used to modify attributes of an aggregate such as RAID type and maximum RAID group size.

Changing the RAID type immediately changes the RAID group type for all RAID groups in the aggregate.

Changing the maximum RAID size does not cause existing RAID groups to grow or to shrink; rather, it affects the size of RAID groups created in the future, and determines whether more disks can be added to the RAID group that was most recently created.

## Parameters

### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the storage aggregate that is to be modified.

### **[-T, -disktype {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

This parameter specifies the disk type of the RAID groups to be modified. In case of Flash Pool, it specifies either the HDD tier or the SSD tier. If the HDD tier is composed of more than one type of disk, specifying any of the disk types in use causes that tier to be modified. If the current aggregate RAID type is `mixed_raid_type`, this parameter is mandatory.

### **[-free-space-realloc {on|off}] - Free Space Reallocation**

This parameter specifies whether free space reallocation is enabled on the aggregate.

Free space reallocation optimizes the free space in an aggregate immediately before Data ONTAP writes data to the blocks in that aggregate. This field is not allowed on aggregates with SSD-ZNS disks.

The default setting is **off**.

### **[-ha-policy {sfo|cfo}] - HA Policy**

This parameter specifies the high-availability policy to be used in the context of a root recovery procedure. Do not modify this setting unless directed to do so by a customer support representative.

### **[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies**

This parameter is used to set the space reserved for Snapshot copies to the specified value. For example, to set the snapshot reserve to 5%, you should enter `-percent-snapshot-space 5`.

### **[-space-nearly-full-threshold-percent <percent>] - Aggregate Nearly Full Threshold Percent**

This optionally specifies the percentage at which the aggregate is considered nearly full, and above which an EMS warning will be generated. The default value is 95%. The maximum value for this option is 99%. Setting this threshold to 0 disables the aggregate nearly full space alerts.

### **[-space-full-threshold-percent <percent>] - Aggregate Full Threshold Percent**

This optionally specifies the percentage at which the aggregate is considered full, and above which a critical EMS error will be generated. The default value is 98%. The maximum value for this option is 100%. Setting this threshold to 0 disables the aggregate full space alerts.

### **[-hybrid-enabled {true|false}] - Hybrid Enabled**

If the hybrid-enabled option is set to "true", the aggregate is marked as `hybrid_enabled`, that is, the aggregate can contain a mix of SSDs and HDDs (Hard Disk Drives, e.g., SAS, SATA, and/or FC). By default, aggregates cannot be marked "hybrid\_enabled" if the aggregate contains FlexVols that cannot be write cached. A FlexVol cannot be write-cached if it is part of an aggregate created in Data ONTAP 7. Use **-force-hybrid-enabled** to over-ride this behavior.

**[-f, -force-hybrid-enabled <true>] - Force Marking of Aggregate as Hybrid Enabled**

By default, aggregates cannot be marked "hybrid\_enabled" if the aggregate contains FlexVols that cannot be write cached. A FlexVol cannot be write-cached if it is part of an aggregate created in Data ONTAP 7. Use **-force-hybrid-enabled** to over-ride this behavior. Note that read caching will be enabled on these FlexVols, but write caching will be disabled.

**[-s, -maxraidsize <integer>] - Max RAID Size**

This parameter specifies the maximum number of disks that can be included in a RAID group for this aggregate.

For Flash Pools, this option controls the maximum size of the HDD RAID groups.

**[-cache-raid-group-size <integer>] - Flash Pool SSD Tier Maximum RAID Group Size**

This parameter specifies the maximum number of disks that can be included in a SSD RAID group for this Flash Pool.

This parameter is applicable only for Flash Pools.

**[-t, -raidtype {raid\_tec|raid\_dp|raid4|raid\_ep}] - RAID Type**

This parameter specifies the RAID type for RAID groups on the aggregate. The possible values are **raid4** for RAID4 of disks other than **SSD-ZNS**, **raid\_ep** for RAID4 of **SSD-ZNS** disks with additional RAID4 protection inside each disk, **raid\_dp** for RAID-DP, and **raid\_tec** for RAID-TEC. If you change the RAID type from RAID4 or RAID-EP to RAID-DP, each RAID group allocates a spare disk for the group's second parity disk and begins a reconstruction process. If you change the RAID type from RAID-DP to RAID-TEC, each RAID group allocates a spare disk for the group's third parity disk and begins a reconstruction process. Changing the RAID type from RAID4 and RAID-EP to RAID-TEC or vice-versa is not supported. To change the RAID type from RAID4 or RAID-EP to RAID-TEC, first change from RAID4 or RAID-EP to RAID-DP and then to RAID-TEC.

**[-resyncsnaptime <integer>] - SyncMirror Resync Snapshot Frequency in Minutes**

This parameter sets the mirror resynchronization snapshot frequency to be the given number of minutes. The default value is 60 (minutes).

**[-state <aggregate state>] - State**

This deprecated parameter specifies the state of the aggregate. The possible values are as follows:

- online - Immediately sets the aggregate online. All volumes on the aggregate are set to the state they were in when the aggregate was taken offline or restricted. The preferred command to bring an aggregate online is **storage aggregate online**.
- offline - Takes an aggregate offline. You cannot take an aggregate offline if any of its volumes are online. The preferred command to take an aggregate offline is **storage aggregate offline**.
- restricted - Restricts the aggregate. You cannot restrict an aggregate if any of its volumes are online. The preferred command to restrict an aggregate is **storage aggregate restrict**.

**[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate**

This specifies whether the aggregate is considered by the Auto Balance Aggregate feature. If the

Auto Balance Aggregate feature is not used, this field is not used. When this parameter is set to **true** the Auto Balance Aggregate feature might recommend moving volumes to or from this aggregate in order to balance system workload. When this parameter is set to **false** the aggregate will not be considered as a destination for the Auto Balance Aggregate feature allowing for predictability in data placement. The default value is **false** .

#### **[-autobalance-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered Unbalanced (%)**

This parameter sets the space used threshold percentage that will cause the Auto Balance Aggregate feature to consider an aggregate as unbalanced.

#### **[-autobalance-available-threshold-percent <integer>] - Threshold When Aggregate Is Considered Balanced (%)**

This parameter sets the threshold percentage which will determine if an aggregate is a target destination for a move. The Auto Balance Aggregate feature will attempt to move volumes from an unbalanced aggregate until it is under this percentage.

#### **[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority**

This parameter specifies the new resynchronization priority value for the specified aggregate. This field cannot be modified for unmirrored or Data ONTAP system aggregates.

Possible values for this parameter are:

- high: Mirrored data aggregates with this priority value start resynchronization first.
- medium: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- low: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

#### **[-single-instance-data-logging {off|on}] - Enable SIDL**

This parameter specifies whether Single Instance Data Logging feature is enabled on the aggregate and the constituent volumes on the aggregate. This feature improves user write performance by optimizing the amount of data nlogged by user writes on platforms where NVRAM and secondary storage are of same media type.

#### **[-is-inactive-data-reporting-enabled {true|false}] - Inactive Data Reporting Enabled**

This parameter specified whether the reporting of how much user data is inactive should be enabled on the aggregate and volumes on the aggregate. This parameter is not allowed on FabricPools.

#### **[-encrypt-with-aggr-key {true|false}] - Enable Aggregate level Encryption**

This parameter specifies that the volumes within the new aggregate can be encrypted with aggregate keys. If this parameter is set to **true** , the aggregate will support encryption with aggregate keys.

**[-force-disable-encrypt-with-aggr-key <true>] - Force disable NAE. Skip aggregate snapshot check.**

This parameter allows disabling Aggregate Encryption (NAE) on an aggregate if the user is certain there is no aggregate snapshot for that aggregate containing NAE volumes. If the parameter is set to **true**, aggregate snapshot check is skipped and NAE is disabled.

**[-azcs-read-optimization {on|off}] - azcs read optimization**

This parameter specifies whether azcs read optimization is enabled on the aggregate. This feature improves read performance on cloud platforms.

## Examples

The following example changes all RAID groups on an aggregate named `aggr0` to use RAID-DP:

```
cluster1::> storage aggregate modify -aggregate aggr0 -raidtype raid_dp
```

The following example changes all RAID groups with FSAS disks in an aggregate named `aggr0` to use RAID-TEC:

```
cluster1::> storage aggregate modify -aggregate aggr0 -disktype FSAS -raidtype  
raid_tec
```

# storage aggregate offline

Offline an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate offline** command takes an aggregate offline.

If you are taking a root aggregate offline, the node owning the aggregate must be in maintenance mode.

## Parameters

**-aggregate <aggregate name> - Aggregate**

The name of the aggregate to be taken offline.

## Examples

The following example takes an aggregate named `aggr1` offline:

```
cluster1::> storage aggregate offline -aggregate aggr1
```

## storage aggregate online

Online an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate online** command brings an aggregate online if the aggregate is in offline or restricted state. If an aggregate is in an inconsistent state, it must be brought to a consistent state before it can be brought online. If you have an aggregate that is in an inconsistent state, contact Fujitsu support personnel.

### Parameters

**-aggregate <aggregate name> - Aggregate**

The name of the aggregate to be brought online.

### Examples

The following example brings an aggregate named aggr1 online:

```
cluster1::> storage aggregate online -aggregate aggr1
```

## storage aggregate remove-stale-record

Remove a stale aggregate record

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **storage aggregate remove-stale-record** command removes a stale storage aggregate record on disk. A stale aggregate record refers to an aggregate that has been removed from the storage system, but whose information remains recorded on disk. Stale aggregate records are displayed in the `nodeshell aggr status -r` command, but the `storage aggregate show` command does not show the aggregate as hosted on that node.

## Parameters

**-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate that corresponds to the stale aggregate record that is to be deleted.

**-nodename {<nodename>|local} - Node Name**

This parameter specifies the node that contains the aggregate.

## Examples

The following example removes a stale aggregate record that refers to aggregate "aggr1":

```
cluster1::> storage aggregate remove-stale-record -aggregate aggr1 -nodename node1
```

## storage aggregate rename

Rename an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate rename` command renames an aggregate.

## Parameters

**-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to be renamed.

**-newname <aggregate name> - New Name**

This parameter specifies the new name for the aggregate.

## Examples

The following example renames an aggregate named aggr5 as sales-aggr:

```
cluster1::> storage aggregate rename -aggregate aggr5 -newname sales-aggr
```

## storage aggregate restrict

Restrict an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate restrict** command puts an aggregate in restricted state to make data in the aggregate's volumes unavailable to clients. When an aggregate is in restricted state data access is not allowed. However, few operations such as aggregate copy, parity recomputation, scrub and RAID reconstruction are allowed. You can also use this command if you want the aggregate to be the target of an aggregate copy or SnapMirror replication operation.

## Parameters

**-aggregate <aggregate name> - Aggregate**

The name of the aggregate to be restricted.

## Examples

The following example restricts an aggregate named aggr1:

```
cluster1::> storage aggregate restrict -aggregate aggr1
```

# storage aggregate scrub

Aggregate parity scrubbing

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate scrub** command scrubs an aggregate for media and parity errors. Parity scrubbing compares the data disks to the parity disks in their RAID group and corrects the parity disks contents, as required. If no name is given, parity scrubbing is started on all online aggregates.

By default, scrubs are scheduled to run for a specified time on a weekly basis. However, you can use this command to run scrubs manually to check for errors and data inconsistencies.

## Parameters

**{ -aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to be scrubbed for errors.

**[-plex <text>] - Plex**

This parameter specifies the name of the plex to scrub. If this parameter is not specified, the

command scrubs the entire aggregate.

### **[-raidgroup <text>] - RAID Group**

This parameter specifies the RAID group to be scrubbed. If this parameter is not specified, the command scrubs the entire aggregate.

+

NOTE: This parameter is only applicable when the **-plex** parameter is used.

### **[-node {<nodename>|local} - Node }**

This parameter specifies the name of the node associated with the aggregate to be scrubbed. The value **local** specifies the current node.

### **-action {start|stop|resume|suspend|status} - Action**

This parameter specifies the action to be taken. The possible actions are:

- start - Starts a scrub.
- stop - Permanently stops a scrub. A stopped scrub cannot be resumed.
- resume - Resumes a suspended parity scrub.
- suspend - Suspends a parity scrub.
- status - Displays the current status of a scrub.

## Examples

The following example starts a scrub on a RAID group named rg0 of plex named plex0 on an aggregate named aggr0:

```
cluster1::> storage aggregate scrub -aggregate aggr0 -raidgroup rg0 -plex plex0
-action start
```

The following example queries the status of a scrub:

```
cluster1::> storage aggregate scrub -aggregate aggr0 -raidgroup rg0 -plex plex0
-action status
```

```
Raid Group:/aggr0/plex0/rg0, Is Suspended:false, Last Scrub:Sun Nov 13
01:30:55 2011
, Percentage Completed:7%
```

The following example starts a scrub on plex1 of an aggregate named aggr1:

```
cluster1::> storage aggregate scrub -aggregate aggr1 -plex plex1 -action start
```

The following example queries the status of plex1 of an aggregate named aggr1:

```
cluster1::> storage aggregate scrub -aggregate aggr1 -plex plex1 -action status

Raid Group:/aggr1/plex1/rg0, Is Suspended:false, Last Scrub:Sun Nov 13 02:07:29
2011
, Percentage Completed:1%
```

The following example queries the status of all the plexes for an aggregate named aggr1:

```
cluster1::> storage aggregate scrub -aggregate aggr1 -action status

Raid Group:/aggr1/plex0/rg0, Is Suspended:false, Last Scrub:Sun Nov 13 01:58:06
2011

Raid Group:/aggr1/plex1/rg0, Is Suspended:false, Last Scrub:Sun Nov 13 02:07:29
2011
, Percentage Completed:4%
```

## storage aggregate show-auto-provision-progress

Display aggregate auto provision status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate show-auto-provision-progress** command displays the status of the most recent auto provision operation. The command output displays the progress for all the aggregates included in the provisioning operation. The command displays the following information about each aggregate:

- Aggregate
- Current Usable Size
- Target Usable Size
- Provisioning Progress

### Examples

The following example displays the information about all aggregates that are provisioned during the aggregate auto provision operation:

```
cluster1::> aggr auto-provision
Node          New Data Aggregate          Usable Size
```

```

-----
node1          node1_SSD_1          23.65GB
node2          node2_SSD_1          23.65GB
-----
Total:         2    new data aggregates    47.30GB

```

Do you want to create recommended aggregates? {y|n}: y

Info: Aggregate auto provision has started. Use the "storage aggregate show-auto-provision-progress" command to track the progress.

```

cluster1::> storage aggregate show-auto-provision-progress

```

Aggregate	Current Usable Size	Target Usable Size	Provisioning Progress
node1_SSD_1	0B	23.65GB	Creating
node2_SSD_1	0B	23.65GB	Creating

```

-----
cluster1::> storage aggregate show-auto-provision-progress

```

Aggregate	Current Usable Size	Target Usable Size	Provisioning Progress
node1_SSD_1	23.65GB	23.65GB	Completed
node2_SSD_1	23.65GB	23.65GB	Completed

## storage aggregate show-cumulated-efficiency

Display cumulated storage efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate show-cumulated-efficiency** command displays information about the cumulated storage efficiency of all the aggregates. The storage efficiency is displayed at four different levels:

- Total
- Aggregate
- Volume
- Snapshot and FlexClone volume

### Parameters

```
{ [-fields <fieldname>, ...]
```

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the

specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[ -details ]**

Use this parameter to show additional Storage Efficiency Ratios.

### **[ -all-details ]**

Use this parameter to show additional Storage Efficiency Ratios and size values.

### **[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### **[ -aggregates <aggregate name>, ... ] - List of Aggregates to cumulate Storage Efficiency ratio**

If this parameter is specified, the command calculates the cumulated storage efficiency of the specified list of aggregates.

### **[ -nodes {<nodename>|local} ] - List of Aggregates to cumulate Storage Efficiency ratio**

If this parameter is specified, the command calculates the cumulated storage efficiency of aggregates that are located on the specified list of node.

### **[ -total-logical-used {<integer>[KB|MB|GB|TB|PB]} ] - Logical Size Used by volumes, clones, Snapshot copies in the Aggregate**

Displays the total logical size used in all the specified aggregates. This includes Volumes, Clones and Snapshots in all the specified aggregates. The logical size is computed based on physical usage and savings obtained in all the specified aggregates.

### **[ -total-physical-used {<integer>[KB|MB|GB|TB|PB]} ] - Total Physical Used**

Displays the physical size used by all the specified aggregates.

### **[ -total-storage-efficiency-ratio <text> ] - Total Storage Efficiency Ratio**

Displays the total storage efficiency ratio of the aggregate.

### **[ -total-data-reduction-logical-used-wo-snapshots {<integer>[KB|MB|GB|TB|PB]} ] - Total Data Reduction Logical Used Without Snapshots**

Displays the total logical size used in all the specified aggregates excluding Snapshot copies.

### **[ -total-data-reduction-physical-used-wo-snapshots {<integer>[KB|MB|GB|TB|PB]} ] - Total Data Reduction Physical Used Without Snapshots**

Displays the total physical size used by all the specified aggregates excluding Snapshot copies.

### **[ -total-data-reduction-efficiency-ratio-wo-snapshots <text> ] - Total Data Reduction Efficiency Ratio Without Snapshots**

Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction, Pattern Detection and FlexClone data reduction technologies excluding snapshot copies on the specified aggregates.

**[-total-data-reduction-logical-used-wo-snapshots-flexclones {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Logical Used without snapshots and flexclones**

Displays the total logical size used in all the specified aggregates excluding Snapshot copies and FlexClones.

**[-total-data-reduction-physical-used-wo-snapshots-flexclones {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used without snapshots and flexclones**

Displays the total physical size used by all the specified aggregates aggregates excluding Snapshot copies and FlexClones.

**[-total-data-reduction-efficiency-ratio-wo-snapshots-flexclones <text>] - Total Data Reduction Efficiency Ratio without snapshots and flexclones**

Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction, Pattern Detection data reduction technologies excluding snapshot copies on the specified aggregates.

**[-total-performance-tier-data-reduction-physical-used-wo-snapshots-flexclones {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used without snapshots and flexclones in the FabricPool Performance Tier**

Displays the total performance tier physical size used by all the specified aggregates aggregates excluding Snapshot copies and FlexClones.

**[-volume-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Space Used for All volumes**

Displays the total logical size used by all the volumes in all the specified aggregates.

**[-volume-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Space Used for All volumes**

Displays the total physical size used by all volumes in all the specified aggregates.

**[-volume-dedupe-zero-pattern-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by volume Deduplication and pattern detection**

Displays the total disk space that is saved by deduplication, Zero pattern detection and FlexClone for files, LUNs or NVMe namespaces by all volumes in all the specified aggregates.

**[-volume-efficiency-saved-ratio <text>] - Volume Deduplication Savings ratio**

Displays the storage efficiency ratio for savings by deduplication and FlexClone for files, LUNs or NVMe namespaces by all volumes in all the specified aggregates.

**[-volume-compression-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by volume Compression**

Displays the total disk space that is saved by compressing blocks by all volumes in all the specified aggregates.

**[-volume-compression-saved-ratio <text>] - Volume Compression Savings ratio**

Displays the storage efficiency ratio for savings by compressing blocks on all volumes in all the specified aggregates.

**[-volume-data-reduction-storage-efficiency-ratio <text>] - Volume Data Reduction SE Ratio**

Displays the storage efficiency ratio of all the volumes in all the specified aggregates.

**[-aggr-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Space Used by the Aggregate**

Displays the logical size used by all the specified aggregates.

**[-aggr-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Space Used by the Aggregate**

Displays the physical size used by all the specified aggregates.

**[-aggr-data-reduction-storage-efficiency-ratio <text>] - Aggregate Data Reduction SE Ratio**

Displays the storage efficiency ratio of the aggregate.

**[-snapshot-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by Snapshot copies**

Displays the logical size used by all Volume Snapshots residing in all the specified aggregates.

**[-snapshot-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Size Used by Snapshot copies**

Displays the physical size used by all Volume Snapshots residing in all the specified aggregates.

**[-snapshot-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot volume Data Reduction Ratio**

Displays the Snapshot volume storage efficiency ratio of the aggregate.

**[-flexclone-volume-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by FlexClone volumes**

Displays the logical size used by all FlexClone volumes residing in all the specified aggregates.

**[-flexclone-volume-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Sized Used by FlexClone volumes**

Displays the physical size used by all FlexClone volumes in all the specified aggregates.

**[-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - FlexClone volume Data Reduction Ratio**

Displays the FlexClone volume storage efficiency ratio of the aggregate.

**[-snapshot-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot And FlexClone volume Data Reduction SE Ratio**

Displays the Snapshot and FlexClone volume storage efficiency ratio of the aggregate.

**[-number-of-offline-volumes <integer>] - Number of volumes Offline**

Displays the number of volumes that are offline in all the specified aggregates.

**[-number-of-sis-disabled-volumes <integer>] - Number of SIS Disabled volumes**

Displays the number of volumes on which volume efficiency is disabled in all the specified aggregates.

**[-number-of-sis-change-log-disabled-volumes <integer>] - Number of SIS Change Log Disabled volumes**

Displays the number of volumes on which efficiency change log is disabled in all the specified aggregates. The scheduled background Deduplication will be disabled on these volumes.

**[-number-of-skipped-aggregates <integer>] - Number of Skipped Aggregates**

Displays the number of aggregates that were skipped for calculating the cumulated storage efficiency.

**[-skipped-aggregates <aggregate name>,...] - List of Aggregates skipped**

Displays the list of aggregates that were skipped for calculating the cumulated storage efficiency.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster::> aggr show-cumulated-efficiency
Total Data Reduction Efficiency Ratio: 5.00:1
Total Storage Efficiency Ratio: 6.97:1

## storage aggregate show-efficiency

Display aggregate storage efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate show-efficiency** command displays information about the storage efficiency of all the aggregates. The storage efficiency is displayed at four different levels:

- Total
- Aggregate
- Volume
- Snapshot and FlexClone volume

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -details ]**

Use this parameter to show additional Storage Efficiency Ratios.

**[ -advanced ]**

Use this parameter to show additional Storage Efficiency Ratios and size values.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Name of the Aggregate**

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

**[-node {<nodename>|local}] - Node where Aggregate Resides**

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

**[-total-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by Volumes, Clones, Snapshot Copies in the Aggregate**

Displays the logical size used in the aggregate. This includes Volumes, Clones and Snapshots in the aggregate. The logical size is computed based on physical usage and savings obtained in the aggregate.

**[-total-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used**

Displays the physical size used by the aggregate.

**[-total-storage-efficiency-ratio <text>] - Total Storage Efficiency Ratio**

Displays the total storage efficiency ratio of the aggregate.

**[-total-data-reduction-logical-used-wo-snapshots {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Logical Used Without Snapshots**

Displays the logical size used in the aggregate excluding Snapshot copies.

**[-total-data-reduction-physical-used-wo-snapshots {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used Without Snapshots**

Displays the physical size used by the aggregate excluding Snapshot copies.

**[-total-data-reduction-efficiency-ratio-wo-snapshots <text>] - Total Data Reduction Efficiency Ratio Without Snapshots**

Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data

Compaction, Pattern Detection and FlexClone data reduction technologies excluding snapshot copies on the aggregate.

**[-total-data-reduction-logical-used-wo-snapshots-flexclones {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Logical Used without snapshots and flexclones**

Displays the logical size used in the aggregate excluding Snapshot copies and FlexClones.

**[-total-data-reduction-physical-used-wo-snapshots-flexclones {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used without snapshots and flexclones**

Displays the physical size used by the aggregate excluding Snapshot copies and FlexClones.

**[-total-data-reduction-efficiency-ratio-wo-snapshots-flexclones <text>] - Total Data Reduction Efficiency Ratio without snapshots and flexclones**

Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction, Pattern Detection data reduction technologies excluding snapshot copies and flexclones on the aggregate.

**[-volume-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Space Used for All Volumes**

Displays the logical size used by all the volumes in the aggregate.

**[-volume-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Space Used for All Volumes**

Displays the physical size used by all volumes in the aggregate.

**[-volume-efficiency-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Volume Deduplication**

Displays the total disk space that is saved by deduplication and FlexClone for files, LUNs or NVMe namespaces by all volumes in the aggregate.

**[-volume-dedupe-zero-pattern-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Volume Deduplication and pattern detection**

Displays the total disk space that is saved by deduplication, Zero pattern detection and FlexClone for files, LUNs or NVMe namespaces by all volumes in the aggregate.

**[-volume-efficiency-saved-ratio <text>] - Volume Deduplication Savings ratio**

Displays the storage efficiency ratio for savings by deduplication and FlexClone for files, LUNs or NVMe namespaces by all volumes in the aggregate.

**[-volume-compression-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Volume Compression**

Displays the total disk space that is saved by compressing blocks by all volumes in the aggregate.

**[-volume-compression-saved-ratio <text>] - Volume Compression Savings ratio**

Displays the storage efficiency ratio for savings by compressing blocks on all volumes in the aggregate.

**[-volume-vbn-zero-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Inline Zero Pattern Detection**

Displays the total disk space that is saved by inline zero pattern detection by all the volumes in the aggregate.

**[-volume-data-reduction-storage-efficiency-ratio <text>] - Volume Data Reduction SE Ratio**

Displays the storage efficiency ratio of all the volumes in the aggregate.

**[-aggr-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Space Used by the Aggregate**

Displays the logical size used by the aggregate.

**[-aggr-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Space Used by the Aggregate**

Displays the physical size used by the aggregate.

**[-aggr-compaction-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Aggregate Data Reduction**

Displays the total disk space that is saved by data compaction, cross volume sharing at the aggregate level.

**[-aggr-data-reduction-storage-efficiency-ratio <text>] - Aggregate Data Reduction SE Ratio**

Displays the storage efficiency ratio of the aggregate.

**[-snapshot-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by Snapshot Copies**

Displays the logical size used by all Volume Snapshots residing in the aggregate.

**[-snapshot-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Size Used by Snapshot Copies**

Displays the physical size used by all Volume Snapshots residing in the aggregate.

**[-snapshot-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot Volume Data Reduction Ratio**

Displays the Snapshot volume storage efficiency ratio of the aggregate.

**[-flexclone-volume-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by FlexClone Volumes**

Displays the logical size used by all FlexClone volumes residing in the aggregate.

**[-flexclone-volume-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Sized Used by FlexClone Volumes**

Displays the physical size used by all FlexClone volumes in the aggregate.

**[-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - FlexClone Volume Data Reduction Ratio**

Displays the FlexClone volume storage efficiency ratio of the aggregate.

**[-snapshot-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot And FlexClone Volume Data Reduction SE Ratio**

Displays the Snapshot and FlexClone volume storage efficiency ratio of the aggregate.

**[-number-of-offline-volumes <integer>] - Number of Volumes Offline**

Displays the number of volumes that are offline in the aggregate.

**[-number-of-sis-disabled-volumes <integer>] - Number of SIS Disabled Volumes**

Displays the number of volumes on which volume efficiency is disabled in the aggregate.

## **[-number-of-sis-change-log-disabled-volumes <integer>] - Number of SIS Change Log Disabled Volumes**

Displays the number of volumes on which efficiency change log is disabled in the aggregate. The scheduled background Deduplication will be disabled on these volumes.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster::*> aggr show-efficiency

Aggregate: aggr1
Node: node1

Total Data Reduction Efficiency Ratio: 3.29:1
Total Storage Efficiency Ratio:      4.29:1
Aggregate: aggr2
Node: node1

Total Data Reduction Efficiency Ratio: 4.50:1
Total Storage Efficiency Ratio:      5.49:1

cluster::*> aggr show-efficiency -details

Aggregate: aggr1
Node: node1

Total Data Reduction Ratio:          2.39:1
Total Storage Efficiency Ratio:      4.29:1

Aggregate level Storage Efficiency
(Aggregate Deduplication and Data Compaction): 1.00:1
Volume Deduplication Efficiency:      5.03:1
Compression Efficiency:               1.00:1

Snapshot Volume Storage Efficiency:    8.81:1
FlexClone Volume Storage Efficiency:   1.00:1
Number of Efficiency Disabled Volumes: 1

Aggregate: aggr2
Node: node1

Total Data Reduction Ratio:          2.39:1
Total Storage Efficiency Ratio:      4.29:1

Aggregate level Storage Efficiency
(Aggregate Deduplication and Data Compaction): 1.00:1
Volume Deduplication Efficiency:      5.03:1
Compression Efficiency:               1.00:1
```

Snapshot Volume Storage Efficiency:	8.81:1
FlexClone Volume Storage Efficiency:	1.00:1
Number of Efficiency Disabled Volumes:	1

## storage aggregate show-resync-status

Display aggregate resynchronization status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate show-resync-status** command displays resync status information for each plex. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all aggregates:

- Aggregate Name
- Resyncing Plex Name
- Resyncing Percentage

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

This parameter specifies the name of the aggregate.

**[-plex <text>] - Plex Name**

This parameter specifies the name of the plex.

**[-status <text>] - Status**

Displays plex status. Possible values are:

- **normal**
- **failed**
- **empty**
- **invalid**

- **uninitialized**
- **failed assimilation**
- **limbo**
- **active**
- **inactive**
- **resyncing**

These values may appear by themselves or in combination separated by commas; for example, "normal,active".

#### **[-is-online {true|false}] - Is Online**

Indicates whether the plex is online.

#### **[-in-progress {true|false}] - Resync is in Progress**

Indicates whether the plex is currently resyncing.

#### **[-resyncing-percent <percent>] - Resyncing Percentage**

Displays the resynchronization completion percentage if the plex is currently being resynced, '-' otherwise.

#### **[-resync-level <integer>] - Resync Level**

Displays the resync level if the plex is currently being resynced, '-' otherwise.

#### **[-pool <integer>] - Pool**

The pool number to which the majority of disks in the plex belong.

## Examples

The following example displays resynchronization status for all the aggregates:

```
cluster1::> storage aggregate show-resync-status
Aggregate Resyncing Plex          Complete
-----
aggr0      plex0                      -
aggr1      plex0                      -
aggr1      plex1                      10.00
aggr2      plex0                      -
aggr2      plex2                      -
5 entries were displayed.
```

## storage aggregate show-scrub-status

Display aggregate scrubbing status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate show-scrub-status** command displays the following information about the scrub status of aggregates:

- Aggregate name
- RAID groups
- Whether the scrub is suspended
- Percentage of the scrub that is completed
- Last scrub time of the aggregate

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -aggregate <aggregate name> ] - Aggregate**

If this parameter is specified, the command displays detailed scrub-status information about the specified aggregate.

**[ -raidgroup <text> ] - RAID Group**

If this parameter is specified, the command displays information only about the aggregate that contains the specified RAID group.

**[ -node {<nodename>|local} ] - Node**

If this parameter is specified, the command displays information only about the aggregates on the specified node. The value **local** specifies the current node.

**[ -suspended {true|false} ] - Is Suspended**

If this parameter is specified, the command displays information only about the aggregates that have the specified scrub-suspension state (true or false).

**[ -complete-percentage <percent> ] - Percentage Completed**

If this parameter is specified, the command displays information only about the aggregates whose scrubs have the specified completed percentage.

**[ -last-scrub-time <MM/DD/YYYY HH:MM:SS> ] - Last Scrub Time**

If this parameter is specified, the command displays information only about the aggregates that

have the specified last-scrub time, in the format **MM/DD/YYYY HH:MM:SS** .

## Examples

The following example displays scrub-status information for all the aggregates:

```
cluster1::> storage aggregate show-scrub-status
Aggregate RAID Groups          Suspended  Percentage Last Scrub Time
-----
aggr0    /aggr0/plex0/rg0    true           0% 3/31/2011  21:23:02
aggr1    /aggr1/plex0/rg1    true           45% 3/30/2011  01:05:00

4 entries were displayed.
```

The following example displays detailed information about the aggregate named aggr1:

```
cluster1::> storage aggregate show-scrub-status -instance -aggregate aggr1
Aggregate: aggr1
RAID Group: /aggr1/plex0/rg0
Is Suspended: false
Percentage Completed: 2%
Last Scrub Time: 3/31/2011 22:02:50
```

## storage aggregate show-space

Display details of space utilization within an aggregate.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate show-space** command displays information about space utilization within aggregates and any attached external capacity tier. The command output breaks down space usage in the specified aggregate by feature. If no parameters are specified, the command displays this information about all aggregates. Note that used percentage for an external capacity tier will be non-zero only if a size limit was set for that aggregate's attached tier.

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[`-instance`] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-aggregate-name <aggregate name>`] - Aggregate**

If this parameter is specified, the command displays information only about the specified aggregates.

**[`-bin-num <integer>`] - Bin Number**

If this parameter is specified, the command displays information only about the aggregates whose bin number for the storage tier matches the specified value. Typically, bin 0 refers to the performance tier or active file system and bin numbers greater than 0 refer to the external capacity tiers attached to the aggregate.

**[`-tier-name <text>`] - Tier Name For Show Command**

If this parameter is specified, the command displays information only about the aggregates whose attached storage tier name matches the specified value.

**[`-aggregate <aggregate name>`] - Aggregate Display Name**

If this parameter is specified, the command displays information only about space used in the specified aggregate or aggregates.

**[`-aggregate-uuid <UUID>`] - Uuid of the Aggregate**

If this parameter is specified, the command displays information only about the aggregates whose UUID matches the specified value.

**[`-volume-footprints {<integer>[KB|MB|GB|TB|PB]}`] - Volume Footprints**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by volume footprints. A volume's footprint is the overall amount of space that a volume occupies in the aggregate, including the volume metadata and data.

**[`-volume-footprints-percent <percent_no_limit>`] - Volume Footprints Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates whose volume footprints occupy the specified percentage of space.

**[`-snap-size-total {<integer>[KB|MB|GB|TB|PB]}`] - Total Space for Snapshot Copies in Bytes**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by aggregate Snapshot copies. This field includes the space that is reserved for Snapshot copies and is not available to volumes or aggregate data and metadata. It is set to 0 by default.

**[`-percent-snapshot-space <percent>`] - Space Reserved for Snapshot Copies**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by aggregate Snapshot copies.

**[-aggregate-metadata {<integer>[KB|MB|GB|TB|PB]}] - Aggregate Metadata**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by aggregate metadata.

**[-aggregate-metadata-percent <percent\_no\_limit>] - Aggregate Metadata Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by aggregate metadata.

**[-used-including-snapshot-reserve {<integer>[KB|MB|GB|TB|PB]}] - Total Used**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use in the aggregate.

It is important to note that this parameter treats the entire Snapshot reserve as used space since it is not available for volumes.

**[-used-including-snapshot-reserve-percent <percent\_no\_limit>] - Total Used Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use in the aggregate and its Snapshot reserve.

**[-aggregate-size {<integer>[KB|MB|GB|TB|PB]}] - Size**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified size.

**[-snapshot-reserve-unusable {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Reserve Unusable**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space reserved but unusable in the volume.

Snapshot reserve can be diminished under certain conditions to accommodate volume metadata. Creating space in the aggregate will make this space available.

**[-snapshot-reserve-unusable-percent <percent\_no\_limit>] - Snapshot Reserve Unusable Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space reserved but unusable.

**[-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used Size**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of physical space in use by the aggregate.

This differs from **total-used** space by the space that is guaranteed for future writes. The value includes blocks in use by Snapshot copies.

**[-physical-used-percent <percent\_no\_limit>] - Physical Used Percentage**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of physical space in use in the aggregates.

**[-performance-tier-inactive-user-data {<integer>[KB|MB|GB|TB|PB]}] - Performance Tier Inactive User Data**

If this parameter is specified, the command displays information only about the aggregates whose amount of inactive user data in the performance tier matches the specified value. The inactive user data can be tiered out to a capacity tier if the aggregate is a FabricPool.

**[-performance-tier-inactive-user-data-percent <percent>] - Performance Tier Inactive User Data Percent**

If this parameter is specified, the command displays information only about the aggregates whose percentage of inactive user data in the performance tier matches the specified value.

**[-cross-volume-dedupe-metadata {<integer>[KB|MB|GB|TB|PB]}] - Aggregate Dedupe Metadata**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by cross volume deduplication metadata.

**[-cross-volume-dedupe-metadata-percent <percent\_no\_limit>] - Aggregate Dedupe Metadata Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by cross volume deduplication metadata.

**[-cross-volume-dedupe-temp-metadata {<integer>[KB|MB|GB|TB|PB]}] - Aggregate Dedupe Temporary Metadata**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by cross volume deduplication temporary metadata.

**[-cross-volume-dedupe-temp-metadata-percent <percent\_no\_limit>] - Aggregate Dedupe Temporary Metadata Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by cross volume deduplication temporary metadata.

**[-total-provisioned-space {<integer>[KB|MB|GB|TB|PB]}] - Total Space Provisioned inside Aggregate**

If this parameter is specified, the command displays information about the total provisioned space across all the volumes in the aggr.

**[-total-provisioned-space-percent <percent\_no\_limit>] - Percentage Space Provisioned inside Aggregate**

If this parameter is specified, the command displays information about the percentage of total provisioned space across all the volumes against aggr's size.

**[-object-store-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used Size**

If this parameter is specified, the command displays information only about the aggregates whose physical space use in the attached object store matches the specified value.

**[-object-store-physical-used-percent <percent\_no\_limit>] - Physical Used Percentage**

If this parameter is specified, the command displays information only about aggregates whose physical space in use in the attached object store as a percentage of the license limit matches the specified value.

**[-object-store-referenced-capacity {<integer>[KB|MB|GB|TB|PB]}] - Total Object Store Logical Referenced Capacity**

If this parameter is specified, the command displays information only about the aggregates whose logical reference capacity space in use in the attached object store matches the specified value.

**[-object-store-referenced-capacity-percent <percent\_no\_limit>] - Object Store Logical Referenced Capacity Percentage**

If this parameter is specified, the command displays information only about aggregates whose logical reference capacity space in use in the attached object store as a percentage of the license limit matches the specified value.

**[-object-store-metadata {<integer>[KB|MB|GB|TB|PB]}] - (DEPRECATED)-Object Store Metadata**

This parameter is deprecated in Data ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about the aggregates whose metadata space in use in the attached object store matches the specified value.

**[-object-store-metadata-percent <percent\_no\_limit>] - (DEPRECATED)-Object Store Metadata Percent**

This parameter is deprecated in Data ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about aggregates whose metadata space in use in the attached object store as a percentage of the license limit matches the specified value.

**[-object-store-unreclaimed-space {<integer>[KB|MB|GB|TB|PB]}] - (DEPRECATED)-Total Unreclaimed Space**

This parameter is deprecated in Data ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about the aggregates whose unreclaimed space in use in the attached object store matches the specified value.

**[-object-store-unreclaimed-space-percent <percent\_no\_limit>] - (DEPRECATED)-Object Store Unreclaimed Space Percentage**

This parameter is deprecated in Data ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about aggregates whose unreclaimed space in use in the attached object store as a percentage of the license limit matches the specified value.

**[-object-store-size {<integer>[KB|MB|GB|TB|PB]}] - Object Store Size**

If this parameter is specified, the command displays information only about the aggregates whose attached object store size limit matches the specified value.

**[-object-store-sis-space-saved {<integer>[KB|MB|GB|TB|PB]}] - Object Store Space Saved by Storage Efficiency**

If this parameter is specified, the command displays information only about the aggregates

whose amount of space saved by storage efficiency matches the specified value.

### **[-object-store-sis-space-saved-percent <percent\_no\_limit>] - Object Store Space Saved by Storage Efficiency Percentage**

If this parameter is specified, the command displays information only about the aggregates whose percentage of space saved by storage efficiency matches the specified value.

### **[-object-store-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Logical Used Size**

If this parameter is specified, the command displays information only about the aggregates whose logical space use in the attached object store matches the specified value.

### **[-object-store-logical-used-percent <percent\_no\_limit>] - Logical Used Percentage**

If this parameter is specified, the command displays information only about aggregates whose logical space in use in the attached object store as a percentage of the license limit matches the specified value.

### **[-object-store-logical-unreferenced-capacity {<integer>[KB|MB|GB|TB|PB]}] - Logical Unreferenced Capacity**

If this parameter is specified, the command displays information only about the aggregates whose logical unreferenced capacity in use in the attached object store matches the specified value.

### **[-object-store-logical-unreferenced-capacity-percent <percent\_no\_limit>] - Logical Unreferenced Percentage**

This parameter is deprecated in Data ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about aggregates whose logical unreferenced capacity in use in the attached object store as a percentage of the license limit matches the specified value.

## Examples

The following example displays information about all aggregates:

```
cluster1::> storage aggregate show-space
Aggregate : aggr0
Feature                                     Used      Used%
-----
Volume Footprints                          5.75GB    91%
Aggregate Metadata                          380KB     0%
Snapshot Reserve                           325.3MB   5%
Total Used                                  6.07GB    96%
Total Physical Used                          221.9MB   3%
Aggregate : aggr1
Feature                                     Used      Used%
-----
Volume Footprints                          2.03GB    33%
Aggregate Metadata                          304KB     0%
Total Used                                  2.03GB    33%
Total Physical Used                          2.23MB    0%
```

2 entries were displayed.

The following example displays information about all the aggregates in a system including the ones that have an object store attached to them.

```

cluster-1::> storage aggregate show-space
Aggregate : aggr0
Feature                                Used      Used%
-----

## storage aggregate show-spare-disks

Display spare disks

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The command **storage aggregate show-spare-disks** displays information about spare disks. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all spare disks in the cluster.

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-partition-info ]**

Displays the following information about root-data and root-data1-data2 partitioned spares.

- Disk
- Type
- Class
- RPM
- Checksum
- Local Data Usable
- Local Data1 Usable
- Local Data2 Usable
- Local Root Usable
- Physical Size
- Status

**[ [-instance ] }**

If this parameter is specified, the command displays detailed information about each spare disk.

**[-original-owner <text>] - Original Owner**

Selects the spare disks that match this parameter value.

**[-disk <disk path name>] - Disk Name**

Selects the spare disks that match this parameter value.

**[-checksum-style {advanced\_zoned | block | none}] - Checksum Style**

Selects the spare disks that match this parameter value. Possible values are:

- block — Supports block checksum
- advanced\_zoned — Supports advanced zone checksum
- none — No checksum support

**[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

Selects the spare disks that match this parameter value.

**[-effective-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Effective Disk Type**

Selects the spare disks that match this parameter value.

Hard disk drives with the same **effective-disk-type** value may be mixed together in the same aggregate depending upon the system's **raid.mix.hdd.disktype.capacity** and **raid.mix.hdd.disktype.performance** option settings. Solid state drives with the same **effective-disk-type** value may be mixed together in the same aggregate depending upon the system's **raid.mix.disktype.solid\_state** option setting.

**[-standard-disk-type {SATA | FC | NL-SAS | LUN | SAS | SCSI | SSD | VM-DISK | NVMe-SSD | SSD-CAP | SSD-ZNS | VM-LUN | VM-LUN-SSDS}] - Standard Disk Type**

Selects the spare disks that match this parameter value.

**[-disk-class {capacity | performance | archive | solid-state | array | virtual}] - Disk Class**

Selects the spare disks that match this parameter value. Possible values are:

- capacity — Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- performance — Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- archive — Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- solid-state — Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM.
- array — Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- virtual — Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

Disks with the same **disk-class** value are compatible for use in the same aggregate.

**[-disk-rpm <integer>] - Disk RPM**

Selects the spare disks that match this parameter value.

**[-effective-disk-rpm <integer>] - Effective Disk RPM**

Selects the spare disks that match this parameter value.

Hard disk drives with the same **effective-disk-rpm** value may be mixed together in the same aggregate depending upon the system's **raid.mix.hdd.rpm.capacity** and **raid.mix.hdd.rpm.performance** option settings.

**[-syncmirror-pool <text>] - Pool Number**

Selects the spare disks that match this parameter value.

**[-owner-name {<nodename>|local}] - Current Owner**

Selects the spare disks that match this parameter value.

**[-home-owner-name {<nodename>|local}] - Home Owner**

Selects the spare disks that match this parameter value.

**[-dr-owner-name {<nodename>|local}] - DR Home Owner**

Selects the spare disks that match this parameter value.

**[-usable-size-blks <integer>] - Disk Usable Size in 4K blocks**

Selects the spare disks that match this parameter value.

**[-local-usable-data-size-blks <integer>] - Local Node Data Usable Size in 4K blocks**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data partition size (of root-data partitioned disk) or the combined data1 + data2 partition size (of root-data1-data2 partitioned disk) in 4KB blocks.

**[-local-usable-root-size-blks <integer>] - Local Node Root Usable Size in 4K blocks**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the root partition size in 4KB blocks.

**[-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Usable Size**

Selects the spare disks that match this parameter value.

**[-total-size {<integer>[KB|MB|GB|TB|PB]}] - Total Size**

Selects the spare disks that match this parameter value.

**[-local-usable-data-size {<integer>[KB|MB|GB|TB|PB]}] - Local Node Data Usable Size**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data partition size (of root-data partitioned disk) or the combined data1 + data2 partition size (of root-data1-data2 partitioned disk) in auto-scaled units.

**[-local-usable-root-size {<integer>[KB|MB|GB|TB|PB]}] - Local Node Root Usable Size**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the root partition size in auto-scaled units.

**[-is-disk-zeroed {true|false}] - Is Disk Zeroed?**

Selects the spare disks that match this parameter value.

When disks are zeroed, they can be provisioned directly into aggregates which avoids a lengthy zeroing process.

**[-is-disk-zeroing {true|false}] - Is Disk Zeroing?**

Selects the spare disks that match this parameter value.

**[-zeroing-percent <percent>] - Zeroing Percentage Completed**

Selects the spare disks that match this parameter value.

**[-is-sparecore {true|false}] - Sparecore Disk?**

Selects the spare disks that match this parameter value.

**[-sparecore-status <Spare core status>] - Sparecore Status**

Selects the spare disks that match this parameter value.

**[-sparecore-percent <percent>] - Sparecore Percentage Completed**

Selects the spare disks that match this parameter value.

**[-is-disk-shared {true|false}] - Is Disk Shared?**

Selects the spare disks that match this parameter value.

Shared disks have partitions that allow them to be used in multiple aggregates and between nodes in an HA pair. When set to **true**, this parameter selects shared disks in which the root partition and/or the data partition is a spare. When set to **false** only spare disks without partitions are displayed. When this parameter is not used, all spare disks are displayed.

**[-is-disk-offline {true|false}] - Is Disk Offline?**

Selects the spare disks that match this parameter value.

Disk offline events are typically temporary events which allow Data ONTAP to perform background error recovery activity.

**[-is-disk-sick {true|false}] - Is Disk Sick?**

Selects the spare disks that match this parameter value.

A sick disk triggers Rapid RAID Recovery to copy data to a spare drive. At the end of the process the sick disk is marked as **broken**.

**[-is-disk-left-behind {true|false}] - Is Disk Left Behind Spare?**

Selects the spare disks that match this parameter value.

Disks are left behind if they are not responding during a giveback or switchback event.

**[-local-usable-data1-size-blks <integer>] - Local Node Data1 Usable Size in 4K blocks**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data1 partition size of a root-data1-data2 partitioned disk in 4KB blocks.

#### **[-local-usable-data2-size-blks <integer>] - Local Node Data2 Usable Size in 4K blocks**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data2 partition size of a root-data1-data2 partitioned disk in 4KB blocks.

#### **[-local-usable-data1-size {<integer>[KB|MB|GB|TB|PB]}] - Local Node Data1 Usable Size**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data1 partition size of a root-data1-data2 partitioned disk in auto-scaled units.

#### **[-local-usable-data2-size {<integer>[KB|MB|GB|TB|PB]}] - Local Node Data2 Usable Size**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data2 partition size of a root-data1-data2 partitioned disk in auto-scaled units.

## Examples

Display spare disks owned by node **node-b**.

```
cluster1::> storage aggregate show-spare-disks -owner-name node-b
```

```
Original Owner: node-b
```

```
Pool0
```

```
Spare Pool
```

```
Usable Physical
```

Disk	Type	Class	RPM	Checksum	Size	Size	Status
------	------	-------	-----	----------	------	------	--------

```

-----
1.1.13          BSAS capacity 7200 block          827.7GB 828.0GB zeroed
1.1.15          BSAS capacity 7200 block          413.2GB 414.0GB zeroed

Original Owner: node-b
Pool0
Partitioned Spares

Disk Status          Type Class          RPM Checksum          Local Data Usable          Local Root Usable          Physical Size
-----
1.0.8             SAS performance 10000 block          472.9GB 73.89GB 547.1GB
zeroed

```

Check on the progress of a previous disk zeroing command.

```

cluster1::> storage aggregate show-spare-disks -owner-name node-b -zeroing-percent >0

Original Owner: node-b
Pool0
Spare Pool
Usable Physical
Disk Status          Type Class          RPM Checksum          Size          Size Status
-----
1.1.13             BSAS capacity 7200 block          827.7GB 828.0GB zeroing,
17% done
1.1.15             BSAS capacity 7200 block          413.2GB 414.0GB zeroing,
28% done
2 entries were displayed.

```

## storage aggregate show-status

Display aggregate configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate show-status** command displays the RAID layout and disk configuration of aggregates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all aggregates in the cluster.

This command does not use pagination. You can reduce the output by filtering with the parameters below.

## Parameters

{[-fields <fieldname>,...]}

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{[-instance ]}

This parameter currently has no effect.

**[-aggregate <text>] - Aggregate Name**

Selects the aggregates that match this parameter value.

**[-node <nodename>] - Node**

Selects the aggregates that match this parameter value.

**[-aggregate-uuid <UUID>] - Aggregate UUID**

Selects the aggregates that match this parameter value.

## Examples

Display the RAID layout of a Flash Pool aggregate.

```
cluster1::> storage aggregate show-status -aggregate nodeB_flashpool_1
```

```
Owner Node: node-b
```

```
Aggregate: nodeB_flashpool_1 (online, raid_dp, hybrid) (block checksums)
```

```
Plex: /nodeB_flashpool_1/plex0 (online, normal, active, pool0)
```

```
RAID Group /nodeB_flashpool_1/plex0/rg0 (normal, block checksums)
```

Position	Disk	Pool	Type	RPM	Usable Size	Physical Size	Status
dparity	1.1.7	0	BSAS	7200	827.7GB	828.0GB	(normal)
parity	1.1.8	0	BSAS	7200	827.7GB	828.0GB	(normal)
data	1.1.10	0	BSAS	7200	827.7GB	828.0GB	(normal)
data	1.1.11	0	BSAS	7200	827.7GB	828.0GB	(normal)
data	1.1.12	0	BSAS	7200	827.7GB	828.0GB	(normal)

```
RAID Group /nodeB_flashpool_1/plex0/rg1 (normal, block checksums) (Storage Pool: SP2)
```

Position	Disk	Pool	Type	RPM	Usable Size	Physical Size	Status
shared	1.0.22	0	SSD	-	186.2GB	745.2GB	(normal)
shared	1.0.20	0	SSD	-	186.2GB	745.2GB	(normal)
shared	1.0.18	0	SSD	-	186.2GB	745.2GB	(normal)
shared	1.0.16	0	SSD	-	186.2GB	745.2GB	(normal)

# storage aggregate show

Display a list of aggregates

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate show** command displays information about aggregates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all aggregates:

- Aggregate name
- Size
- Available size
- Percentage used
- State
- Number of volumes
- Node on which the aggregate is located
- RAID status

To display detailed information about a single aggregate, use the **-aggregate** parameter.

## Parameters

### { [-fields <fieldname>, ... ]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### [ [-checksum ]

If this parameter is specified, the command displays information about the checksum for all aggregates in the cluster:

- Aggregate name
- Checksum status (active, off, reverting, none, unknown, initializing, reinitializing, reinitialized, upgrading\_phase1, upgrading\_phase2)
- Checksum style (none, advanced\_zoned, block, mixed, WAFL, or unknown)

### [ [-disk ]

If this parameter is specified, the command displays disk names for all aggregates in the cluster:

- Aggregate name
- Number and names of disks in the aggregate

**[`-raid-info`] ]**

If this parameter is specified, the command displays information about RAID groups, RAID type, maximum RAID size, checksum state, checksum style and whether the RAID status is inconsistent.

**[`-instance`] }**

If this parameter is specified, the command displays detailed information about all aggregates in the cluster.

**[`-aggregate <aggregate name>`] - Aggregate**

If this parameter is specified, the command displays detailed information about the specified aggregate.

**[`-storage-type {hdd | hybrid | lun | ssd | vmdisk}`] - Storage Type**

If this parameter is specified, the command displays information only about the aggregates with the specified storage type. The possible values are hdd, hybrid, lun, ssd and vmdisk.

**[`-checksumstyle <aggrChecksumStyle>`] - Checksum Style**

If this parameter is specified, the command displays information only about the aggregates that use the specified checksum style.

**[`-diskcount <integer>`] - Number Of Disks**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of disks.

**[`-m, -mirror <true>`] - Is Mirrored**

If this parameter is specified, the command displays information only about the aggregates that have the specified mirrored value.

**[`-d, -disklist <disk path name>,...`] - Disks for First Plex**

If this parameter is specified, the command displays information only about the aggregates that have the specified disk or disks.

**[`-mirror-disklist <disk path name>,...`] - Disks for Mirrored Plex**

If this parameter is specified, the command displays information only about the aggregates that have the specified disk or disks present in the mirrored plex.

**[`-node {<nodename>|local}`] - Node**

If this parameter is specified, the command displays information only about the aggregates that are located on the specified node.

**[`-free-space-realloc {on|off}`] - Free Space Reallocation**

If this parameter is specified, the command displays whether free space reallocation is enabled on the specified aggregate.

**[`-ha-policy {sfo|cfo}`] - HA Policy**

This optionally specifies the high-availability policy to be used in the context of a root recovery procedure. Do not modify this setting unless directed to do so by a customer support

representative.

**[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies**

If this parameter is specified, the command displays information only about the aggregates that have the specified space reserved for Snapshot copies.

**[-space-nearly-full-threshold-percent <percent>] - Aggregate Nearly Full Threshold Percent**

If this parameter is specified, the command displays information only about the aggregates that have the specified nearly full threshold percent.

**[-space-full-threshold-percent <percent>] - Aggregate Full Threshold Percent**

If this parameter is specified, the command displays information only about the aggregates that have the specified full threshold percent.

**[-hybrid-enabled {true|false}] - Hybrid Enabled**

If this parameter is specified, the command displays information only about the aggregates that are eligible to contain both SSD and non-SSD RAID groups.

**[-availsize {<integer>[KB|MB|GB|TB|PB]}] - Available Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified available size.

**[-chksumenabled {true|false}] - Checksum Enabled**

If this parameter is specified, the command displays information only about the aggregates that have the specified checksum setting.

**[-chksumstatus <text>] - Checksum Status**

If this parameter is specified, the command displays information only about the aggregates that have the specified checksum status. The possible values for checksum status include the following: active, off, reverting, none, unknown, initializing, reinitializing, reinitialized, upgrading\_phase1, and upgrading\_phase2.

**[-cluster <text>] - Cluster**

If this parameter is specified, the command displays information only about the aggregates that are owned by nodes in the specified cluster. By default, only local cluster aggregates are displayed.

**[-cluster-id <UUID>] - Home Cluster ID**

If this parameter is specified, the command displays information only about the aggregates that are owned by nodes in the cluster specified by the cluster UUID. By default, only local cluster aggregates are displayed.

**[-dr-home-id <integer>] - DR Home ID**

If this parameter is specified, the command displays information only about the aggregates whose Disaster Recovery home node has the specified system ID.

**[-dr-home-name <text>] - DR Home Name**

If this parameter is specified, the command displays information only about the aggregates

whose Disaster Recovery home is the specified node.

**[-inofile-version <integer>] - Inofile Version**

If this parameter is specified, the command displays information only about the aggregates whose inode files are at the specified version.

**[-has-mroot {true|false}] - Has Mroot Volume**

If this parameter is specified, the command displays information about only the aggregates that contain their owning node's management root directory.

**[-has-partner-mroot {true|false}] - Has Partner Node Mroot Volume**

If this parameter is specified, the command displays information about only the aggregates that contain the management root directory of their owning node's failover partner.

**[-home-id <integer>] - Home ID**

If this parameter is specified, the command displays information only about the aggregates whose home node has the specified system ID.

**[-home-name <text>] - Home Name**

If this parameter is specified, the command displays information only about the aggregates whose home node is the specified node.

**[-hybrid-cache-size-total {<integer>[KB|MB|GB|TB|PB]}] - Total Hybrid Cache Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified total cache size in a Flash Pool.

**[-hybrid {true|false}] - Hybrid**

If this parameter is specified, the command displays information only about the aggregates that currently contain both SSD and non-SSD RAID groups.

**[-inconsistent {true|false}] - Inconsistent**

If this parameter is specified, the command displays information only about the aggregates that have the specified consistency.

**[-is-home {true|false}] - Is Aggregate Home**

If this parameter is specified, the command displays information only about the aggregates whose home node and owner node have the same system ID.

**[-s, -maxraidsize <integer>] - Max RAID Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified maximum number of disks for RAID groups.

For Flash Pools, this option controls the maximum size of the HDD RAID groups.

**[-cache-raid-group-size <integer>] - Flash Pool SSD Tier Maximum RAID Group Size**

If this parameter is specified, the command displays information about the maximum RAID group size for the SSD tier for Flash Pools.

This parameter is applicable only for Flash Pools.

### **[-owner-id <integer>] - Owner ID**

If this parameter is specified, the command displays information only about the aggregates that are owned by the node with the specified system ID.

### **[-owner-name <text>] - Owner Name**

If this parameter is specified, the command displays information only about the aggregates that are owned by the specified node.

### **[-percent-used <percent>] - Used Percentage**

If this parameter is specified, the command displays information only about the aggregates that have the specified used size, as a percentage.

### **[-plexes <text>,...] - Plexes**

If this parameter is specified, the command displays information only about the aggregates that have the specified plex or plexes.

### **[-raidgroups <text>,...] - RAID Groups**

If this parameter is specified, the command displays information only about the aggregates that have the specified RAID group or groups.

### **[-raidstatus <text>] - RAID Status**

If this parameter is specified, the command displays information only about the aggregates that have the specified RAID status. The possible values for RAID status are normal, copying, ironing, degraded, mirror degraded, growing, initializing, invalid, needs check, partial, reconstruct, raid4, raid\_ep, raid0, raid\_dp, raid\_tec, redirect, and wafl inconsistent. You can specify multiple values (for example, reconstruct and growing).

### **[-t, -raidtype {raid\_tec|raid\_dp|raid4|raid\_ep}] - RAID Type**

If this parameter is specified, the command displays information only about the aggregates that use the specified RAID type. The possible values are **raid0** for RAID 0, **raid4** for RAID4 of disks other than **SSD-ZNS**, **raid\_ep** for RAID4 of **SSD-ZNS** disks with additional RAID4 protection inside each disk, **raid\_dp** for RAID-DP, **raid\_tec** for RAID-TEC, and **mixed\_raid\_type** for aggregates that include a mix of RAID types.

### **[-resyncsnaptime <integer>] - SyncMirror Resync Snapshot Frequency in Minutes**

If this parameter is specified, the command displays information only about the aggregates whose SyncMirror Resynchronization Snapshot Frequency is the specified value.

### **[-root {true|false}] - Is Root**

If this parameter is specified, the command displays information about only the root aggregates in the cluster.

### **[-sis-metadata-space-used {<integer>[KB|MB|GB|TB|PB]}] - Space Used by Metadata for Volume Efficiency**

If this parameter is specified, the command displays information about only the aggregates with the specified space used by A-SIS metafiles for volume efficiency. This parameter is deprecated in

Data ONTAP 8.2 and later. Use the volume-footprint-list-info API for details related to space usage by deduplication metadata

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified size. The size of the aggregate is reported as the size available for use by WAFL, excluding WAFL reserve and aggregate Snapshot reserve capacity. Use the [storage aggregate show-space](#) command to see the details of space utilization within an aggregate.

**[-state <aggregate state>] - State**

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

**[-usedsize {<integer>[KB|MB|GB|TB|PB]}] - Used Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified used size.

**[-uses-shared-disks {true|false}] - Uses Shared Disks**

Selects the aggregates that match this parameter value. This parameter is used to list all the aggregates that use shared HDDs or shared SSDs.

**[-uuid <text>] - UUID String**

If this parameter is specified, the command displays information only about the aggregate that has the specified UUID. This parameter is available only at the advanced privilege level and higher.

**[-volcount <integer>] - Number Of Volumes**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of volumes.

**[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate**

If this parameter is specified, the command displays information only about the aggregates that are considered by the Auto Balance Aggregate feature.

**[-autobalance-state <Auto Balance Aggregate state>] - State of the aggregate being balanced**

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

**[-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified physical used size. This differs from **total-used** space by the space that is guaranteed for future writes. The value includes blocks in use by Snapshot copies.

**[-physical-used-percent <percent\_no\_limit>] - Physical Used Percentage**

If this parameter is specified, the command displays information only about the aggregates that have the specified physical used percent.

**[-autobalance-state-change-counter <integer>] - State Change Counter for Auto Balancer**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of state change caused by the Auto Balance Aggregate feature.

**[-L, -snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

If this parameter is specified, the command displays information only about the aggregates that have the specified snaplock-type.

**[-is-nve-capable {true|false}] - Is NVE Capable**

This parameter indicates whether or not the aggregate is capable of supporting NVE (Volume Encryption).

**[-is-cft-precommit {true|false}] - Is in the precommit phase of Copy-Free Transition**

Selects the aggregates that are set with this parameter value. This parameter lists all the aggregates that are in the precommit phase of a Copy-Free Transition workflow.

**[-is-transition-out-of-space {true|false}] - Is a 7-Mode transitioning aggregate that is not yet committed in clustered Data ONTAP and is currently out of space**

Selects the aggregates that match this parameter value. This parameter is used to list all the 7-mode transitioning aggregates that are not yet committed in clustered Data ONTAP, and are currently out of space.

**[-autobalance-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered Unbalanced (%)**

If this parameter is specified, the command displays information only about the aggregates that have the specified unbalanced threshold percentage.

**[-autobalance-available-threshold-percent <integer>] - Threshold When Aggregate Is Considered Balanced (%)**

If this parameter is specified, the command displays information only about the aggregates that have the specified available threshold percentage.

**[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority**

This parameter indicates the relative priority that is used to decide whether a mirrored aggregate can start a resynchronization operation or not. This field is not set for unmirrored aggregates.

Use the [storage aggregate resynchronization modify](#) command to modify this field for mirrored aggregates.

The valid values for this field are:

- high(fixed): This value is reserved for Data ONTAP system aggregates, which cannot have any other value for this field. It cannot be explicitly set on a data aggregate. These aggregates always start their resynchronization operation at the first available opportunity.
- high: Mirrored data aggregates with this priority value start resynchronization first.
- medium: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started

resynchronization.

- low: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

**[-data-compaction-space-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Data Compaction**

This parameter indicates the amount of the space saved by Data Compaction in bytes.

**[-data-compaction-space-saved-percent <percent>] - Percentage Saved by Data Compaction**

This parameter indicates the percentage of space saved in the aggregate by Data Compaction.

**[-data-compacted-count {<integer>[KB|MB|GB|TB|PB]}] - Amount of compacted data**

This parameter indicates the number of bytes occupied by compacted data inside this aggregate.

**[-creation-timestamp <MM/DD/YYYY HH:MM:SS>] - Timestamp of Aggregate Creation**

This parameter indicates the date and time the aggregate was created.

**[-single-instance-data-logging {off|on}] - Enable SIDL**

If this parameter is specified, the command displays whether Single Instance Data Logging feature is enabled on the specified aggregate.

**[-composite {true|false}] - Composite**

If this parameter is specified, the command displays information only about aggregates whose classification as a FabricPool matches the specified value. A FabricPool has an external capacity tier attached to it.

**[-is-fabricpool-mirrored {true|false}] - Is FabricPool Mirrored**

If this parameter is specified, the command displays information only about FabricPools whose classification as mirrored matches the specified value. A mirrored FabricPool has a second external capacity tier attached to it.

**[-composite-capacity-tier-used {<integer>[KB|MB|GB|TB|PB]}] - Capacity Tier Used Size**

If this parameter is specified, the command displays the amount of space in use in the attached external capacity tier.

**[-sis-space-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Storage Efficiency**

This parameter indicates the total amount of space saved by storage efficiency in bytes.

**[-sis-space-saved-percent <percent>] - Percentage of Space Saved by Storage Efficiency**

This parameter indicates the percentage of space saved by storage efficiency.

**[-sis-shared-count {<integer>[KB|MB|GB|TB|PB]}] - Amount of Shared bytes count by Storage Efficiency**

This parameter indicates the number of bytes shared by storage efficiency.

**[-is-inactive-data-reporting-enabled {true|false}] - Inactive Data Reporting Enabled**

If this parameter is specified, the command displays whether reporting of inactive user data is enabled. This parameter is not allowed on FabricPools

**[-inactive-data-reporting-start-timestamp <MM/DD/YYYY HH:MM:SS>] - Timestamp when Inactive Data Reporting was Enabled**

If this parameter is specified, the command displays the timestamp at which inactive data reporting was enabled on the aggregate. This parameter is not allowed on FabricPools.

**[-encrypt-with-aggr-key {true|false}] - Enable Aggregate level Encryption**

Selects the aggregates that are encrypted with aggregate keys.

**[-drive-protection-enabled {true|false}] - Aggregate uses data protected SEDs**

If this parameter is specified, the command displays whether this aggregate is entirely composed of self-encrypting drives that have data protection enabled.

**[-azcs-read-optimization {on|off}] - azcs read optimization**

If this parameter is specified, the command displays whether azcs-with-compression feature is enabled.

**[-space-required-for-revert {<integer>[KB|MB|GB|TB|PB]}] - Metadata Reserve Space Required For Revert**

If this parameter is specified, the command displays the additional amount of free space needed for metadata reserve in the aggregate if the system is required to revert to an ONTAP release earlier than 9.11.1x.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster1::> storage aggregate show
Aggregate      Size Available Used% State   #Vols Nodes           RAID Status
-----
aggr0          6.21TB    1.78TB    71% online    49 cluster1-01    raid_dp,
normal
aggr1          56.04MB   55.89MB    0% online     0 cluster1-02    raid_dp,
mirrored,
normal
aggr2          1.77TB    1.63TB    8% online     1 cluster1-01    raid_dp,
normal
aggr3          1.77TB    1.73TB    2% online     2 cluster1-02    raid_dp,
normal
4 entries were displayed.
```

The following example displays information about an aggregate name aggr1:

```
cluster1::> storage aggregate show -aggregate aggr1
Aggregate: aggr1
Checksum Style: block
Number Of Disks: 6
```

```

Mirror: true
Nodes: cluster1-02
Disks for First Plex: 1.1.2,
                    1.1.10,
                    1.1.11
Disks for Mirrored Plex: 1.1.6,
                        1.1.8,
                        1.1.9
Free Space Reallocation: off
HA Policy: sfo
Space Reserved for Snapshot Copies: 5%
Hybrid Enabled: false
Available Size: 53.10MB
Block Type: 64-bit
Checksum Enabled: true
Checksum Status: active

# storage aggregate verify

Verify an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate verify** command verifies the two plexes of an aggregate. It compares the data in the two plexes to ensure that the plexes are identical. It can be used whenever the administrator needs to ensure that the two plexes are completely synchronized with each other. To view any discrepancies, use the following command:

```
event log show -message-name raid.mirror.verify.mismatch
```

## Parameters

### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to be verified. If no aggregate is specified then the action specified by the parameter **-action** will be taken on all the aggregates.

### **-action {start|stop|resume|suspend|status} - Action**

This parameter specifies the action to be taken. The possible actions are:

- start - Starts a verify.
- stop - Permanently stops a verify. A stopped verify cannot be resumed.
- resume - Resumes a suspended verify.
- suspend - Suspends a verify.
- status - Displays the current status of a verify.

### **[-plex-to-fix <text>] - Plex to be Corrected in Case of Mismatches**

This parameter specifies the name of a plex to fix in case the two plexes of the aggregate do not match. The default behavior is to log any discrepancies instead of fixing them.

This parameter is only applicable when the command is used to start a verify.

## Examples

The following example starts a verify on an aggregate named aggr1.

```
cluster1::> storage aggregate verify -aggregate aggr1 -action start
```

The following example queries the status of a verify on an aggregate named aggr1.

```
cluster1::> storage aggregate verify -aggregate aggr1 -action status
Aggregate:aggr1, Is Suspended:false, Percentage Completed:19.03%
```

The following example starts a verify on all the aggregates.

```
cluster1::> storage aggregate verify -action start
```

## storage aggregate efficiency show

Display aggregate storage efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate efficiency show** command displays information about the different storage efficiency of all the aggregates. If no parameters are specified, the command displays the following information for all aggregates:

- Aggregate
- Node
- Cross-vol-background-dedupe State (Enabled, Disabled)
- Cross-vol-inline-dedupe State (Enabled, Disabled)

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -aggregate <aggregate name> ] - Aggregate**

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

**[ -node {<nodename>|local} ] - Node**

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

**[ -cross-volume-background-dedupe {true|false} ] - Cross Volume Background Deduplication**

Displays whether the cross volume background deduplication is enabled/disabled in the aggregate.

**[ -cross-volume-inline-dedupe {true|false} ] - Cross Volume Inline Deduplication**

Displays whether the cross volume inline deduplication is enabled/disabled in the aggregate.

**[ -cross-volume-dedupe-savings {true|false} ] - Has Cross Volume Deduplication Savings**

Displays whether the aggregate may have savings from cross volume deduplication.

**[ -auto-adaptive-compression-savings {true|false} ] - Has Auto Adaptive Compression Savings**

Displays whether the aggregate may have auto adaptive compression savings.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```

cluster:::> storage aggregate efficiency show

Aggregate: aggr0
  Node: vivek6-vs1m2

Has Cross Volume Deduplication Savings:           false
Cross Volume Background Deduplication:           false
Cross Volume Inline Deduplication:                false

Aggregate: aggr1
  Node: vivek6-vs1m2

Has Cross Volume Deduplication Savings:           true
Cross Volume Background Deduplication:           true
Cross Volume Inline Deduplication:                true
2 entries were displayed.

```

## storage aggregate efficiency stat

Display aggregate storage efficiency statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate efficiency stat` command displays storage efficiency statistics.

### Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-aggregate <aggregate name>] - Aggregate`

If this parameter is specified, the command displays storage efficiency statistics for the specified aggregate.

`[-node {<nodename>|local}] - Node`

If this parameter is specified, the command displays storage efficiency statistics for the aggregates that are located on the specified node.

**[-total-blocks-recompressed <integer>] - Total Number of Blocks Recompressed**

This field represents the total number of blocks recompressed. If this parameter is specified, the command displays storage efficiency statistics that match the specified block count.

**[-active-blocks-recompressed <integer>] - Number of Active Blocks Recompressed**

This field represents the total number of hot blocks recompressed. If this parameter is specified, the command displays storage efficiency statistics that match the specified block count.

**[-inactive-blocks-recompressed <integer>] - Number of Inactive Blocks Recompressed**

This field represents the total number of cold blocks recompressed. If this parameter is specified, the command displays storage efficiency statistics that match the specified block count.

## Examples

The following example displays storage efficiency statistics for all the aggregates that are owned by nodes in the local cluster:

```
cluster1:::> storage aggregate efficiency stat
Aggregate: aggr1
                                     Node: node1
  Total Number of Blocks Recompressed: 512
    Number of Active Blocks Recompressed: 120
    Number of Inactive Blocks Recompressed: 392
Aggregate: aggr2
                                     Node: node1
  Total Number of Blocks Recompressed: 0
    Number of Active Blocks Recompressed: 0
    Number of Inactive Blocks Recompressed: 0

2 entries were displayed.
```

# storage aggregate efficiency cross-volume-dedupe revert-to

Reverts the cross volume deduplication savings on an aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage aggregate cross-volume-dedupe revert-to` command is used to revert cross volume deduplication savings on an aggregate.

## Parameters

### **-aggregate <aggregate name> - Aggregate**

This specifies the aggregate on which cross volume deduplication savings should be reverted. If no aggregate is specified then it will revert the savings on all aggregates

### **[-c, -clean-up {true|false}] - Delete Previously Downgraded Metafiles**

This specifies whether downgrade metafile needs to be removed so that other efficiency operations can start on that aggregate.

## Examples

The following example displays information for reverting cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe revert-to -aggregate  
aggr1
```

The revert operation started on aggregate "aggr1".

```
cluster:::> storage aggregate efficiency cross-volume-dedupe revert-to -aggregate  
aggr1 -clean-up true
```

The revert operation started on aggregate "aggr1".

# storage aggregate efficiency cross-volume-dedupe show

Display aggregate cross volume deduplication efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate efficiency cross-volume-dedupe show** command displays information in detail about the different storage efficiency of all the aggregates. If no parameters are specified, the command displays the following information for all aggregates:

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -aggregate <aggregate name> ] - Aggregate**

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

**[ -node {<nodename>|local} ] - Node**

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

**[ -background-progress <text> ] - Progress**

Displays the information for the aggregates that match the specified progress.

**[ -background-op-status <text> ] - Operation Status**

Displays the information for the aggregates that match the specified operation status.

**[ -background-last-op-state <text> ] - Last Operation State**

Displays the information for the aggregates that match the specified last operation state.

**[ -background-last-success-op-begin <Date> ] - Last Success Operation Begin Time**

Displays the information for the aggregates that match the specified last successful operation begin time.

**[ -background-last-success-op-end <Date> ] - Last Success Operation End Time**

Displays the information for the aggregates that match the specified last successful operation end time.

**[ -background-last-op-begin <Date> ] - Last Operation Begin Time**

Displays the information for the aggregates that match the specified last operation begin time.

**[ -background-last-op-end <Date> ] - Last Operation End Time**

Displays the information for the aggregates that match the specified last operation end time.

**[ -background-last-op-error <text> ] - Last Operation Error**

Displays the information for the aggregates that match the specified last operation error.

**[ -background-stage <text> ] - Stage**

Displays the information for the aggregates that match the specified stage.

**[ -background-checkpoint-time <Date> ] - Checkpoint Time**

Displays the information for the aggregates that match the specified checkpoint time.

**[ -background-checkpoint-op-type <text> ] - Checkpoint Operation Type**

Displays the information for the aggregates that match the specified checkpoint operation type.

**[-background-checkpoint-stage <text>] - Checkpoint Stage**

Displays the information for the aggregates that match the specified checkpoint stage.

**[-background-dedupe {true|false}] - Background State**

Displays the information for the aggregates that match the specified cross volume background dedupe state.

**[-inline-dedupe {true|false}] - Inline State**

Displays the information for the aggregates that match the specified cross volume inline dedupe state.

**[-dedupe-savings {true|false}] - Has Cross Volume Deduplication Savings**

Displays the information for the aggregates that has some savings from cross volume deduplication.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster:::> storage aggregate efficiency cross-volume-dedupe show

Aggregate: aggr0
  Node: vivek6-vsimg2

Has Cross Volume Deduplication Savings:                false

-----:Cross Volume Background Deduplication Status:-----
State:                                                  false
Progress:                                               -
Operation Status:                                       Idle
Last Operation State:                                   Success
Last Success Operation Begin Time:                     -
Last Success Operation End Time:                       -
Last Operation Begin Time:                             -
Last Operation End Time:                               -
Last Operation Error:                                  Operation succeeded
Stage:                                                  -

```

# storage aggregate efficiency cross-volume-dedupe start

Starts the cross volume background deduplication on an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate cross-volume-dedupe start` command is used to start cross volume background deduplication on an aggregate.

## Parameters

**-aggregate <aggregate name> - Aggregate**

This specifies the aggregate on which cross volume background deduplication should be started. If no aggregate is specified then it will start on all aggregates

**[-s, -scan-old-data <true>] - Scan Old Data**

This option processes all the existing data on all volumes on the aggregate. It prompts for user confirmation before proceeding. Default value is **false**.

## Examples

The following example displays information for starting cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe start -aggregate aggr1
The efficiency operation on aggregate "aggr1" has started.
```

```
cluster:::> storage aggregate efficiency cross-volume-dedupe start -aggregate aggr1
-scan-old-data true
The efficiency operation on aggregate "aggr1" has started.
```

## storage aggregate efficiency cross-volume-dedupe stop

Stops the cross volume background deduplication on an aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate cross-volume-dedupe stop** command is used to stop cross volume background deduplication on an aggregate.

## Parameters

**-aggregate <aggregate name> - Aggregate**

This specifies the aggregate on which cross volume background deduplication should be stopped. If no aggregate is specified then it will stop on all aggregates

## Examples

The following example displays information for stopping cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe stop -aggregate aggr1
The efficiency operation on aggregate "aggr1" is being stopped.
```

## storage aggregate encryption show-key-id

Display encrypted aggregate information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate encryption show-key-id** command displays the key IDs of all NAE (Aggregate Encryption) aggregates.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate**

If this parameter is specified, the command displays information only about the specific NAE (Aggregate Encryption) aggregate.

**[-aggrID <UUID>] - Aggregate UUID**

If this parameter is specified, the command displays the key ID of the specified NAE (Aggregate Encryption) aggregate ID.

**[-keyid-index-zero <text>, ...] - 0th Index Keyid**

If this parameter is specified, the command displays the 0th index key ID of NAE (Aggregate Encryption) aggregates.

# storage aggregate inode-upgrade resume

Resume suspended inode upgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate inode-upgrade resume** command resumes a suspended inode upgrade process. The inode upgrade process might have been suspended earlier due to performance reasons.

## Parameters

**-node {<nodename>|local} - Node Name**

If this parameter is specified, the command resumes the upgrade process of an aggregate that is

located on the specified node.

### **-aggregate <aggregate name> - Aggregate Name**

This specifies the aggregate for which the inode upgrade process is to be resumed.

## Examples

The following example resumes an aggregate upgrade process:

```
cluster1::> storage aggregate inode-upgrade resume -aggregate aggr1
```

# storage aggregate inode-upgrade show

Display inode upgrade progress

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate inode-upgrade show** command displays information about aggregates undergoing the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all aggregates undergoing the inode upgrade process. The default fields are:

- aggregate
- status
- scan-percent
- remaining-time
- space-needed
- scanner-progress

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate Name**

If this parameter is specified with the **-node** parameter, the command displays detailed

information about the specified aggregate. If only this parameter is specified, the command displays information about all aggregates that match the specified name.

#### **[-node <nodename>] - Node Name**

If this parameter is specified, the command displays information only about the aggregate or aggregates that are located on the specified node.

#### **[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] - Upgrade Status**

If this parameter is specified, the command displays information only about the aggregate or aggregates that match the specified inode upgrade status.

#### **[-scan-percent <percent>] - Upgrade Scan Percent Complete**

If this parameter is specified, the command displays information only about the aggregate or aggregates that match the specified inode upgrade progress percentage.

#### **[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Complete Upgrade**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the space needed to complete the upgrade process matches the specified size.

#### **[-remaining-time [<integer>h][<integer>m][<integer>s]>] - Remaining Upgrade Time**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the remaining time to complete the inode upgrade process matches the specified time.

#### **[-scanner-progress <text>] - Scanner Progress**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the progress of the inode upgrade process matches the input.

## Examples

The following example displays information about all aggregates undergoing the inode upgrade process:

```
cluster1::> storage aggregate inode-upgrade show
Aggregate Status    %Complete Time Remaining Space Needed Inode Progress
-----
aggr0    pending    0%      -      20.36MB    Public : Inode 0 out of
65562
aggr1    pending    0%      -      19.84MB    Public : Inode 0 out of
63714
```

# storage aggregate object-store attach

Attach an object store to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store attach** command attaches an object store to an aggregate to create a FabricPool. This command requires two parameters to create a FabricPool - an aggregate and a configuration to attach an object-store to the aggregate. This command verifies whether the object store is accessible through the intercluster LIF both from the node on which the aggregate is present as well as its High Availability (HA) partner node. The command fails if the object store is not accessible. Once an object store is attached to an aggregate, it cannot be detached.

## Parameters

### **-aggregate <text> - Name of the Aggregate**

This parameter specifies the aggregate to which the object store must be attached to create a FabricPool.

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration that describes the object store to be attached. The object store configuration has information about object store server name, port, access credentials, and provider type.

### **[-allow-flexgroup {true|false}] - Allow Existing FlexGroup Constituents in the Aggregate on Attach**

This optional parameter allows attaching object store to an aggregate already containing FlexGroup constituents. The default value is false. Mixing FabricPools and non-FabricPools within a FlexGroup is not recommended. All aggregates hosting constituents of a FlexGroup should be attached to the object store.

## Examples

The following example attaches an object store to aggregate aggr1:

```
cluster1::>storage aggregate object-store attach -aggregate aggr1 -object-store-name my-store
```

# storage aggregate object-store mirror

Attaches a second object store to a FabricPool aggregate to create a mirror

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store mirror** command attaches a second object store to a FabricPool aggregate to create a mirror. This command verifies whether the object store is accessible through the intercluster LIF from both the node on which the aggregate is present and from its high-availability (HA) partner node. The command fails if the object store is not accessible.

## Parameters

### **-aggregate <text> - Name of the Aggregate**

This parameter specifies the aggregate to which the object store must be attached in order to create a mirror.

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the name of the new object store configuration to be attached to the aggregate. The object store configuration has information about the object store server name, port, access credentials, and provider type.

## Examples

The following example shows how to create a mirror to aggregate aggr1:

```
cluster1::>storage aggregate object-store mirror -aggregate aggr1 -object-store-name my-store-2
```

# storage aggregate object-store modify

Modify attributes of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store modify** command is used to update one or more object store parameters.

## Parameters

### **-aggregate <text> - Aggregate Name**

This parameter identifies the aggregate to which the object store to be modified is attached.

**-object-store-name <text> - ONTAP Name for this Object Store Config**

This parameter identifies the configuration name of the object store to be modified.

**[-unreclaimed-space-threshold <percent>] - Threshold for Reclaiming Unreferenced Space**

This optional parameter specifies the usage threshold below which Data ONTAP reclaims unused space from objects in the object store. When Data ONTAP writes data to the object store, it packages multiple file system blocks into one object. Over time, blocks stored in an object can be freed, leaving part of the object unused. When the percentage of used blocks in an object falls below this threshold, a background task moves the blocks which are still used to a new object. Afterwards, Data ONTAP frees the original object to reclaim the unused space. Valid values are between 0% and 99%. The default value depends on the object store's provider type. It is 20% for **AWS\_S3** , 25% for **Azure\_Cloud** , 40% for **SGWS** , 20% for **IBM\_COS** , 20% for **AliCloud** , 20% for **GoogleCloud** and 40% for **ONTAP\_S3** . Consult the FabricPool best practices guidelines for more information.

**[-tiering-fullness-threshold <percent>] - Aggregate Fullness Threshold Required for Tiering**

This optional parameter specifies the percentage of space in the performance tier which must be used before data is tiered out to the capacity tier.

**[-mirror-type {primary|mirror}] - Object Store Mirror Type**

This parameter specifies the object store mirror type. Valid mirror types are **primary** or **mirror** .

**[-force-tiering-on-metrocluster {true|false}] - Force Tiering with no Mirror in a MetroCluster Configuration**

This parameter specifies force tiering option enabled or not on primary object stores for aggregates in a MetroCluster configuration.

**[-migrate-threshold <percent>] - Minimum Aggregate Space Threshold**

This optional parameter specifies the minimum percentage of performance tier free space that must exist in order for migration of data from the capacity tier to performance tier to be allowed.

## Examples

The following example modifies the unreclaimed space threshold of an object store attached to an aggregate named aggr1:

```
cluster1::> storage aggregate object-store modify -aggregate aggr1 -object-store-name my-store -unreclaimed-space-threshold 20%
```

# storage aggregate object-store show-freeing-status

Show status of background object freeing work after aggregate delete

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate object-store show-freeing-status** command displays status information about the background work that frees an aggregate's objects from an object store after a storage aggregate delete.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -bin-uuid <UUID> ] - UUID of the Bin**

If this parameter is specified, the command displays information only about the aggregate attached to the specified bin UUID.

**[ -config-id <integer> ] - Object Store Config ID**

If this parameter is specified, the command displays information only about the aggregate attached to the object-store with specified config ID.

**[ -object-store-name <text> ] - Object Store Configuration Name**

If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.

**[ -aggregate-name <aggregate name> ] - Aggregate**

If this parameter is specified, the command displays information only about the specified aggregates that were deleted.

**[ -request-state {queued|running|cleaning-up|finishing} ] - Request State**

If this parameter is specified, the command displays information only about the object stores that have the specified object freeing request state.

**[ -num-objects-freed <integer> ] - Num Objects Freed**

If this parameter is specified, the command displays information only about the object stores that have the specified number of objects that have been freed.

**[ -last-error <text> ] - The Last Error Encountered**

If this parameter is specified, the command displays information only about the object stores that have the specified last error encountered.

## Related Links

- [storage aggregate delete](#)

# storage aggregate object-store show-resync-status

Display object store mirror resync progress

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The ``storage aggregate object-store show-resync-status`` command displays information about the progress of resync for mirror object stores attached to a FabricPool.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ -instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[ -aggregate <aggregate name> ] - Aggregate`

If this parameter is specified, the command displays information only about the specified aggregates.

`[ -primary-object-store-name <text> ] - Primary Object Store Name`

If this parameter is specified, the command displays information only about aggregates whose primary object store configuration name matches the specified names.

`[ -mirror-object-store-name <text> ] - Mirror Object Store Name`

If this parameter is specified, the command displays information only about aggregates whose mirror object store configuration name matches the specified names.

`[ -percent-complete <percent> ] - Resync Complete Percentage`

If this parameter is specified, the command displays information only about aggregates whose mirror object store resync progress percentage matches the specified value.

## Examples

The following example displays resync progress for all aggregates with mirror object stores which are not in sync:

```
cluster1::>storage aggregate object-store show-resync-status
```

# storage aggregate object-store show-space

Display space utilization of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store show-space` command displays information about the amount of space used in the object store for each of the aggregates in FabricPool. The used space is displayed in both absolute size as well as a percentage of the FabricPool license limit.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate Name**

If this parameter is specified, the command displays space information only about object stores that are attached to the specified aggregates.

**[-object-store-name <text>] - ONTAP Name for this Object Store Config**

If this parameter is specified, the command displays space information only about object stores whose configuration name matches the specified names.

**[-object-store-availability <object Store Availability>] - Availability of the Object Store**

If this parameter is specified, the command displays space information about the object stores whose availability status matches the specified value. Supported values with this parameter are `-available` and `-unavailable`.

**[-object-store-unavailable-reason <text>] - Reason why Object Store is Unavailable**

If this parameter is specified, the command displays information only about object stores whose unavailability reason matches the specified reason.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-license-used-percent <percent\_no\_limit>] - License Space Used Percent**

If this parameter is specified, the command displays space information only about object stores whose space used by the associated aggregate as a percentage of the license limit matches the specified value. If the object store does not require a license, then this field is not set.

**[-unreclaimed-space-threshold <percent>] - Threshold for Reclaiming Unreferenced Space**

If this parameter is specified, the command displays information only about object stores whose threshold for reclaiming unused space from objects in the object store matches the specified value.

**[-tiering-fullness-threshold <percent>] - Aggregate Fullness Threshold Required for Tiering**

If this parameter is specified, the command displays information only about object stores whose performance tier fullness threshold for tiering matches the specified value.

**[-mirror-type {primary|mirror}] - Object Store Mirror Type**

If this parameter is specified, the command displays information about object stores with a mirror-type that matches the specified value.

**[-is-mirror-degraded {true|false}] - This object store is in mirror degraded mode**

If this parameter is specified, the command displays information only about mirror object stores which have the specified mirror degraded state.

**[-force-tiering-on-metrocluster {true|false}] - Force Tiering with no Mirror in a MetroCluster Configuration**

If this parameter is specified, the command displays information only about primary object stores for which force tiering is toggled on for aggregates in a MetroCluster configuration.

**[-cluster <Cluster name>] - The name of the Cluster to which the bin belongs**

If this parameter is specified, the command displays information only about object stores for which cluster matches the specified value.

**[-migrate-threshold <percent>] - Minimum Aggregate Space Threshold**

If this parameter is specified, the command displays information only about object stores whose performance tier migrate threshold matches the specified value.

## Examples

The following example displays space information about all object stores:

```
cluster1::>storage aggregate object-store show-space
```

# storage aggregate object-store show

Display the details of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store show** command displays information about all the object stores in the system.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate Name**

If this parameter is specified, the command displays information only about the object stores that are attached to the specified aggregates.

**[-object-store-name <text>] - ONTAP Name for this Object Store Config**

If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.

**[-object-store-availability <object Store Availability>] - Availability of the Object Store**

If this parameter is specified, the command displays information only about object stores whose availability status matches the specified value. Supported values with this parameter are - available and unavailable.

**[-object-store-unavailable-reason <text>] - Reason why Object Store is Unavailable**

If this parameter is specified, the command displays information only about object stores whose unavailability reason matches the specified reason.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-license-used-percent <percent\_no\_limit>] - License Space Used Percent**

If this parameter is specified, the command displays information only about object stores whose space used by the aggregate as a percentage of the license limit matches the specified value.

**[-unreclaimed-space-threshold <percent>] - Threshold for Reclaiming Unreferenced Space**

If this parameter is specified, the command displays information only about object stores whose threshold for reclaiming unused space from objects in the object store matches the specified value.

**[-tiering-fullness-threshold <percent>] - Aggregate Fullness Threshold Required for Tiering**

If this parameter is specified, the command displays information only about object stores whose performance tier fullness threshold for tiering matches the specified value.

**[-mirror-type {primary|mirror}] - Object Store Mirror Type**

If this parameter is specified, the command displays information about object stores with a mirror-type that matches the specified value.

**[-is-mirror-degraded {true|false}] - This object store is in mirror degraded mode**

If this parameter is specified, the command displays information only about mirror object stores which have the specified mirror degraded state. When a mirror object store is attached to a FabricPool, it is initially degraded because it does not contain a copy of all the data in the primary object store. While the mirror is degraded, all reads are served from the primary object store, and the mirror cannot be promoted to become the primary. After the resync process copies all data from the primary object store to the mirror, the mirror is no longer degraded. From that point on the mirror is always kept in sync with the primary and never becomes degraded again.

**[-force-tiering-on-metrocluster {true|false}] - Force Tiering with no Mirror in a MetroCluster Configuration**

If this parameter is specified, the command displays information only about primary object stores for which force tiering is toggled on for aggregates in a MetroCluster configuration.

**[-cluster <Cluster name>] - The name of the Cluster to which the bin belongs**

If this parameter is specified, the command displays information only about object stores for which cluster matches the specified value.

**[-migrate-threshold <percent>] - Minimum Aggregate Space Threshold**

If this parameter is specified, the command displays information only about object stores whose performance tier migrate threshold matches the specified value.

## Examples

The following example displays all information about all object stores:

```
cluster1::>storage aggregate object-store show
```

# storage aggregate object-store unmirror

Remove the second object store from a mirrored FabricPool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store unmirror** command detaches a second object store from a mirrored FabricPool. This command verifies whether the primary object store is accessible through the intercluster LIF from both the node on which the aggregate is present and from its high-availability (HA) partner node. The command fails if the primary object store is not available.

## Parameters

**-aggregate <text> - Name of the Aggregate**

This parameter specifies the aggregate from which the mirrored object store must be removed.

## Examples

The following example shows how to unmirror a mirrored FabricPool aggr1:

```
cluster1::>storage aggregate object-store unmirror -aggregate aggr1
```

# storage aggregate object-store config create

Define the configuration for an object store

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store config create** command is used by a cluster administrator to tell Data ONTAP how to connect to an object store. Following pre-requisites must be met before creating an object store configuration in Data ONTAP.

- A valid data bucket or container must be created with the object store provider. This assumes that the user has valid account credentials with the object store provider to access the data bucket.
- The Data ONTAP node must be able to connect to the object store. This includes
- Fast, reliable connectivity to the object store.
- An inter-cluster LIF (Logical Interface) must be configured on the cluster. Data ONTAP will verify connectivity prior to saving this configuration information.
- If SSL/TLS authentication is required, then valid certificates must be installed.
- FabricPool license (required for Amazon S3 and Azure object stores).

An object-store configuration once created must not be reassociated with a different object-store or

container. See [storage aggregate object-store config modify](#) command for more information. If neither the **access-key** nor the **secret-password** are provided while setting up a configuration for AWS\_S3 object store in Cloud Volumes ONTAP, then the access key (access key ID), the secret password (secret access key), and the session token will be retrieved from EC2 instance metadata for the AWS Identity and Access Management (IAM) role associated with the EC2 instance. If Data ONTAP is unable to create a object store configuration, then the command will fail explaining the reason for failure.

## Parameters

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the name that will be used to identify the object store configuration. The name can contain the following characters: "", "-", A-Z, a-z, and 0-9. *The first character must be one of the following: "", A-Z, or a-z.*

### **-provider-type <providerType> - Type of the Object Store Provider**

This parameter specifies the type of object store provider that will be attached to the aggregate. Valid options are: AWS\_S3 (Amazon S3 storage), Azure\_Cloud (Microsoft Azure Cloud), SGWS (StorageGrid WebScale), IBM\_COS (IBM Cloud Object Storage), AliCloud (Alibaba Cloud Object Storage Service), GoogleCloud (Google Cloud Storage) and ONTAP\_S3.

### **[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

This parameter specifies where the system obtains credentials for authentication to an object store. The available choices depend on the platform (Cloud Volumes ONTAP or not) and provider-type (AWS\_S3 or not). The **keys** value is always applicable, and if selected means that the **access-key** and **secret-password** are provided by the system administrator. In Cloud Volumes ONTAP, the **EC2-IAM** value is also applicable. It means that the IAM role is associated with the EC2 instance, and that the **access-key**, **secret-password** and session token are retrieved from EC2 instance metadata for this IAM role. Note that **-use-iam-role** and **-auth-type** are mutually exclusive, **-auth-type EC2-IAM** is an equivalent of **-use-iam-role true**, and **-auth-type key** is an equivalent of **-use-iam-role false**. In Cloud Volumes ONTAP, the **GCP-SA** value may also be applicable. It means that a session token is retrieved from the GCP instance metadata for the Service Account associated with the GCP instance. Similarly, **Azure-MSI** means that a session token is retrieved from the Azure instance metadata for the Managed Service Identity (MSI) associated with the Azure instance. For the **AWS\_S3** provider, the **CAP** (C2S Authentication Portal) value is also applicable. This should only be used when accessing C2S (Commercial Cloud Services). If the **CAP** value is specified, then the `\-cap-url` must be specified. See `cap-url`.

### **[-cap-url <text>] - URL to Request Temporary Credentials for C2S Account**

This parameter is available only when **-auth-type** is **CAP**. It specifies a full URL of the request to a CAP server for retrieving temporary credentials (access-key, secret-password and session token) for accessing the object store server. The CAP URL may look like: <https://123.45.67.89:1234/CAP/api/v1/credentials?agency=myagency=mymission=myrole>

### **-server <Remote InetAddress> - Fully Qualified Domain Name of the Object Store Server**

This parameter specifies the Fully Qualified Domain Name (FQDN) of the remote object store server. For Amazon S3, server name must be an AWS regional endpoint in the format

s3.amazonaws.com or s3-<region>.amazonaws.com, for example, s3-us-west-2.amazonaws.com. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the **-server** is a "blob.core.windows.net" or a "blob.core.usgovcloudapi.net", then a value of **-azure-account** followed by a period will be added in front of the server.

#### **[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

This parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store. The default value is **true**.

#### **[-port <integer>] - Port Number of the Object Store**

This parameter specifies the port number on the remote server that Data ONTAP will use while establishing connection to the object store.

#### **-container-name <text> - Data Bucket/Container Name**

This parameter specifies the data bucket or container that will be used for read and write operations.

This name cannot be modified once a configuration is created.

#### **{ [-access-key <text>] - Access Key ID for S3 Compatible Provider Types**

This parameter specifies the access key (access key ID) required to authorize requests to the AWS S3, SGWS, IBM COS object stores and ONTAP\_S3. For an Azure object store see **-azure-account**.

#### **[-secret-password <text>] - Secret Access Key for S3 Compatible Provider Types**

This parameter specifies the password (secret access key) to authenticate requests to the AWS S3, SGWS, IBM COS object stores and ONTAP\_S3. If the **-access-key** is specified but the **-secret-password** is not, then one will be asked to enter the **-secret-password** without echoing the input. For an Azure object store see **-azure-private-key**.

#### **[-azure-account <text>] - Azure Account**

This parameter specifies the account required to authorize requests to the Azure object store. For other object store providers see **access-key**.

The value of this field cannot be modified once a configuration is created.

#### **[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing**

If this parameter is true then one will be asked to enter **-azure-private-key** without echoing the input. Default value: **true**.

#### **[-azure-private-key <text>] - Azure Access Key }**

This parameter specifies the access key required to authenticate requests to the Azure object store. See also **ask-azure-private-key**. For other object store providers see **-secret-password**.

#### **[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

This optional parameter specifies the IPspace to use to connect to the object store. Default value: **Default**.

**[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

This parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when **is-ssl-enabled** is **true** . The default value is **true** . It is recommended to use the default value to make sure that Data ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

**[-use-http-proxy {true|false}] - Use HTTP Proxy**

This optional parameter indicates whether an HTTP proxy will be used for connecting to an object store. Note that an HTTP proxy is configured using the **vserver http-proxy** commands at the **diagnostic** privilege level. Default value: **false** .

**[-cluster <cluster name>] - The Name of the Cluster to which the Configuration Belongs**

This optional parameter should only be specified in MetroCluster switched-over mode and specifies the name of the cluster for which the configuration must be created. By default the configuration is created for the local cluster.

**[-server-side-encryption {none | SSE-S3}] - Encryption of Data at Rest by the Object Store Server**

This parameter specifies if AWS or other S3 compatible object store server must encrypt data at rest. The available choices depend on provider-type. **none** encryption (no encryption required) is supported by all types of S3 (non-Azure) object store servers. **SSE-S3** encryption is supported by and is a default for all types of S3 (non-Azure) object store servers except ONTAP\_S3. This is an advanced property. In most cases it is best not to change default value of "sse\_s3" for object store servers which support SSE-S3 encryption. The encryption is in addition to any encryption done by ONTAP at a volume or at an aggregate level.

**[-url-style {path-style | virtual-hosted-style}] - URL Style Used to Access S3 Bucket**

This parameter specifies the URL style used to access S3 bucket. This option is only available for non-Azure object store providers. The available choices and default value depend on provider-type.

## Examples

The following example creates an object store configuration in Data ONTAP:

```
cluster1::>storage aggregate object-store config create -object-store-name
  my_aws_store -provider-type AWS_S3 -server s3.amazonaws.com
  -container-name my-aws-bucket -access-key DXJRXHPXHYXA9X31X3JX
```

## Related Links

- [storage aggregate object-store config modify](#)

# storage aggregate object-store config delete

Delete the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store config delete** command removes an existing object store configuration in Data ONTAP. The configuration cannot be deleted if it is used by any aggregates or if the system is still freeing objects from the object store from a previously executed **storage aggregate delete** command. The command **storage aggregate object-store show** can be used to view the aggregates attached to the object store before issuing the delete command.

The **storage aggregate object-store show** command will not display aggregates that have been previously deleted but still has objects in the object store.

## Parameters

**-object-store-name <text>** - Object Store Configuration Name

This parameter specifies the object store configuration to be deleted.

## Examples

The following example deletes an object store configuration named my-store:

```
cluster1::>storage aggregate object-store config delete -object-store-name my-store
```

## Related Links

- [storage aggregate delete](#)
- [storage aggregate object-store show](#)

# storage aggregate object-store config modify

Modify object store configuration attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store config modify** command is used to update one or more of object store configuration parameters. This command must not be used to reassociate an existing

valid object-store configuration to a new object-store or container. The modifiable parameters include object store name, server name, port, access\_key, secret-password, ipspace and is-ssl-enabled.

## Parameters

### **-object-store-name <text> - Object Store Configuration Name**

This parameter identifies the configuration to be modified.

### **[-new-object-store-name <text>] - Object Store Configuration New Name**

This optional parameter specifies the new name for the object store configuration.

### **[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

This optional parameter specifies where the system obtains credentials for authentication to an object store. The available choices depend on the platform (Cloud Volumes ONTAP or not) and provider-type (AWS\_S3 or not). The **keys** value is always applicable, and if selected means that the **access-key** and **secret-password** are provided by the system administrator. In Cloud Volumes ONTAP, the **EC2-IAM** value is also applicable. It means that the IAM role is associated with the EC2 instance, and that the **access-key**, **secret-password** and session token are retrieved from EC2 instance metadata for this IAM role. Note that **-use-iam-role** and **-auth-type** are mutually exclusive, **-auth-type EC2-IAM** is an equivalent of **-use-iam-role true**, and **-auth-type key** is an equivalent of **-use-iam-role false**. In Cloud Volumes ONTAP, the **GCP-SA** value may also be applicable. It means that a session token is retrieved from the GCP instance metadata for the Service Account associated with the GCP instance. Similarly, **Azure-MSI** means that a session token is retrieved from the Azure instance metadata for the Managed Service Identity (MSI) associated with the Azure instance. For the **AWS\_S3** provider, the **CAP** (C2S Authentication Portal) value is also applicable. This should only be used when accessing C2S (Commercial Cloud Services). If the **CAP** value is specified, then the `-cap-url` must be specified. See `cap-url`.

### **[-cap-url <text>] - URL to Request Temporary Credentials for C2S Account**

This parameter is available only when **-auth-type** is **CAP**. It specifies a full URL of the request to a CAP server for retrieving temporary credentials (access-key, secret-password and session token) for accessing the object store server. The CAP URL may look like: <https://123.45.67.89:1234/CAP/api/v1/credentials?agency=myagency=mission=myrole>

### **[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server**

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server. For Amazon S3, server name must be an AWS regional endpoint in the format `s3.amazonaws.com` or `s3-<region>.amazonaws.com`, for example, `s3-us-west-2.amazonaws.com`. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the **-server** is a "blob.core.windows.net" or a "blob.core.usgovcloudapi.net", then the value of `azure-account` in the configuration followed by a period will be added in front of the server. Note that the value of **azure-account** cannot be modified.

### **[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

This optional parameter indicates whether a secured SSL/TLS connection will be used during data

access to the object store.

#### **[-port <integer>] - Port Number of the Object Store**

This optional parameter specifies a new port number to connect to the object store server indicated in the **-server** parameter.

#### **[-access-key <text>] - Access Key ID for S3 Compatible Provider Types**

This optional parameter specifies a new access key (access key ID) for the AWS S3, SGWS, IBM COS object stores and ONTAP S3.

#### **[-secret-password <text>] - Secret Access Key for S3 Compatible Provider Types**

This optional parameter specifies a new password (secret access key) for the AWS S3, SGWS, IBM COS object stores and ONTAP S3. For an Azure object store see **-azure-private-key** . If the **-access-key** is specified but the **-secret-password** is not then one will be asked to enter the **-secret-password** without echoing the input.

#### **[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing**

If this optional parameter is true then one will be asked to enter the **-azure-private-key** without echoing the input.

#### **[-azure-private-key <text>] - Azure Access Key**

This optional parameter specifies a new access key for Azure object store. For other object store providers see **secret-password** . See also **ask-azure-private-key** .

#### **[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

This optional parameter specifies new ipspace values for the configuration.

#### **[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

This optional parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when **is-ssl-enabled** is **true** . It is recommended to keep the default value which is **true** to make sure that Data ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

#### **[-use-http-proxy {true|false}] - Use HTTP Proxy**

This optional parameter indicates whether an HTTP proxy will be used for connecting to an object store. Note that an HTTP proxy is configured using the **vserver http-proxy** commands at the **diagnostic** privilege level.

#### **[-server-side-encryption {none | SSE-S3}] - Encryption of Data at Rest by the Object Store Server**

This parameter specifies if AWS or other S3 compatible object store server must encrypt data at rest. The available choices depend on provider-type. **none** encryption (no encryption required) is supported by all S3 (non-Azure) object store servers. **SSE-S3** encryption is supported by all S3 (non-Azure) object store servers except ONTAP\_S3. This is an advanced property. In most cases it is best not to change default value of "sse\_s3" for object store servers which support SSE-S3 encryption. The encryption is in addition to any encryption done by ONTAP at a volume or at an aggregate level. Note that changing this option does not change encryption of data which

already exist in the object store.

### **[-url-style {path-style | virtual-hosted-style}] - URL Style Used to Access S3 Bucket**

This parameter specifies the URL style used to access S3 bucket. This option is only available for non-Azure object store providers. The available choices and default value depend on provider-type.

## Examples

The following example modifies two parameters (port number and is-ssl-enabled) of an object store configuration named my-store:

```
cluster1::>storage aggregate object-store config modify -object-store-name my-store  
-port 1235 -is-ssl-enabled true
```

# storage aggregate object-store config rename

Rename an existing object store configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `'storage aggregate object-store config rename'` command is used to rename an exiting object store configuration.

## Parameters

**-object-store-name <text> - Object Store Configuration Name**

This paramter identifies an existing object store configuration.

**-new-object-store-name <text> - Object Store Configuration New Name**

This parameter specifies the new object store configuration name.

## Examples

The following example renames an object store configuration from my-store to ms1:

```
cluster1::>storage aggregate object-store config rename -object-store-name my-store  
-new-object-store-name ms1
```

# storage aggregate object-store config show

Display a list of object store configurations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate object-store config show** command displays information about all existing object store configurations in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-object-store-name <text>] - Object Store Configuration Name**

If this parameter is specified, the command displays information only about object store configurations whose name matches the specified names.

**[-object-store-uuid <UUID>] - UUID of the Object Store Configuration**

If this parameter is specified, the command displays information only about object store configurations whose UUID matches the specified UUID values.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose authentication type matches the specified value.

**[-cap-url <text>] - URL to Request Temporary Credentials for C2S Account**

If this parameter is specified, the command displays information only about object store configurations whose CAP URL matches the specified value.

**[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server**

If this parameter is specified, the command displays information only about object store configurations whose server name matches the specified value. The server name is specified as a Fully Qualified Domain Name (FQDN).

**[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

If this parameter is specified, the command displays information only about object store configurations whose status about the use of secured communication over the network matches the specified value.

**[-port <integer>] - Port Number of the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose port numbers matches the specified value.

**[-container-name <text>] - Data Bucket/Container Name**

If this parameter is specified, the command displays information only about object store configurations whose container name matches the specified value. Data ONTAP uses this container name or object store data bucket while accessing data from the object store.

**[-access-key <text>] - Access Key ID for S3 Compatible Provider Types**

If this parameter is specified, the command displays information only about AWS S3, SGWS, IBM COS object store configurations and ONTAP S3 whose access key matches the specified value. Data ONTAP requires the access key for authorized access to the object store.

**[-azure-account <text>] - Azure Account**

If this parameter is specified, the command displays information only about Azure object store configurations whose account matches the specified value. Data ONTAP requires the Azure account for authorized access to the Azure object store.

**[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose IPspace matches the specified value. Data ONTAP uses the IPspace value to connect to the object store.

**[-iam-role <text>] - IAM Role for AWS Cloud Volumes ONTAP**

If this parameter is specified, the command displays information only about object store configurations whose IAM (Identity and Access Management) role matches the specified value.

**[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

If this parameter is specified, the command displays information only about object store configurations whose status about the validation of SSL/TLS certificate matches the specified value.

**[-use-http-proxy {true|false}] - Use HTTP Proxy**

If this parameter is specified, the command displays information only about object store configurations for which usage of HTTP proxy matches the specified value.

**[-cluster <Cluster name>] - The Name of the Cluster to which the Configuration Belongs**

If this parameter is specified, the command displays information only about object store configurations for which cluster matches the specified value.

**[-server-side-encryption {none | SSE-S3}] - Encryption of Data at Rest by the Object Store Server**

If this parameter is specified, the command displays information only about object store configurations whose server-side encryption matches the specified value.

**[-url-style {path-style | virtual-hosted-style}] - URL Style Used to Access S3 Bucket**

If this parameter is specified, the command displays information only about object store configurations whose URL style matches the specified value.

## Examples

The following example displays all available object store configuration in the cluster:

```
cluster1::>storage aggregate object-store config show
```

# storage aggregate object-store profiler abort

Abort object store profiler

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate object-store profiler abort** command will abort an ongoing object store profiler run. This command requires two parameters - an object store configuration and a node on which the profiler is currently running.

## Parameters

**-node {<nodename>|local} - Node on Which the Profiler Should Run**

This parameter specifies the node on which the object store profiler is running.

**-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

## Examples

The following example aborts the object store profiler :

```
cluster1::>storage aggregate object-store profiler abort -object-store-name my-store  
-node my-node
```

# storage aggregate object-store profiler show

Show object store profiler status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate object-store profiler show** command is used to monitor progress and results of the storage aggregate object-store profiler start command.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node Name**

If this parameter is specified, the command only displays information corresponding to the specified node.

**[-object-store-name <text>] - ONTAP Name for this Object Store Configuration**

If this parameter is specified, the command only displays information about the objects which are placed on the specified object store.

**[-object-name-prefix <UUID>] - Bin UUID**

If this parameter is specified, the command displays information about all the objects whose object names are prefixed with the specified object name prefix. Objects from two different object stores will not have the same object name prefix.

**[-object-prefix <text>] - Prefix Added to Each Object**

If this parameter is specified, the command only displays information about the objects which have the specified prefix. Objects belonging to two different object stores can have the same object prefix.

**[-profiler-status <text>] - Profiler Status**

If this parameter is specified, the command only displays information corresponding to the specified node.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Profiler Start Time**

If this parameter is specified, the command only displays information corresponding to the specified start time of the profiler run.

**[-op-name <text>] - Operation Name - PUT/GET**

If this parameter is specified, the command only displays information corresponding to the specified operation name. Possible values are PUT or GET.

**[-op-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Operation**

If this parameter is specified, the command only displays information corresponding to the specified size of the operation.

**[-op-count <integer>] - Number of Operations Performed**

If this parameter is specified, the command only displays information corresponding to the specified node.

**[-op-failed <integer>] - Number of Operations Failed**

If this parameter is specified, the command only displays information corresponding to the specified node.

**[-op-latency-minimum <integer>] - Minimum Latency for Operation in Milliseconds**

If this parameter is specified, the command only displays information corresponding to the specified minimum latency for the operation. The values are in milliseconds.

**[-op-latency-maximum <integer>] - Maximum Latency for Operation in Milliseconds**

If this parameter is specified, the command only displays information corresponding to the specified maximum latency for the operation. The values are in milliseconds.

**[-op-latency-average <integer>] - Average Latency for Operation in Milliseconds**

If this parameter is specified, the command only displays information corresponding to the specified average latency for the operation. The values are in milliseconds.

**[-op-throughput {<integer>[KB|MB|GB|TB|PB]}] - Throughput per Second for the operation**

If this parameter is specified, the command only displays information corresponding to the specified throughput for the operation.

**[-op-errors <text>, ...] - Error Reasons and Count**

If this parameter is specified, the command only displays information corresponding to the count and specified reason for error.

**[-op-latency-histogram <text>, ...] - Latency Histogram**

If this parameter is specified, the command only displays information corresponding to the specified latency histogram for the operation.

## Examples

The following example displays the results of [storage aggregate object-store profiler start](#) :

```
cluster1::>storage aggregate object-store profiler show
```

## Related Links

- [storage aggregate object-store profiler start](#)

# storage aggregate object-store profiler start

Start the object store profiler to measure latency and throughput

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate object-store profiler start** command writes objects to an object store and reads those objects to measure latency and throughput of an object store. This command requires two parameters - an object store configuration and node from which to send the PUT/GET/DELETE operations. This command verifies whether the object store is accessible through the intercluster LIF of the node on which it runs. The command fails if the object store is not accessible. The command will create a 10GB dataset by doing 2500 PUTs for a maximum time period of 60 seconds. Then it will issue GET operations of different sizes - 4KB, 8KB, 32KB, 256KB for a maximum time period of 180 seconds. Finally it will delete the objects it created. This command can result in additional charges to your object store account. This is a CPU intensive command. It is recommended to run this command when the system is under 50% CPU utilization.

## Parameters

**-node {<nodename>|local}** - Node on Which the Profiler Should Run

This parameter specifies the node from which PUT/GET/DELETE operations are sent.

**-object-store-name <text>** - Object Store Configuration Name

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

**[-object-prefix <text>]** - Prefix Added to Each Object

This parameter specifies the prefix attached to each object. There is a prefix length restriction of 80 characters. In addition to this restriction, follow any specific prefix length or character restrictions that are imposed by the cloud store they plan to run this command. Refer to the respective cloud store documentation for details.

## Examples

The following example starts the object store profiler :

```
cluster1::>storage aggregate object-store profiler start -object-store-name my-store
```

```
-node my-node
```

# storage aggregate object-store put-rate-limit modify

Modify the maximum, per node, FabricPool put rate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate object-store put-rate-limit modify** command enables the modification of values that can be used to limit the FabricPool put rate or to allow it to run more aggressively. Use the **storage aggregate object-store put-rate-limit show** command to display the current maximum put rate, if any, in effect.

## Parameters

**-node {<nodename>|local}** - Node Name

This parameter specifies the Node name.

**[-default {true|false}]** - Set Default Values

Setting this field to true will reset the put-rate-limit to the system default.

**[-put-rate-bytes-limit {<integer>[KB|MB|GB|TB|PB]}]** - Limit Max (B/s) Allowed

This field is the maximum put rate in bytes per second. The field can be used to reduce the put rate to an object store.

## Related Links

- [storage aggregate object-store put-rate-limit show](#)

# storage aggregate object-store put-rate-limit show

Display the per node FabricPool Put Rate Limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage aggregate object-store put-rate-limit show** command displays the maximum put rate

for FabricPool.

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This parameter specifies the Node name.

**[-put-rate-bytes-limit {<integer>[KB|MB|GB|TB|PB]}] - Put Rate Limit (B/s)**

This field represents an upper boundary on the allowed put rate. The put rate will not be allowed to exceed this value but can be throttled to values less than it to accommodate client operations and a high average system CPU. Some platforms are intentionally configured with a lower maximum put rate in an effort to reduce the impact of the FabricPool put subsystem on the overall system health. A limit in effect, lower than the default, may keep cold data in the performance tier for a long period of time and may require an increase in space requirements. A value of -1 indicates no upper bound is in effect.

**[-put-rate {<integer>[KB|MB|GB|TB|PB]}] - Estimated Put Rate (B/s)**

The **put-rate** displays the maximum computed bytes per second the put subsystem assumes is possible. This put rate is measured in real-time and is in relation to the node for all attached object stores which have put traffic to them.

**[-max-put-rate-in-effect {<integer>[KB|MB|GB|TB|PB]}] - Current Maximum Put Rate In Effect (B/s)**

This field displays the maximum allowed put rate. If it is less than the **max-throughput** then it indicates that throttling is in effect. The throttling is the outcome of either staying at **put-rates-byte-limit** or an effort to accommodate client operations on a system with high CPU.

**[-max-throughput {<integer>[KB|MB|GB|TB|PB]}] - Estimated Maximum Throughput (B/s)**

This field displays the maximum put throughput rate in bytes per second that the put subsystem will throttle down from or up to. It's the greater of the **put-rate** and the node default value.

## storage aggregate plex delete

Delete a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate plex delete** command deletes the specified plex. The aggregate specified with then **-aggregate** will be unmirrored and contain the remaining plex. The disks in the deleted plex become spare disks.

## Parameters

**-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the **-plex** parameter.

**-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the **-aggregate** parameter.

## Examples

The following example deletes plex0 of aggregate aggr1:

```
cluster1::> storage aggregate plex delete -aggregate aggr1 -plex plex0
```

# storage aggregate plex offline

Offline a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate plex offline** command takes the specified plex offline. The aggregate specified with the **-aggregate** parameter must be a mirrored aggregate and both plexes must be online. Prior to taking a plex offline, the system will flush all internally-buffered data associated with the plex and create a snapshot that is written out to both plexes. The snapshot allows for efficient resynchronization when the plex is subsequently brought back online.

## Parameters

**-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the **-plex** parameter.

**-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the **-aggregate** parameter.

## Examples

The following example takes plex0 of aggregate aggr1 offline:

```
cluster1::> storage aggregate plex offline -aggregate aggr1 -plex plex0
```

## storage aggregate plex online

Online a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate plex online** command brings the specified plex online. The aggregate specified with the **-aggregate** parameter must be an online mirrored aggregate. The system will initiate resynchronization of the plex as part of online processing.

## Parameters

**-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the **-plex** parameter.

**-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the **-aggregate** parameter.

## Examples

The following example brings plex0 of aggregate aggr1 online:

```
cluster1::> storage aggregate plex online -aggregate aggr1 -plex plex0
```

## storage aggregate plex show

Show plex details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate plex show** command displays information for the specified plex. By default, the command displays the following information about all plexes:

- Aggregate Name
- Plex Name
- Is Online
- Is Resyncing
- Resyncing Percentage
- Plex Status

To display detailed information about a single plex, use the **-aggregate** and **-plex** parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

Name of an existing aggregate which contains the plex specified with the **-plex** parameter.

**[-plex <text>] - Plex Name**

Name of a plex which belongs to the aggregate specified with the **-aggregate** parameter.

**[-status <text>] - Status**

Displays plex status. Possible values are:

- **normal**
- **failed**
- **empty**
- **invalid**
- **uninitialized**
- **failed assimilation**
- **limbo**
- **active**
- **inactive**
- **resyncing**

These values may appear by themselves or in combination separated by commas, for example, **"normal,active"**.

**[-is-online {true|false}] - Is Online**

Selects the plexes that match this parameter value.

**[-in-progress {true|false}] - Resync is in Progress**

Selects the plexes that match this parameter value.

**[-resyncing-percent <percent>] - Resyncing Percentage**

Selects the plexes that match this parameter value.

**[-resync-level <integer>] - Resync Level**

Selects the plexes that match this parameter value.

**[-pool <integer>] - Pool**

Selects the plexes that match this parameter value.

## Examples

The following example displays information about all the plexes for all the aggregates:

```
cluster1::> storage aggregate plex show
Aggregate Plex      Is Online  Is Resyncing  Resyncing Percent Status
-----
aggr0    plex0    true      false        - normal,active
aggr1    plex0    true      false        - normal,active
aggr1    plex1    true      false        - normal,active
aggr2    plex0    true      false        - normal,active
aggr2    plex2    true      false        - normal,active
5 entries were displayed.
```

The following example displays information about plex1 of aggregate aggr1:

```
cluster1::> storage aggregate plex show -aggregate aggr1 -plex plex1
Aggregate: aggr1
    Plex Name: plex1
    Status: normal,active
    Is Online: true
Resync is in Progress: false
Resyncing Percentage: -
Resync Level: -
Pool: 1
```

# storage aggregate reallocation quiesce

Quiesce reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the [storage aggregate reallocation restart](#) command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced (paused) state.

## Parameters

**-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to temporarily pause the job.

## Examples

```
cluster1::> storage aggregate reallocation quiesce
             -aggregate aggr0
```

Temporarily stops (pauses) any reallocation job running on aggregate aggr0.

## Related Links

- [storage aggregate reallocation restart](#)

# storage aggregate reallocation restart

Restart reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Starts a reallocation job. Use this command to restart a quiesced (temporarily stopped) job or a scheduled scan that is idle for the aggregate.

## Parameters

**-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to restart reallocation scans.

**[-i, -ignore-checkpoint <true>] - Ignore Checkpoint**

Restarts the job at the beginning when set to true. If you use this command without specifying

this parameter, its effective value is false and the job starts the scan at the point where it was stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

## Examples

```
cluster1::> storage aggregate reallocation restart
  -aggregate aggr0 -ignore-checkpoint true
```

Restarts reallocation job on aggregate aggr0 from the beginning.

# storage aggregate reallocation schedule

Modify schedule of reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the [storage aggregate reallocation start](#) command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the [storage aggregate reallocation start](#) command.

## Parameters

**-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to schedule reallocation jobs.

**[-d, -del <true>] - Delete**

Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

**[-s, -cron <text>] - Cron Schedule**

Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of week is a value from 0 (Sunday) to 6 (Saturday).

- day of month is a value from 1 to 31.

If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

Use an asterisk "\*" as a wildcard to indicate every value for that field. For example, an \* in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

## Examples

```
cluster1::> storage aggregate reallocation schedule -aggregate aggr0 -cron "0 23 6 *"
```

Schedules a reallocation job to run at 11:00 p.m. every Saturday on aggr0.

## Related Links

- [storage aggregate reallocation start](#)

# storage aggregate reallocation show

Show reallocate job status for improving free space layout

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Displays the status of a reallocation scan, including the state, schedule, aggregate and scan id. If you do not specify the **id** for a particular reallocation scan, the command displays information about all the existing reallocation scans.

## Parameters

{ [-fields <fieldname>, ...]

Displays the value of relevant field that you specify for the reallocation scans that are present.

[-v ]

Specify this parameter to display the output in a verbose format.

[-instance ] }

Displays information about reallocation scans on aggregates in a list format.

[-id <integer>] - Job ID

Specify this parameter to display the reallocation scan that matches the reallocation job ID that you specify.

**[-aggregate <aggregate name>] - Aggregate Name**

Specify this parameter to display the reallocation scan that matches the aggregate that you specify.

**[-description <text>] - Job Description**

Specify this parameter to display reallocation scans that match the text description that you specify.

**[-state**

**{Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Job State**

Specify this parameter to display reallocation jobs that match the state that you specify.

**[-progress <text>] - Execution Progress**

Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all the jobs that are starting.

**[-schedule <job\_schedule>] - Schedule Name**

Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the [job schedule show](#) command.

**[-global-status <text>] - Global State of Scans**

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

- "Reallocation scans are on"
- "Reallocation scans are off"

## Examples

```
cluster1::> storage aggregate reallocation show
Job ID          Aggregate          Schedule          State
-----          -
23              aggr0              reallocate_0 23 * 6  Queued
```

Displays the job ID, aggregate, schedule, and state for the reallocation scans.

## Related Links

- [job schedule show](#)

# storage aggregate reallocation start

Start reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Begins a reallocation scan on a specified aggregate.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the aggregate.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the [storage aggregate reallocation schedule](#) command to schedule reallocation jobs.

## Parameters

**-aggregate <aggregate name> - Aggregate Name**

Specify this parameter to specify the target aggregate on which to start a reallocation scan.

**{ [-i, -interval <text>] - Interval Schedule**

Specified the schedule in a single string with four fields:

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of month is a value from 1 to 31.

If you specify 31 as the value for the day of the month, reallocation scans will not run in any of the months with fewer than 31 days.

- day of the week is a value from 0 (Sunday) to 6 (Saturday).

Use an asterisk "\*" as a wildcard to indicate every value for that field. For example, an \* in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

**{ [-o, -once <>true>] - Once }**

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

## Examples

```
cluster1::> storage aggregate reallocation start -aggregate aggr0 -interval "0 23 * 6"
```

Starts a reallocation job on aggregate aggr0 at 11:00 p.m. every Saturday.

## Related Links

- [storage aggregate reallocation schedule](#)

# storage aggregate reallocation stop

Stop reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Stops and deletes any reallocation scan running on the specified aggregate. This command stops and deletes in-progress, scheduled, and quiesced scans.

## Parameters

**-aggregate <aggregate name> - Aggregate Name**

Specify this parameter to specify the target aggregate on which to stop and delete a reallocation scan.

## Examples

```
cluster1::> storage aggregate reallocation stop -aggregate aggr0
```

Stops and deletes the reallocation scan on aggregate aggr0.

# storage aggregate relocation show

Display relocation status of an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate relocation show** command displays status of aggregates which were relocated in the last instance of relocation operation.

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command only displays the fields that you specify.

**[`-instance`] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[`-node` {<nodename>|local}] - Node**

Selects aggregates from the specified source node.

**[`-aggregate` <text>] - Aggregate Name**

Selects the aggregates that match this parameter value.

**[`-relocation-status` <text>] - Aggregates Relocation Status**

Selects the aggregates whose relocation status matches this parameter value.

**[`-destination` <text>] - Destination for Relocation**

Selects the aggregates that are designated for relocation on the specified destination node.

## Examples

The following example displays the relocation status of aggregates on all nodes in the cluster:

```
cluster1::> storage aggregate relocation show
Source          Aggregate  Destination  Relocation Status
-----
node0
-              -              -              Not attempted yet
node1
aggr1          node0       Done
aggr2          node0       In progress
aggr3          node0       Not attempted yet
4 entries were displayed.
```

## storage aggregate relocation start

Relocate aggregates to the specified destination

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage aggregate relocation start** command initiates the relocation of the aggregates from one node to the partner node in a high-availability (HA) pair.

### Parameters

**-node {<nodename>|local} - Name of the Node that currently owns the aggregate**

This specifies the source node where the aggregates to be relocated reside.

**-destination {<nodename>|local} - Destination node**

This specifies the destination node where aggregates are to be relocated.

**-aggregate-list <aggregate name>, ... - List of Aggregates to be relocated**

This specifies the list of aggregate names to be relocated from source node to destination node.

**[-override-vetoes {true|false}] - Override Vetoes**

This specifies whether to override the veto checks for relocation operation. Initiating aggregate relocation with vetoes overridden will result in relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive. The default value is false.

**[-relocate-to-higher-version {true|false}] - Relocate To Higher Version**

This specifies if the aggregates are to be relocated to a node which is running on a higher version of Data ONTAP than the source node. If an aggregate is relocated to this destination then that aggregate cannot be relocated back to the source node till the source is also upgraded to the same or higher Data ONTAP version. This option is not required if the destination node is running on higher minor version, but the same major version. The default value is false.

**[-override-destination-checks {true|false}] - Override Destination Checks**

This specifies if the relocation operation should override the check done on destination node. This option could be used to force a relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive. The default value is false.

**[-ndo-controller-upgrade {true|false}] - Relocate Aggregates for NDO Controller Upgrade**

This specifies if the relocation operation is being done as a part of non-disruptive controller upgrade process. Aggregate relocation will not change the home ownerships of the aggregates while relocating as part of controller upgrade. The default value is false.

## Examples

The following example relocates aggregates name aggr1 and aggr2 from source node node0 to destination node node1:

```
cluster1::> storage aggregate relocation start -node node0 -destination node1
-aggregate-list aggr1, aggr2
```

## storage aggregate resynchronization modify

Modify aggregate resynchronization priorities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate resynchronization modify` command can be used to modify the resynchronization priority of an aggregate.

When the number of aggregates pending resynchronization is higher than the maximum number of concurrent resynchronization operations allowed on a node, the aggregates get resynchronized in the order of their "`resync-priority``" values.

For example, let the `max-concurrent-resync` under the `storage aggregate resynchronization options` directory for a node be set to two. If there are three aggregates waiting to be resynchronized, where their respective `resync-priority` values are `high`, `medium`, and `low`, then the third aggregate is not allowed to start resynchronization until one of the first two aggregates has completed resynchronizing.

## Parameters

### `-aggregate <aggregate name>` - Aggregate

This parameter specifies the aggregate that is to be modified.

### `[-resync-priority {high(fixed)|high|medium|low}]` - Resynchronization Priority

This parameter specifies the new resynchronization priority value for the specified aggregate. This field cannot be modified for unmirrored or Data ONTAP system aggregates.

Possible values for this parameter are:

- `high`: Mirrored data aggregates with this priority value start resynchronization first.
- `medium`: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- `low`: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

## Examples

The following example changes the `resync-priority` of a specified aggregate to `medium`:

```
cluster1::> storage aggregate resynchronization modify -aggregate aggr1 -resync
-priority medium
```

## storage aggregate resynchronization show

Display aggregate resynchronization priorities

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

## Description

The **storage aggregate resynchronization show** command displays the relative resynchronization priority for each aggregate in the cluster. When a particular node restricts how many resync operations can be active concurrently, these priorities are used to prioritize the operations. The maximum concurrent resync operations for a node is displayed in the [storage aggregate resynchronization options show](#) command. If no parameters are specified, the command displays the following information about all the aggregates in the cluster:

- Aggregate name
- Node that owns the aggregate
- Resync priority for the aggregate

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -aggregate <aggregate name> ] - Aggregate**

If this parameter is specified, the command displays the resynchronization priority only for the specified aggregate.

**[ -node {<nodename>|local} ] - Node**

If this parameter is specified, the command displays the resynchronization priority only for the aggregates owned by the specified node.

**[ -resync-priority {high(fixed)|high|medium|low} ] - Resynchronization Priority**

If this parameter is specified, the command displays only the resynchronization priority that matches the specified value. Possible values for this parameter are:

- **high(fixed)**: This value is reserved for Data ONTAP system aggregates, which cannot have any other value for this field. These aggregates always start their resynchronization operation at the first available opportunity. This value cannot be assigned to a data aggregate.
- **high**: Mirrored data aggregates with this priority value start resynchronization first.
- **medium**: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- **low**: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

When the number of aggregates waiting for resynchronization is higher than the maximum

number of resynchronization operations allowed on a node, then the `resync-priority` field is used to determine which aggregate starts resynchronization first. This field is not set for unmirrored aggregates.

## Examples

The following command displays the resynchronization priorities for all the aggregates in the cluster:

```
cluster1::> storage aggregate resynchronization show
Aggregate Node           Resync Priority
-----
aggr0_n1 cluster1-01      high(fixed)
aggr0_n2 cluster1-02      high(fixed)
aggr1   cluster1-01      low
aggr2   cluster1-01      high
aggr3   cluster1-01      medium
4 entries were displayed.
```

## Related Links

- [storage aggregate resynchronization options show](#)

# storage aggregate resynchronization options modify

Modify node specific aggregate resynchronization options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate resynchronization options modify** command can be used to modify the options that govern the resynchronization of aggregates on a given cluster node.

Modifying the **max-concurrent-resyncs** option changes the number of aggregates that are allowed to resynchronize concurrently. When the number of aggregates waiting for resynchronization is higher than this value, the aggregates are resynchronized in the order of their "`resync-priority`". This value can be modified using the [storage aggregate resynchronization modify](#) command while specifying the `-resync-priority` parameter.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node for which the option is to be modified.

## **[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates**

This parameter specifies the new value for the maximum number of concurrent resync operations allowed on a node. This option must be specified along with the **-node** parameter. When a node has active resync operations, setting this parameter to a value that is lower than the number of currently resyncing aggregates will trigger a user confirmation.

## Examples

The following example changes the maximum concurrent resync operations for the specified node to **ten** :

```
cluster1::> storage aggregate resynchronization options modify -node node1 -max
-concurrent-resyncs 10
```

## Related Links

- [storage aggregate resynchronization modify](#)

# storage aggregate resynchronization options show

Display node specific aggregate resynchronization options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage aggregate resynchronization options show** command displays all the options that govern the resynchronization of aggregates on a given cluster node. If no parameters are specified, the command displays the following information about all nodes:

- Node for which the information is being displayed
- Maximum number of concurrent resynchronizing aggregates allowed

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**{ [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays resynchronization options only for the specified node.

**[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates**

If this parameter is specified, the command displays only the resynchronization option that matches the specified value.

## Examples

The following example displays the maximum number of concurrent resyncs allowed for each node in the cluster:

```
cluster1::> storage aggregate resynchronization options show
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
cluster1-02    4
2 entries were displayed.
```

The following example displays the maximum number of concurrent resyncs allowed for a specified node:

```
cluster1::> storage aggregate resynchronization options show -node node1
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
```

The following example displays all the nodes that allow more than five concurrent resync operations:

```
cluster1::> storage aggregate resynchronization options show -max-concurrent-resyncs
>5
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
```

## storage array modify

Make changes to an array's profile.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array modify` command lets the user change several array parameters.

## Parameters

### `-name <text>` - Name

Storage array name, either generated by Data ONTAP or assigned by the user.

### `[-prefix <text>]` - Prefix

Abbreviation for the named array.

### `[-vendor <text>]` - Vendor

Array manufacturer.

### `[-model <text>]` - Model

Array model number.

### `[-options <text>]` - options

Vendor specific array settings.

### `[-max-queue-depth <integer>]` - Target Port Queue Depth

The target port queue depth for all target ports on this array.

### `[-lun-queue-depth <integer>]` - LUN Queue Depth

The queue depth assigned to array LUNs from this array.

### `{ [-is-upgrade-pending {true|false}] }` - Upgrade Pending

Set this parameter to **true** if the array requires additional Data ONTAP resilience for a pending firmware upgrade. Keep this parameter **false** during normal array operation. This value can not be set to **true** if `-path-faliover-time` is greater than zero.

### `[-path-failover-time <integer>]` - Path Failover Time (sec)

The time delay (in secs) before switching the I/O path when the path is deleted. The maximum time delay is 30 sec. The default is 0. This value can not be greater than zero if `-is-upgrade-pending` is **true**.

### `[-all-path-fail-delay <integer>]` - Extend All Path Failure Event (secs)

Use this parameter to increase the delay before Data ONTAP declares an "all path failure" event for an array. Delaying the "all path failure" event allows Data ONTAP to suspend I/O operations for a longer period of time before declaring a data access disruption, allowing for I/O operations to resume if any path comes back online within the specified duration. A valid delay is any value between 30 and 90 seconds. A value of 0 will reset the delay, resulting in default actions being taken whenever an "all path failure" event is detected.

## Examples

This command changes the model to FastT.

```
cluster1::> storage array modify -name IBM_1722_1 -model FastT
```

## storage array remove

Remove a storage array record from the array profile database.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage array remove** command discards array profile records for a particular storage array from the cluster database. The command fails if a storage array is still connected to the cluster. Use the [storage array config show](#) command to view the array connectivity status. The array target port can be removed using the [storage array port remove](#) command.

## Parameters

**-name <text> - Name**

Name of the storage array you want to remove from the database.

## Examples

```
cluster1::> storage array remove IBM_1722_1
```

## Related Links

- [storage array config show](#)
- [storage array port remove](#)

## storage array rename

Change the name of a storage array in the array profile database.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage array rename** command permits substitution of the array profile name which Data ONTAP assigned during device discovery. By default, the name that Data ONTAP assigned to the storage array during discovery is shown in Data ONTAP displays and command output.

## Parameters

**-name <text> - Name**

Storage array name either generated by Data ONTAP or assigned by the user.

**-new-name <text> - The new name to assign to this array profile. (28 chars max)**

New name to assign to the storage array.

## Examples

```
cluster1::> storage array rename -name HITACHI_DF600F_1 -new-name MyArray
```

## storage array show

Display information about SAN-attached storage arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage array show** command displays information about arrays visible to the cluster. If no parameters are specified, the command displays the following information about all storage arrays:

- Prefix
- Name
- Vendor
- Model
- Options

To display detailed information about a single array, use the `'-name'` parameter. The detailed view adds the following information:

- Serial Number
- Optimization Policy
- Affinity

- Errors
- Path Failover Time
- Extend All Path Failure Event

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -name <text> ] - Name**

Selects the arrays that match this parameter value.

**[ -prefix <text> ] - Prefix**

Abbreviation for the named array.

**[ -vendor <text> ] - Vendor**

Array manufacturer.

**[ -model <text> ] - Model**

Array model number.

**[ -options <text> ] - options**

Vendor specific array settings.

**[ -serial-number <text> ] - Serial Number**

Array product identifier.

**[ -max-queue-depth <integer> ] - Target Port Queue Depth**

Selects the arrays that match this parameter value.

**[ -lun-queue-depth <integer> ] - LUN Queue Depth**

Selects the arrays that match this parameter value.

**[ -optimization-policy { iALUA|eALUA|symmetric|proprietary|mixed|unknown } ] - Optimization Policy**

Selects the arrays that match this parameter value.

**[ -affinity { none|aaa|ap|mixed|unknown } ] - Affinity**

Selects the arrays that match this parameter value.

**[ -error-text <text>, ... ] - Error Text**

Selects the arrays that match this parameter value.

**[-is-upgrade-pending {true|false}] - Upgrade Pending**

Selects the arrays that match this parameter value.

**[-path-failover-time <integer>] - Path Failover Time (sec)**

Use this parameter to list arrays that have path failover time set to the value you specify.

**[-all-path-fail-delay <integer>] - Extend All Path Failure Event (secs)**

Use this parameter to list arrays that have the all path failure event delay set to the value you specify.

## Examples

The following example displays information about all arrays.

```
cluster1::> storage array show
Prefix                Name      Vendor      Model Options
-----
                HITACHI_DF600F_1  HITACHI      DF600F
                IBM_1722_1        IBM          1722
2 entries were displayed.
```

The following example displays detailed information about a specific array:

```
cluster1::> storage array show -name HITACHI_DF600F_1
Name: HITACHI_DF600F_1
                Prefix: abc
                Vendor: HITACHI
                Model: DF600F
                options:
                Serial Number: 4291000000000000
                Optimization Policy: iALUA
                Affinity: aaa
                Error Text:
                Path Failover Timeout (sec): 30
                Extend All Path Failure Event (secs): 50
```

## storage array config show

Display connectivity to back-end storage arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage array config show** command displays information about how the storage arrays connect

to the cluster, LUN groups, number of LUNS, and more. Use this command to validate the configuration and to assist in troubleshooting.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -switch ]**

If you specify this parameter, switch port information is shown.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Controller Name**

Selects the arrays that match this parameter value.

**[ -group <integer> ] - LUN Group**

Selects the arrays that match this parameter value. A LUN group is a set of LUNs that shares the same path set.

**[ -target-wwpn <text> ] - Array Target Ports**

Selects the arrays that match this parameter value (the World Wide Port Name of a storage array port).

**[ -initiator <text> ] - Initiator**

Selects the arrays that match this parameter value (the host bus adapter that the clustered node uses to connect to storage arrays).

**[ -array-name <array name> ] - Array Name**

Selects the arrays that match this parameter value.

**[ -target-side-switch-port <text> ] - Target Side Switch Port**

Selects the arrays that match this parameter value.

**[ -initiator-side-switch-port <text> ] - Initiator Side Switch Port**

Selects the arrays that match this parameter value.

**[ -lun-count <integer> ] - Number of array LUNs**

Selects the arrays that match this parameter value.

**[ -ownership {all|assigned|unassigned} ] - Ownership**

Selects the arrays that match this parameter value.

## Examples

```
cluster1::> storage array config show
```

## storage array disk paths show

Display a list of LUNs on the given array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array disk paths show` command displays information about disks and array LUNs.

Where it appears in the remainder of this document, "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks:

- Disk Unique Identifier
- Controller name
- Initiator Port
- LUN ID
- Failover optimization type
- The Use State of the LUN on this path
- Target Port
- Target IQN
- TPGN
- Port speeds
- Kbytes/sec on Disk (Rolling Average)
- Number IOPS per second on disk (Rolling Average)

To display detailed information about a single disk, use the **-disk** parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all disks, in column style output.

**[-switch ]**

Displays the switch port information for all disks, in column style output.

**[-instance ]}**

Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the **-disk** parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the **-disk** parameter.

**[-uid <text>] - Disk Unique Identifier**

Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:

```
`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000`
```

**[-disk <disk path name>] - Disk Name**

Displays detailed information about the specified disks.

**[-array-name <array name>] - Array Name**

Selects information about the LUNs presented by the specified storage array.

**[-diskpathnames <disk path name>,...] - Path-Based Disk Names**

Selects information about disks that have all of the specified path names.

**[-nodelist {<nodename>|local}] - Controller name**

Selects information about disks that are visible to all of the specified nodes .

**[-initiator <text>,...] - Initiator Port**

Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

**[-lun <integer>,...] - LUN ID**

Selects information about the specified LUNs.

**[-target-wwpn <text>,...] - Target Port**

Selects information about disks that are visible on target ports identified by their World Wide Port Name.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Selects information about disks visible to an initiator that is connected to the specified switch port.

**[-lun-path-use-state <text>,...] - The Use State of the LUN on this path**

Selects information about LUNs reporting the specified in-use state.

**[-tpgn <integer>,...] - Target Port Group Number**

Selects information about disks that belong to the specified Target Port Group Number.

**[-port-speed <text>,...] - Port Speed**

Selects information about disks served by a Host Bus Adapter that is running at the specified port speed.

**[-lun-io-kbps <integer>,...] - Kbytes/sec on Disk (Rolling Average)**

Selects information about the LUNs that have reached the specified I/O throughput.

**[-lun-iops <integer>,...] - Number IOPS per second on disk (Rolling Average)**

Selects information about the LUNs that have reached the specified number of IOPs.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

**[-target-port-access-state <text>,...] - Failover optimization type**

Selects information about disks visible on target ports that have the specified access state.

**[-initiator-io-kbps <integer>,...] - Kbytes of I/O per second on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

**[-initiator-iops <integer>,...] - Number of IOPS on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed the specified number of IOPs.

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects information about disks visible on target ports that have reached the specified I/O throughput.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects information about disks visible on target ports that have performed the specified number of IOPs.

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects information about disks with paths that have incurred the specified number of FC link errors.

**[-path-io-kbps <integer>,...] - Kbytes of I/O per second on Path (Rolling Average)**

Selects information about disk with paths that have reached the specified I/O throughput.

**[-path-iops <integer>,...] - Number of IOPS on Path (Rolling Average)**

Selects information about disks on those paths that have reached the specified number of IOPs.

**[-path-quality <integer>,...] - Percentage of weighted error threshold**

Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

**[-path-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this path**

Selects information about disks with paths that have the specified in-use-count.

**[-initiator-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this initiator**

Selects information about disks with a path through an initiator that has the specified in-use-count.

**[-target-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this target**

Selects information about disks with a path through a target port that has the specified in-use-count.

**[-preferred-target-port {true|false}] - Whether or not target port group is preferred**

Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Assymmetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

**[-vmdisk-device-id <integer>,...] - Virtual disk device ID**

Selects information about disks that have the specified virtual disk device ID.

**[-host-adapter <text>] - Primary Path Host Adapter**

Selects information about disks that are currently using the specified Host Bus Adapter.

**[-primary-port <text>] - Primary Path Disk Port**

Selects information about disks that use the specified primary port.

**[-secondary-name <disk path name>] - Secondary Path Name**

Selects information about disks that use the specified secondary path name, for multipath configuration.

**[-secondary-port <text>] - Secondary Path Disk Port**

Selects information about disks that use the specified secondary port.

## Examples

The following example displays information about all disks:

```

## storage array port modify

Make changes to a target port record.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array port modify` command lets the user change array target port parameters.

### Parameters

**-name <text> - Name**

Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

**-wwnn <text> - WWNN**

Selects the array ports that match this parameter value.

**-wwpn <text> - WWPN**

Selects the array ports that match this parameter value.

**[-max-queue-depth <integer>] - Target Port Queue Depth**

The target port queue depth for this target port.

**[-utilization-policy {normal|defer}] - Utilization Policy**

The policy used in automatically adjusting the queue depth of the target port based on its utilization.

## Examples

This command changes the maximum queue depth for this target port to 32.

```
cluster1::> storage array port modify -name HITACHI_DF600F_1 -wwnn 50060e80004291c0  
-wwpn 50060e80004291c0 -max-queue-depth 32
```

## storage array port remove

Remove a port record from an array profile.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage array port remove** command removes a port from the array database. You might want to remove ports that are no longer connected to the clustered node. Port information can change after hardware replacement, rezoning, or similar configuration activities. The database retains the records about previous ports unless you remove the information.

## Parameters

**-name <text> - Name**

Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

**{ [-wwnn <text>] - WWNN**

Selects the array ports that match this parameter value.

**[-wwpn <text>] - WWPN**

Selects the array ports that match this parameter value.

**| [-target-iqn <text>] - Target IQN**

Selects the array ports that match this parameter value.

**[-tpgt <integer>] - TPGT }**

Selects the array ports that match this parameter value.

## Examples

This command removes a port record from the array profiles database.

```
cluster1::> storage array port remove -name HITACHI_DF600F_1 -wwnn 50060e80004291c0  
-wwpn 50060e80004291c0
```

## storage array port show

Display information about a storage array's target ports.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage array port show** command displays all the target ports known to the cluster for a given storage array (if an array name is specified) or for all storage arrays if no storage array name is specified. Target ports remain in the database as part of an array profile unless you explicitly remove them from the database.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**| [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-name <text>] - Name**

Selects the array ports that match this parameter value. The storage array name is either

---

generated by Data ONTAP or assigned by the user.

**[-wwnn <text>] - WWNN**

Selects the array ports that match this parameter value.

**[-wwpn <text>] - WWPN**

Selects the array ports that match this parameter value.

**[-max-queue-depth <integer>] - Target Port Queue Depth**

Selects the array ports that match this parameter value.

**[-node {<nodename>|local}] - Controller Name**

Selects the array ports that match this parameter value.

**[-initiator-port <text>,...] - Initiator Port**

Selects the array ports that match this parameter value.

**[-average-dynamic-queue-depth <integer>,...] - Average Dynamic Queue Depth**

The average value of the dynamic target port queue depth.

**[-average-latency-per-iop <integer>,...] - Average Latency Per IOP**

Selects the array ports that match this parameter value (average latency per I/O performed in microseconds).

**[-average-pending <integer>,...] - Average Pending**

Selects the array ports that match this parameter value (average over time of how many commands are on the outstanding queue).

**[-average-waiting <integer>,...] - Average Waiting**

Selects the array ports that match this parameter value (average over time of how many commands are on the waiting queue).

**[-connection-type {direct|fabric|ISCSI}] - Connection Type**

Selects the array ports that match this parameter value (type of connection between the controller and the back end storage).

**[-dynamic-queue-depth <integer>,...] - Dynamic Queue Depth**

Current dynamic target port queue depth, the maximum number of commands allowed outstanding.

**[-max-pending <integer>,...] - Max Pending**

Selects the array ports that match this parameter value (largest number of commands observed on the outstanding queue).

**[-max-waiting <integer>,...] - Max Waiting**

Selects the array ports that match this parameter value (largest number of commands observed on the waiting queue).

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects the array ports that match this parameter value.

**[-percent-busy <integer>,...] - Percent Busy**

Selects the array ports that match this parameter value (percentage of time I/Os are outstanding on the port).

**[-percent-waiting <integer>,...] - Percent Waiting**

Selects the array ports that match this parameter value (percentage of time there are I/Os waiting on the throttle list on the target port).

**[-switch-port <text>] - Switch Port**

Selects the array ports that match this parameter value (for fabric attached connections, the switch port the array target port is connected to; N/A for direct attached).

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects the array ports that match this parameter value.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects the array ports that match this parameter value.

**[-target-lun-in-use-count <integer>,...] - Target LUN In Use Count**

Selects the array ports that match this parameter value (number of IN-USE disks on this target port).

**[-target-port-speed <text>] - Target Port Speed**

Selects the array ports that match this parameter value (speed that the target port has negotiated with its connected switch port, or initiator port if direct attached).

**[-utilization-policy {normal|defer}] - Utilization Policy**

The policy used when sending I/O to an array target port when it reaches maximum queue depth. Possible values are:

- normal - This policy aggressively competes for target port resources, in effect competing with other hosts. (default)
- defer - This policy does not aggressively compete for target port resources, in effect deferring to other hosts.

## Examples

The example below displays the port information for a single port.

```
cluster1::> storage array port show -wwpn 50060e80004291c0
Array Name: HITACHI_DF600F_1
WWNN: 50060e80004291c0
WWPN: 50060e80004291c0
Connection Type: fabric
```

```
Switch Port: vgbr300s89:9
```

```
Link Speed: 4 GB/s
```

```
Max Queue Depth: 1024
```

```
Utilization Policy: normal
```

Node	Initiator	LUN Count	IOPS	KB/s	%busy	%waiting	Link Errs
vnv3070f20a	0b	2	0	0	0	0	0
vnv3070f20b	0b	2	0	0	0	0	0

## storage automated-working-set-analyzer show

Display running instances

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `automated-working-set-analyzer show` command displays the Automated Working-set Analyzer running instances.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance ]`]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node <nodename>`] - Node Name**

This parameter indicates the node name that the AWA instance runs on.

**[`-flash-cache {true|false}`] - Flash Cache Node-wide Modeling**

This parameter indicates whether the AWA is modeling flash-cache.

**[`-aggregate-uuid <UUID>`] - Uuid of the Aggregate**

This parameter indicates the aggregate uuid that the AWA instance runs on.

**[`-aggregate <aggregate name>`] - Aggregate**

This parameter indicates the aggregate name that the AWA instance runs on.

**[`-working-set-size {true|false}`] - Working Set Size**

This parameter indicates whether the AWA instance is configured to find the working set size.

**[-start-time <Date>] - Starting Time**

This parameter indicates the time when the AWA instance was started.

**[-total-intervals <integer>] - Total Interval Count**

This parameter indicates the total number of intervals that the AWA instance has covered.

**[-read-throughput {<integer>[Bps|KBps|MBps|GBps]}] - Read Throughput**

This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks.

**[-write-throughput {<integer>[Bps|KBps|MBps|GBps]}] - Write Throughput**

This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks

**[-cacheable-read <percent>] - Cacheable Read**

This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

**[-cacheable-write <percent>] - Cacheable Write**

This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

**[-projected-cache-size {<integer>[KB|MB|GB|TB|PB]}] - Max Projected Cache Size**

This parameter indicates the projected Flash Pool cache usage.

**[-projected-read-hit <percent>] - Projected Read Hit**

This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of HDDs.

**[-projected-write-hit <percent>] - Projected Write Hit**

This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs.

**[-referenced-interval-id <integer>] - Referenced Interval ID**

This parameter indicates the interval in which the cache size effect information is derived from.

**[-referenced-interval-time <Date>] - Referenced Interval Time**

This parameter indicates the time when the referenced interval for the cache size effect information is derived from.

**[-referenced-interval-cache-size {<integer>[KB|MB|GB|TB|PB]}] - Referenced Interval Cache Size**

This parameter indicates the cache size at the end of the referenced interval from which the cache size effect information is based on.

**[-read-hit-20 <percent>] - 20% Cache Read Hit**

This parameter indicates the predicted read hit rate when the cache size is 20% of the referenced cache size.

**[-read-hit-40 <percent>] - 40% Cache Read Hit**

This parameter indicates the predicted read hit rate when the cache size is 40% of the referenced cache size.

**[-read-hit-60 <percent>] - 60% Cache Read Hit**

This parameter indicates the predicted read hit rate when the cache size is 60% of the referenced cache size.

**[-read-hit-80 <percent>] - 80% Cache Read Hit**

This parameter indicates the predicted read hit rate when the cache size is 80% of the referenced cache size.

**[-read-hit-100 <percent>] - 100% Cache Read Hit**

This parameter indicates the predicted read hit rate when the cache size is 100% of the referenced cache size.

**[-write-hit-20 <percent>] - 20% Cache Write Hit**

This parameter indicates the predicted write hit rate when the cache size is 20% of the referenced cache size.

**[-write-hit-40 <percent>] - 40% Cache Write Hit**

This parameter indicates the predicted writehit rate when the cache size is 40% of the referenced cache size.

**[-write-hit-60 <percent>] - 60% Cache Write Hit**

This parameter indicates the predicted write hit rate when the cache size is 60% of the referenced cache size.

**[-write-hit-80 <percent>] - 80% Cache Write Hit**

This parameter indicates the predicted write hit rate when the cache size is 80% of the referenced cache size.

**[-write-hit-100 <percent>] - 100% Cache Write Hit**

This parameter indicates the predicted write hit rate when the cache size is 100% of the referenced cache size.

**[-num-intervals-show <integer>] - Number of intervals to show**

This parameter indicates the number of intervals to the past this command is showing.

## Examples

The following example shows a running instance of automated-working-set-analyzer on node **node1** for aggregate **aggr0**.

```
cluster1::> cluster-1::*> storage automated-working-set-analyzer show
Node          FC    Aggregate  wss    Intervals Start Time
-----
node1         false aggr0      false  125 Wed Jul 22 13:58:17 2015
```

## storage automated-working-set-analyzer start

Command to start Automated Working Set Analyzer on node or aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage automated-working-set-analyzer start` command enables the Automated Workload Analyzer that is capable of doing the following:

- Flash Pool modeling for an aggregate
- Flash Cache modeling for a node - can not specify an aggregate.
- Working set size estimation
- Workload monitoring

### Parameters

**-node <nodename> - Node Name**

This parameter indicates the node name that the AWA instance runs on.

**[-flash-cache {true|false}] - Flash Cache Node-wide Modeling**

This parameter indicates whether the AWA is modeling flash-cache.

**[-aggregate <aggregate name>] - Aggregate**

This parameter indicates the aggregate name that the AWA instance runs on.

**[-working-set-size {true|false}] - Working Set Size**

This parameter indicates whether the AWA instance is configured to find the working set size.

### Examples

```
cluster1::> storage automated-working-set-analyzer start -node vsim1 -aggregate aggr0
```

# storage automated-working-set-analyzer stop

Command to stop Automated Working Set Analyzer on node or aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The storage automated-working-set-analyzer stop command terminates one or multiple Automated Workload Analyzer running instances.

## Parameters

**-node <nodename> - Node Name**

This parameter indicates the node name that the AWA instance runs on.

**[-flash-cache {true|false}] - Flash cache node-wide modeling**

This parameter indicates whether the AWA is modeling flash-cache.

**[-aggregate <aggregate name>] - Aggregate**

This parameter indicates the aggregate name that the AWA instance runs on.

## Examples

```
cluster1::> storage automated-working-set-analyzer stop -node vsim1 -aggregate aggr1
```

# storage automated-working-set-analyzer volume show

Displays the Automated Working Set Analyzer volume table

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The automated-working-set-analyzer volume show command displays the volume statistics reported by the corresponding Automated Working-set Analyzer running instances.

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the

specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[`-instance`] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-node <nodename>`] - Node**

This parameter indicates the node name that the AWA instance runs on.

### **[`-flash-cache {true|false}`] - Flash Cache Node-wide Modeling**

This parameter indicates whether the AWA is modeling flash-cache.

### **[`-vol-uuid <UUID>`] - Uuid of the Volume**

This parameter indicates the volume uuid that this command is issued on.

### **[`-aggregate <aggregate name>`] - Aggregate**

This parameter indicates the aggregate name that the AWA instance runs on.

### **[`-volume <volume name>`] - Volume**

This parameter indicates the volume name that this command is issued on.

### **[`-rank <integer>`] - Cache Benefit Rank**

This parameter indicates the rank of this volume among all volumes that would be most benefited by the modeled cache technology based on the AWA prediction.

### **[`-read-throughput {<integer>[Bps|KBps|MBps|GBps]}`] - Read Throughput**

This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks for this volume.

### **[`-write-throughput {<integer>[Bps|KBps|MBps|GBps]}`] - Write Throughput**

This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks for this volume.

### **[`-cacheable-read <percent>`] - Cacheable Read**

This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed for this volume. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

### **[`-cacheable-write <percent>`] - Cacheable Write**

This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

### **[`-projected-cache-size {<integer>[KB|MB|GB|TB|PB]}`] - Max Projected Cache Size**

This parameter indicates the projected Flash Pool cache usage by this volume.

### **[`-projected-read-hit <percent>`] - Projected Read Hit**

This parameter indicates the percentage of blocks that could be read from the Flash Pool cache

instead of HDDs for this volume.

### **[-projected-write-hit <percent>] - Projected Write Hit**

This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs for this volume.

### **[-num-intervals-show <integer>] - Number of intervals to show**

This parameter indicates the number of intervals to the past this command is showing.

## Examples

```
cluster1::> cluster-1::*> storage automated-working-set-analyzer volume show
Node          FC    Aggregate  Volume    Rank  Read Thrupt  Write Thrupt
-----
vsim1         false aggr0      vol0       1    230.47KBps   580.09KBps
```

# storage disk assign

Assign ownership of a disk to a system

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk assign** command is used to assign ownership of an unowned disk or array LUN to a specific node. You can also use this command to change the ownership of a disk or an array LUN to another node. You can designate disk ownership by specifying disk names, array LUN names, wildcards, or all (for all disks or array LUNs visible to the node). For disks, you can also set up disk ownership autoassignment. You can also assign disks to a particular pool. You can also assign disks by copying ownership from another disk.

## Parameters

### **{ [-disk <disk path name>] - Disk Path**

This specifies the disk or array LUN that is to be assigned. Disk names take one of the following forms:

- Disks are named in the form **<stack-id> .<shelf> .<bay>**
- Disks on multi-disk carriers are named in the form **<stack-id> .<shelf> .<bay> .<lun>**
- Virtual disks are named in the form **<prefix>.<number>**, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form **<node> :<host\_adapter> .<loop\_ID>** . For disks with a LUN, the form is **<node> :<host\_adapter> .<loop\_ID> L<LUN>** . For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form **<node> :<switch\_name> :<switch\_port> .<loop\_ID>** . For disks with a LUN, the form is **<node> :<switch\_name> :<switch\_port> .<loop\_ID> L<LUN>** . For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

A subset of disks or array LUNs can be assigned using the wildcard character (\*) in the **-disk** parameter. Either the **-owner** , the **-sysid** , or the **-copy-ownership-from** parameter must be specified with the **-disk** parameter. Do not use the **-node** parameter with the **-disk** parameter.

#### | **-disklist <disk path name>,...** - Disk list

This specifies the List of disks to be assigned.

#### | **-all <true>** - Assign All Disks

This optional parameter causes assignment of all visible unowned disks or array LUNs to the node specified in the **-node** parameter. The **-node** parameter must be specified with the **-all** parameter. When the **-copy-ownership-from** parameter is specified with the **-node** parameter, it assigns disk ownership based on the **-copy-ownership-from** parameter; otherwise it assigns ownership of the disks based on the **-node** parameter. Do not use the **-owner** or the **-sysid** parameter with the **-all** parameter.

#### | [**-T, -type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}**] - Storage Type

This optional parameter assigns ownership of a specific type of disk or array LUN (or a set of disks/array LUNs) to a node. The **-count** parameter must be specified with the **-type** parameter.

#### **-n, -count <integer>** - Disk Count

This optional parameter assigns ownership of a number of disks or array LUNs specified in the **-count** parameter, to a node.

#### | **-auto <true>** - Auto Assign }

This optional parameter causes all visible disks eligible for autoassignment to be immediately assigned to the node specified in the **-node** parameter, regardless of the setting of the disk.auto\_assign option. Only unowned disks on loops or stacks owned wholly by that system and which have the same pool information will be assigned. The **-node** parameter must be specified with the **-auto** parameter. Do not use the **-owner** , the **-sysid** , or the **-copy-ownership-from** parameter with the **-auto** parameter. When possible, use the **-auto** parameter rather than the **-all** parameter to conform to disk ownership best practices. The **-auto** parameter is ignored for array LUNs.

**[-p, -pool <integer>] - Pool**

This optional parameter specifies the pool to which a disk must be assigned. It can take values of "0" or "1".

**{ [-o, -owner <nodename>] - Owner Name**

This optional parameter specifies the node to which the disk or array LUN has to be assigned.

**[-s, -sysid <nvramid>] - New Owner ID**

This optional parameter specifies the serial number (NVRAM ID) of the node to which the disk or array LUN has to be assigned.

**[-copy-ownership-from <disk path name>] - Disk Name to Copy Ownership }**

This optional parameter specifies the disk name from where the node needs to copy disk ownership information. You can use this parameter for disks to have the same ownership as the provided input disk.

**[-c, -checksum {block|zoned|advanced\_zoned}] - Checksum Compatibility**

This optional parameter is used to set the checksum type for a disk or an array LUN. The possible values are **block** , **zoned** , and **advanced\_zoned** . This operation will fail if the specified disk is incompatible with the specified checksum type. A newly created aggregate with zoned checksum array LUNs is assigned advanced zoned checksum (AZCS) checksum type. AZCS checksum type provides more functionality than the "version 1" zoned checksum type which has been supported in previous Data ONTAP releases. Zoned checksum spare array LUNs added to an existing zoned checksum aggregate continue to be zoned checksum. Zoned checksum spare array LUNs added to an AZCS checksum type aggregate use the AZCS checksum scheme for managing checksums. For some disks (e.g. FCAL, SSD, SAS disks), the checksum type cannot be modified. For more information on modifying the checksum type, refer to the "Physical Storage Management Guide".

**[-f, -force <>true>] - Force Flag**

This optional parameter forces the assignment of ownership of an already owned disk to a node. This parameter could also be used to assign an array LUN with a redundancy error, for example, if the array LUN is available on only one path. For a disk which is part of a live aggregate, even specification of the **-force** parameter would not force the assignment, since it would be catastrophic.

**[-N, -node <nodename>] - Node Name (For Auto Assign)**

This optional parameter is used with either the **-auto** or the **-all** parameter. If used with the **-auto** parameter, all disks which are visible to the node specified in the **-node** parameter and which are eligible for autoassignment would be assigned to it. If used with the **-all** parameter, all unowned disks or array LUNs visible to the node would be assigned to it.

**{ [-root <>true>] - Root Partition of Root-Data or Root-Data1-Data2 Partitioned Disk**

This optional parameter assigns the root partition of a root-data/root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is **false** .

**[`-data <true>`] - Data Partition of Root-Data Partitioned Disk**

This optional parameter assigns the data partition of a root-data partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is **false**.

**[`-data1 <true>`] - Data1 Partition of Root-Data1-Data2 Partitioned Disk**

This optional parameter assigns the data1 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is **false**.

**[`-data2 <true>`] - Data2 Partition of Root-Data1-Data2 Partitioned Disk }**

This optional parameter assigns the data2 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is **false**.

## Examples

The following example assigns ownership of an unowned disk named ```_1_``.``_1_``.``_16_``` to a node named ```_node1_```:

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
```

The following example assigns all unowned disks or array LUNs visible to a node named **node1** to itself:

```
cluster1::> storage disk assign -all -node node1
```

The following example autoassigns all unowned disks (eligible for autoassignment) visible to a node named **node1** to itself:

```
cluster1::> storage disk assign -auto -node node1
```

The following two examples show the working of the **-force** parameter with a spare disk that is already owned by another system:

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
Error: command failed: Failed to assign disks. Reason: Disk 1.1.16 is
already owned.
```

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -force
Success.
```

The following example assigns ownership of the set of unowned disks on **<stack>1**, to a node named **node1**:

```
cluster1::> storage disk assign -disk 1.* -owner node1
```

The following example assigns ownership of unowned disk **1.1.16** by copying ownership from disk **1.1.18**:

```
cluster1::> storage disk assign -disk 1.1.16  
-copy-ownership-from 1.1.18
```

The following example assigns all unowned disks visible to a node named ``\_node1\_`` by copying ownership from disk ``\_1\_`` ``\_1\_`` ``\_18\_`` :

```
cluster1::> storage disk assign -all -node node1  
-copy-ownership-from 1.1.18
```

The following example assigns the root partition of disk **1.1.16** to node1.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -root true  
-force true
```

The following example assigns the data partition of root-data partitioned disk **1.1.16** to node1.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -data true  
-force true
```

The following example assigns the data1 partition of root-data1-data2 partitioned disk **1.1.24** to node1.

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data1 true  
-force true
```

The following example assigns the data2 partition of root-data1-data2 partitioned disk **1.1.24** to node1.z33

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data2 true  
-force true
```

## storage disk fail

Fail the file system disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk fail** command can be used to manually force a file system disk to fail. It is used to remove a file system disk that may be logging excessive errors and requires replacement. To unfail a disk, use the [storage disk unfail](#) command.

## Parameters

**-disk <disk path name> - Disk Name**

This parameter specifies the disk to be failed.

**[-i, -immediate <true>] - Fail immediately**

This parameter optionally specifies whether the disk is to be failed immediately. It is used to avoid Rapid RAID Recovery and remove the disk from the RAID configuration immediately. Note that when a file system disk has been removed in this manner, the RAID group to which the disk belongs enters degraded mode (meaning a disk is missing from the RAID group). If a suitable spare disk is available, the contents of the disk being removed are reconstructed onto that spare disk.

## Examples

The following example fails a disk named 1.1.16 immediately:

```
cluster1::> storage disk fail -disk 1.1.16 -i true
WARNING: The system will not prefail the disk and its contents will not be
copied to a replacement disk before being failed out. Do you want to
fail out the disk immediately? {y|n}: y
```

# storage disk reassign

(DEPRECATED)-Change the default owner of all disks from one node to another

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage disk reassign** is deprecated and may be removed in a future release of Data ONTAP. Disk reassignment is no longer required as part of a controller replacement procedure. For further

information, see the latest controller or NVRAM FRU replacement flyer for your system. This command changes the ownership of all disks on a node to the ownership of another node. Use this command only when a node has a complete failure (for instance, a motherboard failure) and is replaced by another node. If the node's disks have already been taken over by its storage failover partner, use the **-force** parameter.

## Parameters

**-s, -homeid <nvrמיד> - Current Home ID**

This specifies the serial number of the failed node.

**-d, -newhomeid <nvrמיד> - New Home ID**

This specifies the serial number of the node that is to take ownership of the failed node's disks.

**[-f, -force <true>] - Force**

This optionally specifies whether to force the reassignment operation. The default setting is **false**.

## Examples

In the following example, a node named node0 and having serial number 12345678 has failed. Its disks have not been taken over by its storage failover partner. A replacement node with serial number 23456789 was installed and connected to node0's disk shelves. To assign node0's disks to the new node, start the new node and run the following command:

```
cluster::*> storage disk reassign -homeid 12345678 -newhomeid 23456789
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.16, 1.1.23 and 1.1.24
were reassigned to new owner with serial number 23456789.
```

In the following example, a similar failure has occurred, except that node0's disks have been taken over by its storage failover partner, node1. A new node with serial number 23456789 has been installed and configured. To assign the disks that previously belonged to node0 to this new node, run the following command:

```
cluster::*> storage disk reassign -homeid 12345678 -newhomeid 23456789 -force true
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.16, 1.1.23 and 1.1.24
were reassigned to new owner with serial number 23456789.
```

## storage disk refresh-ownership

Refresh the disk ownership information on a node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command updates the disk ownership information for all the disks attached to a node to the latest view for all the nodes in the cluster. During normal operations, disk ownership is kept up to date automatically. In certain circumstances, however, disk ownership must be updated manually. If this is required, EMS messages will indicate that this command should be run. If the `-node` parameter is provided, the disk ownership information is updated only on the node specified.

## Parameters

`[-node {<nodename>|local}] - Node`

If this parameter is provided, the disk ownership information is updated only on the node specified.

## Examples

The following example refreshes the disk ownership information for all the nodes in the cluster:

```
cluster1::> storage disk refresh-ownership
```

# storage disk remove-reservation

Removes reservation from an array LUN marked as foreign.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage disk remove-reservation` command removes persistent reservation from a specified foreign array LUN.

## Parameters

`-disk <disk path name> - Disk Name`

This specifies the disk from which persistent reservation is to be removed.

## Examples

The following example removes the persistent reservation from a disk named `node1:switch01:port.126L1`.

```
cluster1::> storage disk remove-reservation -disk node1:switch01:port.126L1
```

# storage disk remove

Remove a spare disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk remove** command removes the specified spare disk from the RAID configuration, spinning the disk down when removal is complete.

This command does not remove disk ownership information from the disk. Therefore, if you plan to reuse the disk in a different storage system, you should use the [storage disk removeowner](#) command instead. See the "Physical Storage Management Guide" for the complete procedure.

For systems with multi-disk carriers, it is important to ensure that none of the disks in the carrier are filesystem disks before attempting removal. To convert a filesystem disk to a spare disk, see [storage disk replace](#).

## Parameters

**-disk <disk path name> - Disk Name**

This parameter specifies the disk to be removed.

## Examples

The following example removes a spare disk named 1.1.16:

```
cluster1::> storage disk remove -disk 1.1.16
```

## Related Links

- [storage disk removeowner](#)
- [storage disk replace](#)

# storage disk removeowner

Remove disk ownership

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk removeowner** command removes ownership from a specified disk. Then disk can then be reassigned to a new owner.

## Parameters

**-disk <disk path name> - Disk Name**

This specifies the disk whose ownership is to be removed.

## Examples

The following example removes the ownership from a disk named 1.1.27.

```
cluster1::> storage disk removeowner -disk 1.1.27
```

# storage disk replace

Initiate or stop replacing a file-system disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk replace** command starts or stops the replacement of a file system disk with spare disk. When you start a replacement, Rapid RAID Recovery begins copying data from the specified file system disk to a spare disk. When the process is complete, the spare disk becomes the active file system disk and the file system disk becomes a spare disk. If you stop a replacement, the data copy is halted, and the file system disk and spare disk retain their initial roles.

## Parameters

**-disk <disk path name> - Disk Name**

This specifies the file system disk that is to be replaced. Disk names take one of the following forms:

- Disks are named in the form **<stack-id> .<shelf> .<bay>**
- Disks on multi-disk carriers are named in the form **<stack-id> .<shelf> .<bay> .<lun>**
- Virtual disks are named in the form **<prefix>.<number>**, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node> :<host_adapter> .<loop_ID>` . For disks with a LUN, the form is `<node> :<host_adapter> .<loop_ID> L<LUN>` . For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form `<node> :<switch_name> :<switch_port> .<loop_ID>` . For disks with a LUN, the form is `<node> :<switch_name> :<switch_port> .<loop_ID> L<LUN>` . For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

#### **-action {start | stop} - Action**

This specifies whether to start or stop the replacement process.

#### **[-replacement <disk path name>] - Replacement**

This specifies the spare disk that is to replace the file system disk.

#### **[-allow-same-carrier <true>] - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you replace a disk in an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can replace a disk in an aggregate with a disk that causes this situation, but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, ensure that disks housed in the same carrier are in different RAID groups.

This parameter affects only the disk replace operation. It is not a persistent attribute of the aggregate.

#### **[-m, -allow-mixing <true>] - Allow Mixing of Disks of Different RPM or Pool**

This optional parameter specifies whether the disk can be replaced with another disk of different RPM or from different Pool. This parameter affects only the current disk replacement operation.

## Examples

The following example begins replacing a file system disk named **1.0.16** with a spare disk named **1.1.14** .

```
cluster1::> storage disk replace -disk 1.0.16 -replacement 1.1.14 -action start
```

# storage disk set-foreign-lun

Sets or Unsets an array LUN as foreign

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk set-foreign-lun** command sets or unsets a specified array LUN as foreign. This command will enable/disable the feature of importing the data from foreign LUN.

## Parameters

**-disk <disk path name> - Disk Name**

This parameter specifies the array LUN which is to be set or unset as foreign.

**-is-foreign-lun <true> - Is Foreign LUN**

If the parameter value specified is **true** then array LUN is set as foreign. If the parameter value specified is **false** then array LUN foreignness is cleared.

## Examples

The following example shows how to set an array LUN as foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun true
```

The following example shows how to mark an array LUN as not foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun false
```

# storage disk set-led

Identify disks by turning on their LEDs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk set-led** command controls the LED of a specified disk.

You can turn an LED on or off, cause it to blink or stop blinking, or test it.

This command is useful for locating a disk in its shelf.

## Parameters

### **-action {on|off|blink|blinkoff|testall|resetall} - Action**

This parameter specifies the state to which the LED is to be set. Possible values include the following:

- on - The LED is lit steadily
- off - The LED is not lit
- blink - The LED blinks
- blinkoff - The LED stops blinking and is not lit
- testall - This tests the operation of every disk enclosure's hardware and drivers per node. Do not use this value in normal operation.
- resetall - This resets the LED of every disk on the node and lights up the LED of disks with faults.

### **{ [-disk <disk path name>] - Disk Name**

This specifies the disk whose LED is to be set. Disk names take one of the following forms:

- Disks are named in the form **<stack-id> .<shelf> .<bay>**
- Disks on multi-disk carriers are named in the form **<stack-id> .<shelf> .<bay> .<lun>**
- Virtual disks are named in the form **<prefix>.<number>**, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form **<node> :<host\_adapter> .<loop\_ID>** . For disks with a LUN, the form is **<node> :<host\_adapter> .<loop\_ID> L<LUN>** . For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form **<node> :<switch\_name> :<switch\_port> .<loop\_ID>** . For disks with a LUN, the form is **<node> :<switch\_name> :<switch\_port> .<loop\_ID> L<LUN>** . For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

### **| [-adapter <text>] - Adapter Name**

The name of the adapter to which the shelves of disks of interest are attached to.

### **[-node {<nodename>|local}] - Node Name }**

The node for which action is to be taken.

**[-duration <integer>] - Duration (minutes)**

This specifies the duration, in minutes, that the LED is to remain in the specified state. Only actions "on" and "blink" are supported.

**[-iteration <integer>] - Test iterations**

This specifies the number of iterations to run the action for. Only action "test-all" is supported.

## Examples

The following example causes the LEDs on all disks whose names match the pattern 1.0.\* to turn on for 5 minutes:

```
Cluster1::> storage disk set-led -disk 1.0.* -action on -duration 5
```

The following example causes the LEDs on disks 1.0.0 and 1.0.1 to turn on for 2 minutes:

```
Cluster1::> storage disk set-led -disk 1.0.0,1.0.1 -action on -duration 2
```

The following example causes the LEDs on all disks attached to adapter 0b on Node2 to turn on for 1 minute:

```
Cluster1::> storage disk set-led -node Node2 -adapter 0b -action on -duration 1
```

The following example resets the LEDs on all disks on the local node and causes the LEDs of disks with faults to turn on:

```
Cluster1::> storage disk set-led -action resetall
```

The following example tests the LEDs on all disks owned by the local node for 3 iterations:

```
Cluster1::> storage disk set-led -action testall -iteration 3
```

## storage disk show

Display a list of disk drives and array LUNs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk show** command displays information about disks and array LUNs. Where it appears

in the remainder of this document "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks in column style output:

- Disk name
- Usable space on the disk, in human readable units
- Shelf number
- Bay number
- Container type (aggregate, broken, foreign, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, volume, or unsupported)
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- Container name
- Owning node name

To display detailed information about a single disk, use the **-disk** parameter.

## Parameters

**{ [-fields <fieldname>, ...]**

Displays the specified fields for all disks, in column style output.

**[ [-broken ]**

Displays the following RAID-related information about broken disks:

- Original owning node name
- Checksum compatibility
- Disk name
- Outage reason
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

**[ [-errors ]**

Displays the following disk information about the disks which have errors.

- Disk Name
- Error Type
- Error Description and corresponding corrective action

### | [-longop ]

Displays the following information about long-running disk operations, in column style output:

- Disk name
- Whether the disk is marked as prefailed
- Whether the disk is being replaced
- Whether the disk is zeroed
- Copy destination
- Percentage of copy complete
- Percentage of zeroing complete
- Percentage of reconstruction complete

### | [-maintenance ]

Displays the following RAID-related information about disks in the maintenance center:

- Original owning node name
- Checksum compatibility
- Disk name
- Outage Reason
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

### | [-ownership ]

Displays the following ownership-related information:

- Disk name
- Aggregate name
- Home node name

- Owning node name
- Disaster recovery home node name
- Home node system id
- Owning node system id
- Disaster recovery home node system id
- Reservation node system id
- SyncMirror pool

### **| [-partition-ownership ]**

Displays the following ownership-related information for partitioned disks:

- Disk name
- Aggregate name
- Owner of root partition on a partitioned disk
- Owner system id of root partition on a partitioned disk
- Owner of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
- Owner system id of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
- Owner of data2 partition on a root-data1-data2 partitioned disk
- Owner system id of data2 partition on a root-data1-data2 partitioned disk
- Owner of the disk which is partitioned
- Owner system id of the disk which is partitioned

### **| [-physical ]**

Displays the following information about the disk's physical attributes, in column style output:

- Disk name
- Disk type
- Disk vendor
- Disk model
- Firmware revision level
- RPM (Revolutions per minute)
- BPS (Bytes per sector)

### **| [-port ]**

Displays the following path-related information:

- Disk name and disk port associated with disk primary path
- Disk name and disk port associated with the disk secondary path, for a multipath configuration

- Type, shelf, and bay information for the disks

### **[ [-raid ]**

Displays the following RAID-related information:

- Disk name
- Container type (aggregate, broken, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, or volume)
- Outage reason
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- RAID group name
- Aggregate name

### **[ [-raid-info-for-aggregate ]**

Displays the following RAID-related information about the disks used in an aggregate:

- Owning node name
- Aggregate name
- Plex name
- RAID group name
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- Disk name
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units

When this parameter is specified, RAID groups that use shared disks are not included. Use [storage aggregate show-status](#) to show information for all RAID groups and aggregates.

### **[ [-spare ]**

Displays the following RAID-related information about available spare disks:

- Original owning node name
- Checksum compatibility
- Disk name

- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- Disk class
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

### | [-ssd-wear ]

Displays the following wear life related information about solid state disks:

- **Rated Life Used** : An estimate of the percentage of device life that has been used, based on the actual device usage and the manufacturer's prediction of device life. A value greater than 99 indicates that the estimated endurance has been used, but this does not necessarily indicate a device failure. Omitted if value is unknown.
- **Spare Blocks Consumed Limit** : Spare blocks consumed percentage limit reported by the device. When the Spare Blocks Consumed percentage for the device reaches this read-only value, Data ONTAP initiates a disk copy operation to prepare to remove the device from service. Omitted if value is unknown.
- **Spare Blocks Consumed** : Percentage of device spare blocks that have been used. Each device has a number of spare blocks that will be used when a data block can no longer be used to store data. This value reports what percentage of the spares have already been consumed. Omitted if value is unknown.

### | [-virtual-machine-disk-info ]

Displays information about Data ONTAP virtual disks, their mapped datastores and their specific backing device attributes, such as: disk or LUN, adapter and initiator details (if applicable).

- Disk name.
- Name of the node.
- Data ONTAP-supplied serial number of the system disk.
- Size of the system disk.
- Name of the disk backing store. A backing store represents a storage location for virtual machine files. It can be a VMFS volume, a directory on network-attached storage, or a local file system path.
- File name of the virtual disk used by the hypervisor. Each Data ONTAP disk is mapped to a unique VM disk file.
- Type of the disk backing store. It can be a VMFS volume, a directory on network-attached

storage, or a local file system path.

- Size of the disk backing store.
- Full path to the backing store for network-attached storage. This field is valid only for NAS connections.
- Backing adapter PCI device ID for the virtual disk, for example "50:00.0".
- Backing adapter device name, for example "vmhba32".
- Backing adapter model type, for example "LSI1064E".
- Backing adapter driver name of the initiator.
- The iSCSI name of the disk backing target. This field is valid only for iSCSI connections.
- The iSCSI IP address of the disk backing target. This field is valid only for iSCSI connections.
- SCSI device name for the backing disk. It takes the form target-id:lun-id, for example "2:1".
- Hypervisor-assigned unique ID of the backing device (disk or LUN).
- Backing disk partition number where the corresponding VM disk file resides.
- Size of the backing device (disk or LUN).
- Backing device manufacturer, for example "FUJITSU" or "IBM".
- Backing device model, for example "MBE2073RC" or "LUN".
- Storage account associated with the VM Disk.
- Container associated with the VM Disk.
- Page blob associated with the VM Disk.
- Error (if any) while retrieving virtual disk details.

#### **| [-vmdisk-backing-info ]**

Displays information about the backing disks on certain Data ONTAP-v models:

- Disk name
- Backing disk vendor
- Backing disk model
- Backing disk serial number
- Backing disk device id

#### **| [-foreign ]**

Displays the following foreign LUN import related information about foreign disks:

- Disk name
- Array name
- Capacity in sectors
- Capacity in mb
- Serial Number

**| [-physical-location ]**

Displays the following information about disks:

- Disk name
- Container type
- Primary path
- Location
- Home node name
- Physical size in human readable units

**| [-primary-paths ]**

Displays the following information about disks:

- Disk Name
- Shelf
- Bay
- Container Type
- Primary Path

**| [-instance ] }**

Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the `-disk` parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the `-disk` parameter.

**[-disk <disk path name>] - Disk Name**

Displays detailed information about the specified disks. Disk names take one of the following forms:

- Disks are named in the form **<stack-id> .<shelf> .<bay>**
- Disks on multi-disk carriers are named in the form **<stack-id> .<shelf> .<bay> .<lun>**
- Virtual disks are named in the form **<prefix>.<number>**, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form **<node> :<host\_adapter> .<loop\_ID>** . For disks with a LUN, the form is **<node> :<host\_adapter> .<loop\_ID> L<LUN>** . For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form **<node> :<switch\_name> :<switch\_port> .<loop\_ID>** . For disks with a LUN, the form is **<node> :<switch\_name> :<switch\_port> .<loop\_ID> L<LUN>** . For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

**[-owner {<nodename>|local}] - Owner**

Selects information about disks that are owned by the specified node.

**[-owner-id <nvramid>] - Owner System ID**

Selects the disks that are owned by the node with the specified system ID.

**[-is-foreign {true|false}] - Foreign LUN**

Selects information about array LUNs that have been declared to be foreign LUNs.

**[-uid <text>] - Disk Unique ID**

Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:

```
`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000`
```

**[-aggregate <aggregate name>] - Aggregate**

Selects information about disks that belong to the specified aggregate.

**[-array-name <array name>] - Array Name**

Selects information about the LUNs presented by the specified storage array.

**[-average-latency <integer>] - Average I/O Latency Across All Active Paths**

Selects information about disks that have the specified average latency.

**[-bay <integer>] - Bay**

Selects information about disks that are located in the carrier within the specified shelf bay.

**[-bps <integer>] - Bytes Per Sector**

Selects information about disks that have the specified number of bytes per sector. Possible settings are 512, 520, 4096, and 4160.

**[-carrier-id <text>] - Carrier ID**

Selects information about disks that are located within the specified multi-disk carrier.

**[-checksum-compatibility {advanced\_zoned | block | none}] - Checksum Compatibility**

Selects information about disks that have the specified checksum compatibility.

**[-class {capacity | performance | archive | solid-state | array | virtual}] - Disk Class**

Selects information about disks that have the specified disk class.

- capacity = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- performance = Performance-oriented, enterprise class disk types. Includes disk types FCAL

and SAS.

- archive = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- solid-state = Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM.
- array = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- virtual = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

**[-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}] - Container Type**

Selects information about disks that have the specified container type.

- Aggregate = Disk is used as a physical disk in an aggregate.
- Broken = Disk is in broken pool.
- Foreign = Array LUN has been marked foreign.
- Labelmaint = Disk is in online label maintenance list.
- Maintenance = Disk is in maintenance center.
- Mediator = A mediator disk is a disk used on non-shared HA systems hosted by an external node which is used to communicate the viability of the storage failover between non-shared HA nodes.
- Remote = Disk belongs to the remote cluster.
- Shared = Disk is partitioned or in a storage pool.
- Spare = Disk is a spare disk.
- Unassigned = Disk ownership has not been assigned.
- Unknown = Container is currently unknown. This is the default setting.
- Unsupported = Disk is not supported.

**[-container-name <text>] - Container Name**

Selects information about disks that have the specified container name. + If a disk is in an aggregate or storage pool, the container name is the name of the aggregate or storage pool. + Spare disks show the SyncMirror Pool to which they belong. + Partitioned disks could return multiple aggregate names.

**[-copy-destination <disk path name>] - Copy Destination Name**

Selects information about disks whose contents are being copied (due to either Rapid RAID Recovery or disk replacement) to the specified spare disk.

**[-copy-percent <integer>] - Percentage of Copy Complete**

Selects information about disks that are involved as either a source or destination of a copy operation, (due to either disk replacement or Rapid RAID Recovery) and that have the specified percentage of the copy operation completed.

**[-data-owner {<nodename>|local}] - Owner of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition owner name. Used with root-data partitioned disks.

**[-data1-owner {<nodename>|local}] - Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition owner name. Used with root-data1-data2 partitioned disks.

**[-data2-owner {<nodename>|local}] - Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition owner name. Used with root-data1-data2 partitioned disks.

**[-data-home {<nodename>|local}] - Home Owner of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition home owner name. Used with root-data partitioned disks.

**[-data1-home {<nodename>|local}] - Home Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition home owner name. Used with root-data1-data2 partitioned disks.

**[-data2-home {<nodename>|local}] - Home Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition home owner name. Used with root-data1-data2 partitioned disks.

**[-data-owner-id <nvramid>] - Owner System ID of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition owner system ID. Used with root-data partitioned disks.

**[-data1-owner-id <nvramid>] - Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition owner system ID. Used with root-data1-data2 partitioned disks.

**[-data2-owner-id <nvramid>] - Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition owner system ID. Used with root-data1-data2 partitioned disks.

**[-data-home-id <nvramid>] - Home Owner System ID of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition home owner system ID. Used with root-data partitioned disks.

**[-data1-home-id <nvramid>] - Home Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition home owner system ID.

Used with root-data1-data2 partitioned disks.

**[-data2-home-id <nvramid>] - Home Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition home owner system ID. Used with root-data1-data2 partitioned disks.

**[-disk-io-kbps-total <integer>] - Total Disk Throughput in KBPS Across All Active Paths**

Selects information about disks that have attained the specified I/O throughput on all connected paths.

**[-disk-iops-total <integer>] - Total Disk IOPs Across All Active Paths**

Selects information about disks that have achieved the specified number of IOPs per second on all connected paths.

**[-diskpathnames <disk path name>, ...] - List of Path-Based Disk Names**

Selects information about disks that have all of the specified path names.

**[-effective-rpm <integer>] - Effective RPM**

Selects information about disks with the specified effective rotational speed.

**[-dr-home {<nodename>|local}] - Disaster Recovery Home**

Selects information about disks that have the specified Disaster home node.

**[-dr-home-id <nvramid>] - Disaster Recovery Home System ID**

Selects information about disks whose Disaster home node has the specified system id.

**[-drawer <integer>] - Drawer**

Selects information about disks that are located in the specified drawer.

**[-error-type**

**{onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}] - Error Type**

Selects information about disks that have the specified error types.

- onepath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.
- foreign = The array LUN is marked as foreign and has some external SCSI reservations other than those from Data ONTAP.
- toobig = The array LUN exceeds the maximum array LUN size that Data ONTAP supports.
- toosmall = The array LUN is less than the minimum array LUN size that Data ONTAP supports.
- invalidblocksize = The array LUN is not a valid block size.
- targetasymmap = The array LUN is presented more than once on a single target port.
- deviceasymmap = The array LUN is presented with multiple IDs.

- failovermisconfig = The array LUN is configured with inconsistent failover methods.
- unknown = The array LUN from a storage array that is not supported by this version of Data ONTAP.
- netapp = A SAN front-end LUN from one Data ONTAP system that is presented as external storage to another Data ONTAP system.
- fwdownrev = The disk firmware is a down version.
- qualfail = The disk is not supported.
- diskfail = The disk is in a failed state.
- notallflashdisk = The disk does not match the All-Flash Optimized personality of the system.

**[-firmware-revision <text>] - Firmware Revision**

Selects information about disks that have the specified firmware revision level.

**[-home {<nodename>|local}] - Home**

Selects information about disks that have the specified home node.

**[-home-id <nvramid>] - Home System ID**

Selects information about disks whose home node has the specified system ID.

**[-host-adapter <text>] - Primary Path Host Adapter**

Selects information about disks that are currently using the specified Host Bus Adapter.

**[-import-in-progress {true|false}] - Foreign LUN import in progress**

Selects information about the array LUNs that are currently being imported

**[-initiator <text>,...] - Initiator Port**

Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

**[-initiator-iops <integer>,...] - Number of IOPS on Initiator (Rolling Average)**

Selects information about disks that are visible to an initiator that has executed the specified number of IOPs.

**[-initiator-io-kbps <integer>,...] - Kbytes of I/O per second on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

**[-initiator-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this initiator**

Selects information about disks with a path through an initiator that has the specified in-use-count.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Selects information about disks that are visible to an initiator connected to the specified switch port.

**[-is-multidisk-carrier {true|false}] - Multi Disk Carrier?**

Selects information about disks that are located within a multi-disk carrier.

**[-is-local-attach {true|false}] - Indicates If the Disk Is Local to This Cluster**

Selects information about disks attached to the local(true) or remote(false) MetroCluster site.

**[-location {<nodename>|local}] - Physical Location**

Selects information about disks attached to the specified node.

**[-location-id <nvramid>] - The system ID of the node where the disk is attached**

Selects information about disks attached to the node with the specified system ID.

**[-lun <integer>,...] - LUN ID**

Selects information about the specified LUNs.

**[-lun-iops <integer>,...] - Number IOPS per second on disk (Rolling Average)**

Selects information about the LUNs that have reached the specified number of IOPs.

**[-lun-io-kbps <integer>,...] - Kbytes/sec on Disk (Rolling Average)**

Selects information about the LUNs that have reached the specified I/O throughput.

**[-lun-path-use-state <text>,...] - The Use State of the LUN on this path**

Selects information about LUNs reporting the specified in-use state.

**[-model <text>] - Model**

Selects information about disks of the specified model.

**[-odelist {<nodename>|local}] - Controller name**

Selects information about disks that are visible to all of the specified nodes .

**[-outage-reason <text>] - Outage Reason**

Selects information about disks that are not in service for the specified reason. Possible values are: admin failed, admin removed, admin testing, evacuated, bad label, bypassed, failed, init failed, label version, labeled broken, labelmaint, LUN resized, missing, not responding, predict failure, rawsize shrank, recovering, sanitizing, sanitized, SnapLock Disk, testing, unassigned, unknown.

**[-path-error-count <integer>] - Path Error Count**

Selects information about disks that are visible on a path that has incurred the specified number of errors.

**[-path-iops <integer>,...] - Number of IOPS on Path (Rolling Average)**

Selects information about disks on those paths that have reached the specified number of IOPs.

**[-path-io-kbps <integer>,...] - Kbytes of I/O per second on Path (Rolling Average)**

Selects information about disk with paths that have reached the specified I/O throughput

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects information about disks with paths that have incurred the specified number of FC link

errors.

**[-path-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this path**

Selects information about disks with paths that have the specified in-use-count.

**[-path-quality <integer>,...] - Percentage of weighted error threshold**

Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

**[-physical-size-mb <integer>] - Physical Size (MB)**

Selects information about disks that have the specified physical capacity, in megabytes.

**[-physical-size {<integer>[KB|MB|GB|TB|PB]}] - Physical Size**

Selects information about disks that have the specified physical capacity, in human readable units.

**[-physical-size-512b <integer>] - Physical Size in Units of 512 Bytes**

Selects information about disks that have the specified physical capacity, in 512-byte chunks. This parameter is present only for backwards compatibility with Data ONTAP 8.0.

**[-plex <text>] - Plex Name**

Selects information about disks that belong to the specified RAID plex.

**[-pool <text>] - Assigned Pool**

Selects information about disks that belong to the specified SyncMirror pool (pool0 or pool1).

**[-port-speed <text>,...] - Port Speed**

Selects information about disks that are served by a Host Bus Adapter that is running at the specified port speed.

**[-position <diskPositionType>] - Disk Position**

Selects information about disks that have the specified position within their disk container.

**[-power-on-hours <integer>] - Hours Powered On**

Selects information about disks that have the specified number of hours being powered up.

**[-prefailed {true|false}] - Marked for Rapid RAID Recovery?**

Selects information about disks that match the specified parameter value indicating whether the disk is either awaiting or is in process of Rapid RAID Recovery.

**[-preferred-target-port {true|false}] - Whether or not target port group is preferred**

Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Asymmetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

**[-primary-port <text>] - Primary Path Disk Port**

Selects information about disks that use the specified primary port.

**[-raid-group <text>] - Raid Group Name**

Selects information about disks that belong to the specified RAID group.

**[-reconstruction-percent <integer>] - Percentage of Reconstruction Complete**

Selects information about disks that are being reconstructed and that have the specified percentage of the reconstruction operation completed.

**[-replacing {true|false}] - Being Replaced?**

Selects information about disks that match the specified boolean value indicating whether the disk is either awaiting or in process of disk replacement.

**[-reservation-key <text>] - Reservation Key**

If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation key.

**[-reservation-type {rs|we|re|ea|sa|wero|earo|wear|ear|none}] - Reservation Type**

If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation type. Possible values are: rs, we, re, ea, sa, wero, earo, wear, ear, or none.

**[-reserver-id <integer>] - Reservation System ID**

Selects information about disks that are reserved by the node with the specified system ID.

**[-root-owner {<nodename>|local}] - Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition owner name. Used with root-data/root-data1-data2 partitioned disks.

**[-root-owner-id <nvramid>] - Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition owner system ID. Used with root-data/root-data1-data2 partitioned disks.

**[-root-home {<nodename>|local}] - Home Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition home owner name. Used with root-data/root-data1-data2 partitioned disks.

**[-root-home-id <nvramid>] - Home Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition home owner system ID. Used with root-data/root-data1-data2 partitioned disks.

**[-rpm <integer>] - Revolutions Per Minute**

Selects information about disks that have the specified rotational speed.

**[-secondary-name <disk path name>] - Secondary Path Name**

Selects information about disks that use the specified secondary path name, for multipath configuration.

**[-secondary-port <text>] - Secondary Path Disk Port**

Selects information about disks that use the specified secondary port.

**[-serial-number <text>] - Serial Number**

Selects information about the disk that has the specified serial number.

**[-storage-pool <text>] - Storage Pool Name**

Selects information about disks that belong to the specified SSD storage pool.

**[-shelf <integer>] - Shelf**

Selects information about disks that are located within the specified shelf.

**[-shelf-uid <text>] - Shelf UID**

Selects information about disks that are located within a shelf with the specified Shelf UID.

**[-slot <integer>] - Slot**

Selects information about disks that are located in a drawer with the specified slot.

**[-stack-id <integer>] - Stack ID**

A cluster unique id for a collection of one or more interconnected shelves.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects information about disks that are visible on target ports that have performed the specified number of IOPs.

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects information about disks that are visible on target ports that have reached the specified I/O throughput.

**[-target-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this target**

Selects information about disks with a path through a target port that has the specified in-use-count.

**[-target-port-access-state <text>,...] - Failover optimization type**

Selects information about disks that are visible on target ports that have the specified access state.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

**[-target-wwpn <text>,...] - Target Port**

Selects information about disks that are visible on target ports identified by their World Wide Port Name.

**[-tpgn <integer>,...] - Target Port Group Number**

Selects information about disks that belong to the specified Target Port Group Number.

**[-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

Selects information about disks that have the specified disk type.

**[-usable-size-mb <integer>] - Usable Size (MB)**

Selects information about disks that have the specified usable space, in megabytes.

**[-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Usable Size**

Selects information about disks that have the specified usable space, in human readable units.

**[-vendor <text>] - Vendor Name**

Selects information about disks that have the specified vendor.

**[-vmdisk-device-id <integer>,...] - Virtual Disk Device ID**

Selects information about disks that have the specified virtual disk device ID.

**[-zeroed {true|false}] - Zeroed?**

Selects information about disks that have (true) or have not (false) been fully pre-zeroed.

**[-zeroing-percent <integer>] - Percentage of Zeroing Complete**

Selects information about disks that are zeroing and have the specified percentage complete.

**[-carrier-serialno <text>] - Carrier Serial Number**

Selects information about disks that are located within the multi-disk carrier specified by the serial number.

**[-vmdisk-target-address <text>] - Target Address of the VM Disk**

Displays the VM Disk's target address either in the form of bus target lun or bus unit.

**[-path-count <integer>] - Number of Paths to Disk**

Selects information about disks that have the specified number of paths.

**[-hw-minimum-os <ClusterVersion>] - Hardware Minimum Supported ONTAP Version (x.y.z)**

Selects information about disks that have the specified hardware minimum supported ONTAP version in x.y.z format, for example "9.8.0" or "9.9.1".

## Examples

The following example displays information about all disks:

```
cluster1::> storage disk show
Disk                Usable          Container
                   Size Shelf Bay Type          Position  Aggregate Owner
-----
```

- [storage aggregate show-status](#)

# storage disk unfail

Unfail a broken disk

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage disk unfail** command can be used to unfail a broken disk.

If the attempt to unfail the disk is unsuccessful, the disk remains in the broken state.

The disk unfail command prompts for confirmation unless you specify the "-quiet" parameter.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the disk to be unfailed.

### **[-s, -spare <true>] - Make the Disk Spare**

This parameter specifies whether the unfailed disk will be made a spare disk. The disk is forced to become a spare disk if this parameter is specified.

If this parameter is not specified, the disk is brought back into its parent aggregate. Setting this parameter might result in the aggregate coming back online if it is not complete or online. The default value is false.

### **[-q, -quiet <true>] - Confirmations off**

You can set this parameter to true to suppress the confirmation messages. However, before proceeding with the command, you should be aware that the confirmation message contains important information about the effect of unfailed a disk. This command cannot be reversed once it is invoked. The default value is false.

## Examples

The following example unfails a disk named 1.1.16:

```
cluster1::*> storage disk unfail -disk 1.1.16
```

Warning: Failed disk "1.1.16" may have aggregate labels and file system data present. In that case, this command will attempt to bring this disk back into the aggregate with which this disk had formerly been associated and preserve file system data. Are you sure you want to continue with disk unfail? {y|n}:

## storage disk updatefirmware

(DEPRECATED) - Update disk firmware

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future release of Data ONTAP. Use the "[storage disk firmware update](#)" command.

The **storage disk updatefirmware** command updates the firmware on one or more disks.

You can download the latest firmware by using the [storage firmware download](#) command.

You can specify a list of one or more disks whose firmware is to be updated by using the **-disk** parameter, or you can update the firmware on all local disks by omitting the **-disk** parameter.

## Parameters

**[-disk <disk path name>,...] - Disk**

This specifies the disk or disks whose firmware is to be updated.

If you do not specify this option, all local disks' firmware is updated.

## Examples

The following example updates the firmware on all disks:

```
cluster1::> storage disk updatefirmware
```

## Related Links

- [storage disk firmware update](#)
- [storage firmware download](#)

# storage disk zerospares

Zero non-zeroed spare disks

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk zerospares** command zeroes all non-zeroed spare disks in all nodes or a specified node in the cluster. A node must be online to zero disks. This operation must be done before a disk can be reused in another aggregate. This version of ONTAP uses fast zeroing, which converts a spare disk from non-zeroed to zeroed without the long wait times required when physically zeroing a disk.

## Parameters

**[-owner {<nodename>|local}] - Owner**

If this parameter is specified, only non-zeroed spares assigned to the specified node will be zeroed. Otherwise, all non-zeroed spares in the cluster will be zeroed.

## Examples

The following example zeroes all non-zeroed spares owned by a node named node4, using fast zeroing:

```
cluster1::> storage disk zerospares -owner node4
```

## storage disk error show

Display disk component and array LUN configuration errors.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk error show** command displays disk component and array LUN configuration errors.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-uid <text>] - UID**

Displays the error information of the disk whose unique ID matches the value you specify. A disk unique identifier has the form:  
`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000`

**[-array-name <array name>] - Array Name**

Displays the errors of the storage array whose name you specified.

**[-node {<nodename>|local}] - Controller Name**

Displays the error information for the disks on the clustered node whose name you specified.

**[-disk <disk path name>] - Disk**

Displays detailed error information about the disk you specified.

**[-serial-number <text>] - Serial Number**

Displays the error information for the disk whose serial number you specified.

**[-error-id <integer>,...] - Error ID**

Displays the error information for the disks whose Error IDs match IDs you specified.

**[-error-type**

**{onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}] - Error Type**

Displays all disk errors of the error types you specified, grouped by type.

- onepath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.
- foreign = The array LUN is marked as foreign and has some external SCSI reservations other than those from Data ONTAP.
- toobig = The array LUN exceeds the maximum array LUN size that Data ONTAP supports.
- toosmall = The array LUN is less than the minimum array LUN size that Data ONTAP supports.
- invalidblocksize = The array LUN is not a valid block size.
- targetasymmap = The array LUN is presented more than once on a single target port.
- deviceasymmap = The array LUN is presented with multiple IDs.
- failovermisconfig = The array LUN is configured with inconsistent failover methods.
- unknown = The array LUN from a storage array that is not supported by this version of Data ONTAP.
- netapp = A SAN front-end LUN from one Data ONTAP system that is presented as external storage to another Data ONTAP system.
- fwdownrev = The disk firmware is a down version.
- qualfail = The disk is not supported.
- diskfail = The disk is in a failed state.
- notallflashdisk = The disk does not match the All-Flash Optimized personality of the system.

## Examples

The following example displays configuration errors seen in the system:

```
cluster1::> storage disk error show
Disk          Error Type      Error Text
-----
1.02.0        qualfail        This disk failed dynamic disk qualification. Update
the Disk Qaulification Package.
```

# storage disk firmware revert

## Revert disk firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage disk firmware revert** command reverts firmware on all disks or a specified list of disks on a node.

You can specify a list of one or more disks whose firmware is to be reverted by using the **-disk** parameter.

You can revert the firmware on all the disks owned by a node by using the **-node** parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the **storage disk firmware revert** command. This is particularly true for CIFS sessions that might be terminated when this command is executed.

If you need to view the current firmware versions, use the **storage disk show`-fieldsfirmware-revision** command. The following example displays partial output from the **storage disk show`-fields`firmware-revision** command, where the firmware version for the disks is NA02:

```
cluster1::> storage disk show -fields firmware-revision
  disk      firmware-revision
  -----
  1.0.0     NA02
  1.0.1     NA02
  1.0.2     NA02
  1.0.3     NA02
  1.0.4     NA02
  1.0.5     NA02
```

The firmware files are stored in the `/mroot/etc/disk_fw` directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225\_ST336704FC and the firmware version is NA01, the file name is X225\_ST336704FC.NA01.LOD. If the node in this example contains disks with firmware version NA02, the `/mroot/etc/disk_fw/X225_ST336704FC.NA01.LOD` file is downloaded to every disk when you execute this command.

## How to Revert the Firmware for an HA Pair in a Cluster

Use the following procedure to perform a revert on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.

- Download the latest firmware on both nodes by using the [storage firmware download](#) command.
- Revert the disk firmware on Node A's disks by entering the `storage disk firmware revert-node 'node-A'` command.
- Wait until the `storage disk firmware revert` command completes on Node A, and then revert the firmware on Node B's disks by entering the `storage disk firmware revert-node 'node-B'` command.

## Parameters

**{ -disk <disk path name>, ... - Disk Name**

Specifies the disk or disks whose firmware is to be reverted.

**[ -node {<nodename>|local} - Node Name }**

Specifies the node name. The disk firmware will be reverted on all the disks owned by the node specified by this parameter.

## Examples

- The following example reverts the firmware on all disks owned by cluster-node-01:

```
cluster1::*> storage disk firmware revert -node cluster-node-01
```

Warning: Disk firmware reverts can be disruptive to the system. Reverts involve power cycling all of the affected disks, as well as suspending disk I/O to the disks being reverted. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA) group will be delayed until the firmware revert process is complete. Disk firmware reverts should only be done one node at a time. Disk firmware reverts can only be performed when the HA group is healthy; they cannot be performed if the group is in takeover mode.

```
Do you want to continue with disk firmware reverts? {y|n}: y
```

```
Info: Reverting disk firmware for disks on cluster-node-01.
```

- The following example reverts the firmware on disk 1.5.0 which is owned by node cluster-node-04:

```
cluster1::*> storage disk firmware revert -disk 1.5.0
```

Warning: Disk firmware reverts can be disruptive to the system. Reverts involve power cycling all of the affected disks, as well as suspending disk I/O to the disks being reverted. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA) group will be delayed until the firmware revert process is complete. Disk firmware reverts should only be done one node at a time. Disk

```
firmware reverts can only be performed when the HA group is healthy;
they cannot be performed if the group is in takeover mode.

# storage disk firmware show-update-status

Display disk firmware update status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage disk firmware show-update-status** command displays the state of the background disk firmware update process.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node**

Selects the node that matches this parameter value.

**[-num-waiting-download <integer>] - The Number of Disks Waiting to Download**

Selects the nodes whose number of disks waiting to download by the BDFU process matches this parameter value.

**[-total-completion-estimate <integer>] - Estimated Duration to Completion (mins)**

Selects the nodes whose Background Disk Firmware Update (BDFU) completion time estimate matches this parameter value. This indicates the amount of estimated time required for BDFU to complete the firmware update cycle.

**[-average-duration-per-disk <integer>] - Average Firmware Update Duration per Disk (secs)**

Selects the nodes whose BDFU reports the average time required to update a single disk matches this parameter value. This indicates the average amount of time required by each disk drive.

**[-unable-to-update <disk path name>,...] - List of Disks with a Failed Update**

Selects the nodes whose unable to update disk list matches this parameter value. This is a list of disks that failed to update the firmware.

**[-update-status {off|running|idle}] - Background Disk Firmware Update Status**

Selects the nodes whose BDFU process status matches this parameter value. Possible values are:

- off - The BDFU process is off.
- running - The BDFU process is on and currently running.
- idle - The BDFU process is on and is currently idle.

## Examples

```
cluster1::*> storage disk firmware show-update-status
```

Node	Update State	Number Waiting Download	Average Duration /Disk (Sec) Est. (Min)	Total Completion	Unable to Update
node1	running	2	120	4	1.3.3
node2	idle	0	120	0	-
node3	off	0	120	0	-

## storage disk firmware update

### Update disk firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

Use the **storage disk firmware update** command to manually update firmware on all disks or a specified list of disks on a node. However, the recommended way to update disk firmware in a cluster is to enable automatic background firmware update by enabling the **-bkg-firmware-update** parameter for all of the nodes in the cluster. You can do this by entering the storage disk option modify`-node\*-bkg-firmware-update`on command.

You can download the latest firmware on the node by using the storage firmware download command.

You can specify a list of one or more disks whose firmware is to be updated by using the **-disk** parameter.

You can update the firmware on all the disks owned by a node by using the **-node** parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the **storage disk firmware update** command. This is particularly true for CIFS sessions that might be terminated when this command is executed.

The firmware is automatically downloaded to disks, which report previous versions of the firmware. For information on automatic firmware update downloads, see "Automatic versus Manual Firmware Download".

If you need to view the current firmware versions, use the `storage disk show -fields firmware-revision` command. The following example displays partial output from the `storage disk show -fields firmware-revision` command, where the firmware version for the disks is NA01:

```
cluster1::> storage disk show -fields firmware-revision
  disk      firmware-revision
  -----  -
  1.0.0     NA01
  1.0.1     NA01
  1.0.2     NA01
  1.0.3     NA01
  1.0.4     NA01
  1.0.5     NA01
```

The firmware files are stored in the `/mroot/etc/disk_fw` directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID `X225_ST336704FC` and the firmware version is `NA02`, the filename is `X225_ST336704FC.NA02.LOD`. The revision part of the file name is the number against which the node compares each disk's current firmware version. If the node in this example contains disks with firmware version `NA01`, the `/mroot/etc/disk_fw/X225_ST336704FC.NA02.LOD` file is used to update every eligible disk when you execute this command.

#### Automatic versus Manual Firmware Download

The firmware is automatically downloaded to those disks that report previous versions of firmware following a system boot or disk insertion. Note that:

- A manual download is a disruptive operation that makes disks inaccessible for up to five minutes after the download is started. Network sessions that use the node must be terminated before running the **storage disk firmware update** command.
- The firmware is not automatically downloaded to the node's partner node in an HA pair.
- The firmware is not automatically downloaded to unowned disks on nodes configured to use software-based disk ownership.
- The `bkg-firmware-update` parameter controls how the automatic firmware download feature works:
- If the `bkg-firmware-update` parameter is set to `off`, then the **storage disk firmware update** will

update the firmware on the drives in parallel.

- If the `bkg-firmware-update` parameter is set to on, then the **storage disk firmware update** will update spares and filesystem disks in a nondisruptive manner in the background after boot. Firmware downloads for these disks will be done sequentially by temporarily taking them offline one at a time for the duration of the download. After the firmware is updated, the disk will be brought back online and restored to its normal operation.

During an automatic download to an HA environment, the firmware is not downloaded to the disks owned by the HA partner.

When you use the **storage disk firmware update** command, the firmware is:

- Updated on every disk regardless of whether it is on the A-loop, the B-loop, or in an HA environment.
- If the node is configured in a software-based disk ownership system, only disks owned by this node are updated.

During an automatic firmware download in a MetroCluster™ environment, the firmware is not downloaded to the disks owned by the partner cluster. During both manual and automatic firmware download in a MetroCluster-over-IP environment, the firmware is not downloaded to any remote disks located at the partner cluster while Disaster Recovery is in progress.

Follow the instructions in "How to Update the Firmware for an HA Pair in a Cluster" to ensure that the updating process is successful. Data ONTAP supports redundant path configurations for disks in a non-HA configuration. The firmware is automatically downloaded to disks on the A-loop or B-loop of redundant configurations that are not configured in an HA pair and are not configured to use software-based disk ownership.

### Automatic Background Firmware Update

The firmware can be updated in the background so that the firmware update process does not impact the clients. This functionality is controlled with the `bkg-firmware-update` parameter. You can modify the parameter by using the CLI `storage disk option modify`-nodenode_name-bkg-firmware-update`on|off` command. The default value for this parameter is "on".

When disabled or set to "off", **storage disk firmware update** will update the firmware in automated mode. This means that all disks which had older firmware revision will be updated regardless of whether they are spare or filesystem disks.

When enabled or set to "on", the background **storage disk firmware update** will update firmware in automated mode only on disks that can be successfully taken offline from active filesystem RAID groups and from the spare pool. To ensure a faster boot process, the firmware is not downloaded to spares and filesystem disks at boot time.

This provides the highest degree of safety available, without the cost of copying data from each disk in the system twice. Disks are taken offline one at a time and then the firmware is updated on them. The disk is brought online after the firmware update and a mini/optimized reconstruct happens for any writes, which occurred while the disk was offline. Background disk firmware update will not occur for a disk if its containing RAID group or the volume is not in a normal state (for example, if the

volume/plex is offline or the RAID group is degraded). However, due to the continuous polling nature of background disk firmware update, firmware updates will resume after the RAID group/plex/volume is restored to a normal mode. Similarly, background disk firmware updates are suspended for the duration of any reconstruction within the system.

## How to Update the Firmware for an HA Pair in a Cluster

The best way to update the firmware in a cluster with HA pairs is to use automatic background firmware update by enabling the option `bkg-firmware-update` parameter for each node. Enable the `-bkg-firmware-update` parameter on all the nodes by entering the `storage disk option modify`-nodenode_name-bkg-firmware-update`on` command. Alternatively, use the following procedure to successfully perform a manual update on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both the nodes by using the `storage firmware download` command.
- Install the new disk firmware on Node A's disks by entering the `storage disk firmware update -node`node-A`` command.
- Wait until the `storage disk firmware update` command completes on Node A, and then install the new disk firmware on Node B's disks by entering the `storage disk firmware update-node`node-B`` command.

## Parameters

`{ -disk <disk path name>, ... - Disk`

Specifies the disk or disks whose firmware is to be updated.

`| -node {<nodename>|local} - node }`

Specifies the node name. The disk firmware will be updated on all the disks owned by the node specified by this parameter.

## Examples

- The following example updates the firmware on all disks owned by cluster-node-01:

```
cluster1::*> storage disk firmware update -node cluster-node-01
```

Warning: Disk firmware updates can be disruptive to the system. Updates involve power cycling all of the affected disks, as well as suspending disk I/O to the disks being updated. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA) group will be delayed until the firmware update process is complete. Disk firmware updates should only be done one node at a time. Disk firmware updates can only be performed when the HA group is healthy; they cannot be performed if the group is in takeover mode.

```
Do you want to continue with disk firmware updates? {y|n}: y
```

```
Info: Updating disk firmware for disks on cluster-node-01.
```

- The following example updates the firmware on disk 1.5.0 which is owned by node cluster-node-04:

```
cluster1::*> storage disk firmware update -disk 1.5.0
```

```
Warning: Disk firmware updates can be disruptive to the system. Updates involve power cycling all of the affected disks, as well as suspending disk I/O to the disks being updated. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA) group will be delayed until the firmware update process is complete. Disk firmware updates should only be done one node at a time. Disk firmware updates can only be performed when the HA group is healthy; they cannot be performed if the group is in takeover mode.

# storage disk option modify

## Modify disk options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage disk option modify** command modifies the background firmware update setting, automatic copy setting, controls automatic disk assignment of all disks assigned to a specified node, or modifies the policy of automatic disk assignment of unowned disks.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node that owns the disks whose options are to be modified.

**[-bkg-firmware-update {on|off}] - Background Firmware Update**

This parameter specifies whether firmware updates run as a background process. The default setting is **on**, which specifies that firmware updates to spare disks and file system disks is performed nondisruptively via a background process. If the option is turned off, automatic firmware updates occur at system startup or during disk insertion.

**[-autocopy {on|off}] - Auto Copy**

This parameter specifies whether data is to be automatically copied from a failing disk to a spare disk in the event of a predictive failure. The default setting is **on**. It is sometimes possible to predict a disk failure based on a pattern of recovered errors that have occurred. In such cases, the disk reports a predictive failure. If this option is set to **on**, the system initiates Rapid RAID Recovery to copy data from the failing disk to an available spare disk. When data is copied, the disk is marked as failed and placed in the pool of broken disks. If a spare is not available, the node continues to use the disk until it fails. If the option is set to **off**, the disk is immediately marked as failed and placed in the pool of broken disks. A spare is selected and data from the missing disk is reconstructed from other disks in the RAID group. The disk does not fail if the RAID group is already degraded or is being reconstructed. This ensures that a disk failure does not lead to the failure of the entire RAID group.

**[-autoassign {on|off}] - Auto Assign**

This parameter specifies whether automatic assignment of unowned disks is enabled or disabled. The default setting is **on**. This parameter is used to set both a node-specific and a cluster-wide disk option.

**[-autoassign-policy {default|bay|shelf|stack}] - Auto Assignment Policy**

This parameter defines the granularity at which auto assign should work. This option is ignored if the **-autoassign** option is off. Auto assignment can be done at the stack/loop, shelf, or bay level. The possible values for the option are **default**, **stack**, **shelf**, and **bay**. The default value is platform dependent. It is **stack** for all non-entry platforms and single-node systems, whereas it is **bay** for entry-level platforms.

## Examples

The following example sets the background firmware update setting to **on** for all disks belonging to a node named **node0**:

```
cluster1::> storage disk option modify -node node0 -bkg-firmware-update on
```

The following example shows how to enable auto assignment for the disks on **node1**:

```
cluster1::> storage disk option modify -node node1 -autoassign on
cluster1::> storage disk option show
```

Node	BKg. FW. Upd.	Auto Copy	Auto Assign	Auto Assign Policy
node1	on	on	on	default
node2	on	on	off	default

```
2 entries were displayed.
```

The following example shows how to modify the auto assignment policy on node1:

```
cluster1::> storage disk option modify -node node1 -autoassign-policy bay
cluster1::> storage disk option show
Node           Bkg. FW. Upd.  Auto Copy      Auto Assign     Auto Assign Policy
-----
node1          on              on              on              bay
node2          on              on              off             default
2 entries were displayed.
```

## storage disk option show

Display a list of disk options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage disk option show** command displays the settings of the following disk options:

- Background firmware update
- Automatic copying of data to a spare disk in the event of a predictive failure
- Automatic assignment of disks
- Policy that governs automatic assignment of unowned disks

### Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{ [-instance ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

{ [-node {<nodename>|local}] - Node

Selects the node that owns the disks. If this parameter is not specified, the command displays information about the disk options on all the nodes.

{ [-bkg-firmware-update {on|off}] - Background Firmware Update

Selects the disks that match this parameter value.

**[-autocopy {on|off}] - Auto Copy**

Selects the disks that match this parameter value.

**[-autoassign {on|off}] - Auto Assign**

Displays the auto assignment status of unowned disks. The default value is **on** .

**[-autoassign-policy {default|bay|shelf|stack}] - Auto Assignment Policy**

Selects the disks that match the automatic assignment policy value:

- Default
- Stack/loop
- Shelf
- Bay

## Examples

The following example displays disk-option settings for disks owned by all nodes in the cluster:

```
cluster1::> storage disk option show
Node          BKg. FW. Upd.  Auto Copy    Auto Assign  Auto Assign Policy
-----
node0         on             on           on           default
node1         on             on           on           stack
node2         on             on           on           bay
node3         on             on           on           bay
4 entries were displayed.
```

## storage dqp show

Display Disk Qualification Package details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage dqp show** command displays information about the Disk Qualification Package (DQP). The command displays the following information:

- Node Name
- Package Date
- File Version
- File Name
- Drive Record Count

- Drive Alias Record Count
- Device Class Record Count
- System Class Record Count

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**{ [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays DQP information on the specified node.

**[-package-date <text>] - Package Date**

Selects DQP information with the specified package date.

**[-file-version <text>] - File Version**

Selects DQP information with the specified file version.

**[-filename <text>] - File Name**

Selects DQP information with the specified file name.

**[-drive-records <integer>] - Drive Record Count**

Selects DQP information with the specified drive record count.

**[-alias-records <integer>] - Alias Record Count**

Selects DQP information with the specified drive alias record count.

**[-device-records <integer>] - Device Record Count**

Selects DQP information with the specified device class record count.

**[-system-records <integer>] - System Record Count**

Selects DQP information with the specified system class record count.

## Examples

The following example displays the brief version of Disk Qualification Package details:

```
cluster1::> storage dqp show
  Node           Package Date   Version
-----
cluster1-01    20180907      3.17
```

```
cluster1-02  20180907  3.17
2 entries were displayed.
```

The following example displays the `-instance` version of Disk Qualification Package details:

```
cluster1::> storage dqp show -instance
Node: cluster1-01
    Package Date: 20180907
        Version: 3.17
            File Name: qual_devices_v3
                Drive Record Count: 626
                Alias Record Count: 196
                Device Record Count: 28
                System Record Count: 3
Node: cluster1-02
    Package Date: 20180907
        Version: 3.17
            File Name: qual_devices_v3
                Drive Record Count: 626
                Alias Record Count: 196
                Device Record Count: 28
                System Record Count: 3
2 entries were displayed.
```

## storage encryption disk destroy

Cryptographically destroy a self-encrypting disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage encryption disk destroy** command cryptographically destroys a self-encrypting disk (SED), making it incapable of performing I/O operations. This command performs the following operations:

- Employs the inherent erase capability of SEDs to cryptographically sanitize the disk
- Permanently locks the disk to prevent further data access
- Changes the data and FIPS authentication keys to random values that are not recorded except within the SED.

Use this command with extreme care. The only mechanism to restore the disk to usability (albeit without the data) is the [storage encryption disk revert-to-original-state](#) operation that is available only on disks that have the physical secure ID (PSID) printed on the disk label.

The destroy command requires you to enter a confirmation phrase before proceeding with the

operation.

The command releases the cluster shell after launching the operation. Monitor the output of the `storage encryption disk show-status` command for command completion.

Upon command completion, remove the destroyed SED from the system.

## Parameters

### `-disk <disk path name>` - Disk Name

This parameter specifies the name of the disk you want to cryptographically destroy. See the man page for the `storage disk modify` command for information about disk-naming conventions.

### `[-force-all-states <true>]` - Destroy All Matching Disks

When this parameter is **false** or not specified, the operation defaults to spare and broken disks only, as reported in the output of the `storage disk show` command. When you specify this parameter as **true**, it allows you to cryptographically destroy all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick destroy of all system disks if you use the `-disk` parameter with the asterisk wildcard (\*). If you destroy active disks, the nodes might not be able to continue operation, and might halt or panic.

## Examples

The following command cryptographically destroys the disk 1.10.20:

```
cluster1::> storage encryption disk destroy 1.10.20
```

```
Warning: This operation will cryptographically destroy 1 spare or broken
self-encrypting disks on 1 node.
You cannot reuse destroyed disks unless you revert
them to their original state using the PSID value.
To continue, enter
destroy disk
:destroy disk
```

```
Info: Starting destroy on 1 disk.
View the status of the operation by using the
"storage encryption disk show-status" command.
```

```
cluster1::>
```

If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk destroy 1.10.2*
```

```
Warning: This operation will cryptographically destroy 5 spare or broken
self-encrypting disks on 1 node.
```

```
You cannot reuse destroyed disks unless you revert
them to their original state using the PSID value.
To continue, enter
  destroy disk
:yes
No disks destroyed.

cluster1::>
```

The following command quickly cryptographically destroys all system disks, including those in active use in aggregates and shared devices:

```
cluster1::> storage encryption disk destroy -force-all-states -disk *

Warning: This operation will cryptographically destroy 96
self-encrypting disks on 4 nodes.
To continue, enter
  destroy disk
:destroy disk

Info: Starting destroy on 96 disks.
View the status of the operation by using the
<<storage-encryption-disk-show-status,storage encryption disk show-status>>
command.

cluster1::>
```

# storage encryption disk modify

Modify self-encrypting disk parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage encryption disk modify** command changes the data protection parameters of self-encrypting disks (SEDs) and FIPS-certified SEDS (FIPS SEDs); it also modifies the FIPS-compliance AK (FIPS AK) of FIPS SEDs. The current data AK and FIPS AK of the device are required to effect changes to the respective AKs and FIPS compliance. The current and new AKs must be available from the key

servers or onboard key management.

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

To properly protect data at rest on a FIPS SED and place it into compliance with its FIPS certification requirements, set both the Data and FIPS AKs to a value other than the device's default key; depending on the device type, the default may be manufacture secure ID (MSID), indicated by a key ID with the special value **0x0**, or a null key represented by a blank key ID. Verify the key IDs by using the [storage encryption disk show](#) and [storage encryption disk show -fips](#) commands.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the name of the SED or FIPS SED that you want to modify.

### **{ [-data-key-id <text>] - Key ID of the New Data Authentication Key**

This parameter specifies the key ID associated with the data AK that you want the SED to use for future authentications. When the provided key ID is the MSID, data at rest on the SED is not protected from unauthorized access. Setting this parameter to a non-MSID value automatically engages the power-on-lock protections of the device, so that when the device is power-cycled, the system must authenticate with the device using the AK to reenables I/O operations. You cannot specify the null default key; use MSID instead.

### **[ [-fips-key-id <text>] - Key ID of the New Authentication Key for FIPS Compliance }**

This parameter specifies the key ID associated with the FIPS AK that you want the FIPS SED to apply to SED credentials other than the one that protects the data. When the value is not the MSID, these credentials are changed to the indicated AK, and other security-related items are set to conform to the FIPS certification requirements ("FIPS compliance mode") of the device. You may set the **-fips-key-id** to any one of the key IDs known to the system. The FIPS key ID may, but does not have to, be the same as the data key ID parameter. Setting **-fips-key-id** to the MSID key ID value disables FIPS compliance mode and restores the FIPS-related authorities and other components as required (other than data) to their default settings. A nonMSID FIPS-compliance key may be applied only to a FIPS SED.

## Examples

The following command changes both the AK and the power-cycle protection to values that protect the data at rest on the disk. Note that the **-data-key-id** and **-fips-key-id** parameters require one of the key IDs that appear in the output of the [security key-manager query](#) command.

```
cluster1::> storage encryption disk modify -data-key-id
6A1E21D80000000010000000000000F5A1EB48EF26FD6A8E76549C019F2350 -disk 2.10.*
```

Info: Starting modify on 14 disks.  
View the status of the operation by using the

```
storage encryption disk show-status command.
```

The following command changes the FIPS AK and sets the device into FIPS-compliance mode. Note that the **-fips-key-id** parameter requires one of the key IDs that appear in the output of the [security key-manager query](#) command.

```
cluster1::> storage encryption disk modify -fips-key-id  
6A1E21D800000000100000000000005A1FB4EE8F62FD6D8AE6754C9019F35A 2.10.*
```

Info: Starting modify on 14 disks.  
View the status of the operation by using the  
storage encryption disk show-status command.

# storage encryption disk revert-to-original-state

Revert a self-encrypting disk to its original, as-manufactured state

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Some self-encrypting disks (SEDs) are capable of an operation that restores them as much as possible to their as-manufactured state. The **storage encryption disk revert-to-original-state** command invokes this special operation that is available only in SEDs that have the physical secure ID (PSID) printed on their labels.

The PSID is unique to each SED, meaning the command can revert only one SED at a time. The disk must be in a "broken" or "spare" state as shown by the output of the [storage disk show](#) command.

The operation in the SED accomplishes the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) and FIPS AK to the default values
- Resets the data locking controls
- Resets the power-on lock state to **false**

- Initializes other vendor-unique encryption-related parameters

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

When the operation is complete, it is possible to return the SED to service using the [storage disk unfail](#) command in **advanced** privilege mode. To do so, you might also need to reestablish ownership of the SED using the [storage disk assign](#) command.

## Parameters

### **-disk <disk path name> - Disk Name**

The name of the SED to be reverted to its as-manufactured state. See the man page for the [storage disk modify](#) command for information about disk-naming conventions.

### **-psid <text> - Physical Secure ID**

The PSID printed on the SED label.

## Examples

The following command shows a SED being returned to its as-manufactured state:

```
cluster1::> storage encryption disk revert-to-original-state -disk 01.10.0 -psid
AC65PYF8CG45YZABUQJKM98WV2VZGRLD
```

- [storage disk unfail](#)
- [storage disk assign](#)

# storage encryption disk sanitize

Cryptographically sanitize a self-encrypting disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage encryption disk sanitize** command cryptographically sanitizes one or more self-encrypting disks (SEDs), making the existing data on the SED impossible to retrieve. This operation employs the inherent erase capability of SEDs to perform all of the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) to the default AK (manufacture secure ID/MSID or null, depending on the device type)
- Unlocks the data band
- Resets the power-on lock state to **false**

There is no method to restore the disk encryption key to its previous value, meaning that you cannot recover the data on the SED. Use this command with extreme care.

The sanitize command requires you to enter a confirmation phrase before proceeding with the operation.

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

When the operation is complete, it is possible to return the SED to service using the [storage disk unfaul](#) command in **advanced** privilege mode. To do so, you might also need to reestablish ownership of the SED using the [storage disk assign](#) command.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the name of the SEDs you want to cryptographically sanitize. See the man page for the **storage disk modify** command for information about disk-naming conventions.

### **[-force-all-states <true>] - Sanitize All Matching Disks**

When this parameter is **false** or not specified, the operation defaults to spare and broken disks only, as reported in the output of the [storage disk show](#) command. When you specify this parameter as **true**, it allows you to cryptographically sanitize all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick erasure of all system data if you use the **-disk** parameter with the asterisk wildcard (\*). If you sanitize active disks, the nodes might not be able to continue operation, and might halt or panic.

## Examples

The following command sanitizes the disk 1.10.20:

```
cluster1::> storage encryption disk sanitize 1.10.20
```

```
Warning: This operation will cryptographically sanitize 1 spare or broken  
self-encrypting disk on 1 node.
```

```
To continue, enter  
  sanitize disk  
:sanitize disk
```

```
Info: Starting sanitize on 1 disk.
```

```
View the status of the operation using the
<<storage-encryption-disk-show-status,storage encryption disk show-status>>
command.
```

```
cluster1::>
```

If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk sanitize 1.10.2*
```

```
Warning: This operation will cryptographically sanitize 5 spare or broken
self-encrypting disks on 1 node.
```

```
To continue, enter
sanitize disk
```

```
:yes
```

```
No disks sanitized.
```

```
cluster1::>
```

The following command quickly cryptographically sanitizes all system disks, including those in active use in aggregates and shared devices:

```
cluster1::> storage encryption disk sanitize -force-all-states -disk *
```

```
Warning: This operation will cryptographically sanitize 96
self-encrypting disks on 4 nodes.
```

```
To continue, enter
sanitize disk
```

```
:sanitize disk
```

```
Info: Starting sanitize on 96 disks.
```

```
View the status of the operation by using the
<<storage-encryption-disk-show-status,storage encryption disk show-status>>
command.
```

```
cluster1::>
```

- [storage disk assign](#)
- [storage disk show](#)

# storage encryption disk show-status

Display status of disk encryption operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage encryption disk show-status** command displays the results of the latest **destroy**, **modify**, or **sanitize** operation of the **storage encryption disk** command family. Use this command to view the progress of these operations on self-encrypting disks (SEDs).

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node <nodename> ] - Node Name**

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter.

**[ -is-fips-support {true|false} ] - Node Supports FIPS Disks**

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter (**true** means the node supports FIPS-certified self-encrypting drives).

**[ -latest-op <Storage Disk Encryption Operation> ] - Latest Operation Requested**

If you specify this parameter, the command displays disk encryption status for the nodes with a most recent **storage encryption disk** operation that matches this parameter (one of **destroy**, **modify**, **revert-to-original-state**, **sanitize**, or **unknown**).

**[ -op-start-time <MM/DD/YYYY HH:MM:SS> ] - Operation Start Time**

Selects the nodes with operation start times that match this parameter.

**[ -op-execute-time <integer> ] - Execution Time in Seconds**

If you specify this parameter, the command displays disk encryption status for the nodes with operation execution time that matches this parameter. The operation may be partial or completed.

**[ -disk-start-count <integer> ] - Number of Disks Started**

If you specify this parameter, the command displays disk encryption status for the nodes that started this number of SEDs in their latest operation.

**[-disk-done-count <integer>] - Number of Disks Done**

Selects the nodes that report this number of SEDs having completed the latest operation, successfully or not.

**[-disk-success-count <integer>] - Number of Disks Successful**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that successfully completed the latest operation. When the operation is finished, if the success count is not the same as the started count, some additional detail is available using the **-instance** or **-node** parameters.

**[-disk-no-key-id-count <integer>] - Number of Disks with Key ID Not Found**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because Data ONTAP could not find the Key IDs associated with the required authentication key of the SED.

**[-disk-no-authent-count <integer>] - Number of Disks Not Authenticated**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because the identified Authentication Key could not authenticate with the SED.

**[-op-sequence-count <integer>] - Sequence Count of Latest Operation**

If you specify this parameter, the command displays disk encryption status for that nodes that match the value list.

## Examples

When no operation has been requested since node boot, the status for that node is empty. If you enter a node name, the output is in the same format as for the **-instance** parameter.

```
cluster1::> storage encryption disk show-status -node node
Node Name: node
  Node Supports FIPS-certified Self-Encrypting Disks: true
    Latest Operation Requested: unknown
      Operation Start Time: -
    Execution Time in Seconds: -
      Number of Disks Started: -
    Number of Disks Done: -
      Number of Disks Successful: -
    Number of Disks with Key ID Not Found: -
      Number of Disks Not Authenticated: -
```

Once an operation begins, the status is dynamic until all devices have completed. When disks are modified, sanitized, or destroyed, sequential executions of **storage encryption disk show-status** appear as in this example that shows the progress of a modify operation on three SEDs on each node of a two-node cluster:

```

cluster1::> storage encryption disk show-status
      SED      Latest  Start          Execution  Disks  Disks      Disk
Node   Support Request  Timestamp      Time (sec)  Begun   Done  Successful
-----
node   true   modify  9/22/2014 13:58:53      4      3      0      0
node1  true   modify  9/22/2014 13:58:53      4      3      0      0

cluster1::> storage encryption disk show-status
      SED      Latest  Start          Execution  Disks  Disks      Disk
Node   Support Request  Timestamp      Time (sec)  Begun   Done  Successful
-----
node   true   modify  9/22/2014 13:58:53      7      3      3      3
node1  true   modify  9/22/2014 13:58:53      7      3      3      3

```

## storage encryption disk show

Display self-encrypting disk attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage encryption disk show** command displays information about encrypting drives. When no parameters are specified, the command displays the following information about all encrypting drives:

- Disk name
- The protection mode of the device
- The key ID associated with the data authentication key ("data AK")

In MetroCluster systems, the information is valid from the cluster that owns the drive, or from the DR cluster when in switchover mode. If information is not available, perform the **show** command from the cluster partner.

You can use the following parameters together with the **-disk** parameter to narrow the selection of displayed drives or the information displayed about them.

### Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-fips ]**

If you specify this parameter, the command displays the key ID associated with the FIPS-

compliance authentication key ("FIPS AK") instead of the data key ID.

### **[`-instance`] }**

If you specify this parameter, the command displays detailed disk information about all disks, or only those specified by a `-disk` parameter.

### **[`-disk <disk path name>`] - Disk Name**

If you specify this parameter, the command displays information about the specified disks. If you specify a single disk path name, the output is the same as when you use the `-instance` parameter. See the man page for the `storage disk modify` command for information about disk-naming conventions. Default is all self-encrypting disks.

### **[`-container-name <text>`] - Container Name**

This parameter specifies the container name associated with an encrypting drive. If you specify an aggregate name or other container name, only the encrypting drives in that container are displayed. See the man page for the `storage disk show` command for a description of the container name. Use the `storage aggregate show-status` and `storage disk show` commands to determine which aggregates the drives are in.

### **[`-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}`] - Container Type**

This parameter specifies the container type associated with an encrypting drive. If you specify a container type, only the drives with that container type are displayed. See the man page for the `storage disk show` command for a description of the container type.

### **[`-data-key-id <text>`] - Key ID of the Current Data Authentication Key**

This parameter specifies the key ID associated with the data AK that the encrypting drive requires for authentication with its data-protection authorities. The special key ID `0x0` indicates that the current data AK of the drive is the default manufacture secure ID (MSID) that is not secret. Some devices employ an initial null default AK that appears as a blank data-key-id; you cannot specify a null data-key-id value. To properly protect data at rest on the device, modify the data AK using a key ID that is not a default value (MSID or null). When you modify the data AK with a non-MSID key ID, the system automatically sets the device's power-on lock enable control so that authentication with the data AK is required after a device power-cycle. Use `storage encryption disk modify`-data-key-id`key-id to protect the data. Use storage encryption disk modify-fips -key-id`key-id to place the drives into FIPS-compliance mode.`

### **[`-fips-key-id <text>`] - Key ID of the Current FIPS Authentication Key**

This parameter specifies the key ID associated with the FIPS authentication key ("FIPS AK") that the system must use to authenticate with FIPS-compliance authorities in FIPS-certified drives. This parameter may not be set to a non-MSID value in drives that are not FIPS-certified.

### **[`-is-power-on-lock-enabled {true|false}`] - Is Power-On Lock Protection Enabled?**

This parameter specifies the state of the control that determines whether the encrypting drive requires authentication with the data AK after a power-cycle. The system enables this control parameter automatically when you use the `storage encryption disk modify`-data-key-id`` command to set the data AK to a value other than the default AK. Data is protected only when

this parameter is **true** and the data AK is not a default. Compare with the values of the **-protection-mode** parameter below.

### **[-protection-mode <text>] - Mode of SED Data and FIPS-Compliance Protection**

The protection mode that the drive is in:

- open - data is unprotected; drive is not in FIPS-compliance mode
- data - data is protected; drive is not in FIPS-compliance mode
- part - data is unprotected; drive is otherwise in FIPS-compliance mode
- full - data is protected; drive is in FIPS-compliance mode
- miss - protection mode information is not available

### **[-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

This parameter selects the drive type to include in the output.

### **[-control-standard <text>] - Control Standard**

This parameter specifies the industry standard for control of encrypting drives that the drive implements.

### **[-compliance-standard <text>] - Compliance Standard**

This parameter specifies the industry compliance standard, if any, that the drive is certified as adhering to.

### **[-overall-security <text>] - Overall Security**

This parameter specifies the drive's certified security level as defined in the compliance-standard, if the drive is certified to a compliance standard.

## Examples

The following command displays information about all encrypting drives:

```
cluster1::> storage encryption disk show
Disk    Mode Data Key ID
-----
0.0.0   open 0x0
0.0.1   part 0x0
0.0.2   data 0A9C9CFC0000000001000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.0  open 0A53ED2A0000000001000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
1.10.1  part 0A9C9CFC0000000001000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2  full 0A9C9CFC0000000001000000000000345CFD1BAD310CA8EDB377D439FB5C9A
[...]
```

Note in the example that only disk 1.10.2 is fully protected with FIPS mode, power-on-lock enable, and an AK that is not the default MSID or a null key.

The following command displays information about the protection mode and FIPS key ID for all encrypting drives:

```
cluster1::> storage encryption disk show -fips
Disk      Mode FIPS-Compliance Key ID
-----
0.0.0    open 0x0
0.0.1    part 0A53ED2A000000000100000000000000C1B27AD3F0DB8891375AED2F34D0BBED
0.0.2    data 0x0
1.10.0   open 0A53ED2A000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
1.10.1   part 0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2   full 0A9C9CFC000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
[...]
```

Note again that only disk 1.10.2 is fully protected with FIPS-compliance mode set, power-on-lock enabled, and a data AK that is not the default MSID or a null key.

The following command displays the individual fields for disk 1.10.2:

```
cluster1::> storage encryption disk show -disk 1.10.2
Disk Name: 1.10.2
                                Container Name: aggr0
                                Container Type: shared
                                Is Drive FIPS-certified?: true
Key ID of the Current Data Authentication Key:
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
Key ID of the Current FIPS Authentication Key:
0A9C9CFC000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
                                Is Power-On Lock Protection Enabled?: true
Mode of Data and FIPS-Compliance Protection: full
                                Drive Type: SSD
                                Control Standard: TCG Enterprise
                                Compliance Standard: FIPS 140-2
                                Overall Security: Level 2
```

## storage errors show

Display storage configuration errors.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage errors show` command displays configuration errors with back end storage arrays.

## Parameters

**{[-fields <fieldname>,...]}**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[-instance ]}**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-uid <text>] - UID**

Selects the disks that match this parameter value.

**[-array-name <array name>] - Array Name**

Selects the disks that have the specified name for the storage array that is connected to the cluster.

**[-node {<nodename>|local}] - Controller Name**

Selects the disks that match this parameter value.

**[-disk <disk path name>] - Disk**

Selects the disks that match this parameter value.

**[-serial-number <text>] - Serial Number**

Selects the disks that match this parameter value.

**[-error-id <integer>,...] - Error ID**

Selects the disks with error-id values that match this parameter value.

**[-error-type**

**{onpath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}] - Error Type**

Selects the disks with error types values that match this parameter value.

## Examples

The following example displays configuration errors seen in the system:

```
cluster1::> storage errors show
Disk: vnv3070f20b:vnci9124s54:1-24.126L23
```

```
-----  
vnci9124s54:1-24.126L23 (600a0b800019e999000036b24bac3983): This array LUN reports an  
invalid block size and is not usable. Only a block size of 512 is supported.
```

# storage failover giveback

Return failed-over storage to its home node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage failover giveback** command returns storage that has failed over to a node's partner back to the home node. This operation fails if other resource-intensive operations (for instance, system dumps) are running and make the giveback operation potentially dangerous or disruptive. Some options are available only at the advanced privilege level and higher. Run the **storage failover show-giveback** command to check the status of giveback operations.

NOTE:

- If the system ID of the partner has changed while the node is in takeover mode, the **storage failover giveback** command updates the ownership of the partner's disks to the new system ID while giving back.
- If the giveback operation fails due to the operation being vetoed by a subsystem, check the syslog or EMS output for a subsystem-specific reason for the abort. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by the subsystem and then reissue the **storage failover giveback** command. If you cannot perform the corrective action, then use the **override-vetoes** option in the **storage failover giveback** command to force the giveback.
- If the giveback operation fails because the node cannot communicate with its partner, check the EMS output for the corrective action. Follow the corrective action and then reissue the **storage failover giveback** command. If you cannot perform the corrective action, then use the **-require-partner-waiting false** option in the **storage failover giveback** command to force the giveback. This parameter is available only at the advanced privilege level and higher.
- If the node does not receive notification that the partner has brought online the given-back aggregate and its volumes, the **storage failover show-giveback** command displays the giveback status for the aggregate as failed. A possible reason for this failure is that the partner is overloaded and slow in bringing the aggregate online. Run the **storage aggregate show** command to verify that the aggregate and its volumes are online on the partner node. The node will not attempt the giveback operation for remaining aggregates. To force the giveback, use the **-require-partner-waiting false** option in the **storage failover giveback** command. This parameter is available only at the advanced privilege level and higher.

## Parameters

### { **-ofnode** {<nodename>|local} - Node to which Control is Givenback

Specifies the node whose storage is currently taken over by its partner and will be given back by the giveback operation.

### [ **-fromnode** {<nodename>|local} - Node Initiating Giveback }

Specifies the node that currently holds the storage that is to be returned to the partner node.

### [**-require-partner-waiting** {true|false}] - Require Partner in Waiting

If this optional parameter is used and set to false, the storage is given back regardless of whether the partner node is available to take back the storage or not. If this parameter is used and set to true, the storage will not be given back if the partner node is not available to take back the storage. If this parameter is not used, the behavior defaults to the setting of the **-check-partner** option set with the [storage failover modify](#) command.

### [**-override-vetoes** <true>] - Override All Vetoes

If this optional parameter is used, the system overrides veto votes during a giveback operation. If this parameter is not used, the system does not proceed with a giveback if it is vetoed. This parameter, if used, can only be set to true.

### [**-only-cfo-aggregates** <true>] - Giveback Only CFO Aggregates

If this optional parameter is used, giveback of only the CFO aggregates (root aggregate and CFO style data aggregates) will be attempted. If this parameter is not used, giveback of all the aggregates (CFO and SFO aggregates) will be attempted. This parameter, if used, can only be set to true.

## Examples

The following example gives back storage that is currently held by a node named node1. The partner must be available for the giveback operation to occur.

```
node::> storage failover giveback -fromnode node1
```

The following example gives back only the CFO aggregates to a node named node2 (the aggregates are currently held by a node named node1). The partner must be available for the giveback operation to occur, and the veto-giveback process can be overridden.

```
node::> storage failover giveback -ofnode node2  
-override-vetoes true -only-cfo-aggregates true
```

# storage failover modify

Modify storage failover attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage failover modify** command changes the storage-failover options for a node. Some options are available only at the advanced privilege level and higher.

## Parameters

### **-node {<nodename>|local} - Node**

This specifies the node whose storage-failover options are to be modified.

### **{ [-enabled {true|false}] - Takeover Enabled**

This optionally specifies whether storage failover is enabled. The default setting is **true** .

### **[ -mode {ha|non\_ha}] - HA Mode }**

This specifies whether the node is set up in high-availability mode or stand-alone mode. If the node is a member of a high-availability configuration, set the value to **ha** . If the node is stand-alone, set the value to **non\_ha** . Before setting the HA mode, you must complete the platform dependent steps to set up the system in a stand-alone or HA configuration as shown in the documentation for your platform.

### **[-auto-giveback {true|false}] - Auto Giveback Enabled**

This optionally specifies whether automatic giveback operations are enabled. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation. The default setting is **true** . This parameter is not applicable if takeover was because of a disruption in the partner's operation. For those cases, use the **-auto-giveback-after-panic** parameter, instead.

### **[-detection-time <integer>] - Takeover Detection Time (secs)**

This optionally specifies the amount of time, in seconds, that a node remains unresponsive before its partner initiates a takeover operation. Possible values range from 10 to 180 seconds. The default setting is 15 seconds.

### **[-onfailure {true|false}] - Takeover on Failure Enabled**

This optionally specifies whether the node automatically takes over for its partner node if the partner node fails. The default setting is **true** .This parameter is available only at the advanced privilege level and higher.

**[-onpanic {true|false}] - Takeover on Panic Enabled**

This optionally specifies whether the node automatically takes over for its partner node if the partner node panics. The default setting is **true** . Changing this parameter on one node automatically makes the same change on its partner node.

**[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled**

This optionally specifies whether the node takes over for its partner node if the partner node fails within 60 seconds of starting up; the time period is modifiable by using the **-short-uptime** parameter. The default setting is **true** . This parameter is available only at the advanced privilege level and higher.

**[-short-uptime <integer>] - Short Uptime (secs)**

This optionally specifies the time period used by the **-onshort-uptime** parameter. The default setting is 60 seconds. This parameter is available only at the advanced privilege level and higher.

**[-attempts <integer>] - Number of Giveback Attempts**

This optionally specifies the number of times the node attempts an automatic giveback operation within 60 minutes; the time period is modifiable by using the **-attempts-time** parameter. The default setting is 2 attempts. This parameter is available only at the advanced privilege level and higher.

**[-attempts-time <integer>] - Giveback Attempts Period (minutes)**

This optionally specifies the time period used by the **-attempts** parameter. The default setting is 60 minutes. This parameter is available only at the advanced privilege level and higher.

**[-propagate {true|false}] - Propagate Status via Mailbox**

This optionally specifies whether storage-failover status is communicated via mailbox disks. The default setting is **true** . This parameter is available only at the advanced privilege level and higher.

**[-read-interval <integer>] - Node Status Read Interval (secs)**

This optionally specifies, in seconds, how frequently the node reads its partner node's status from the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

**[-write-interval <integer>] - Node Status Write Interval (secs)**

This optionally specifies, in seconds, how frequently the node writes its status to the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

**[-onreboot {true|false}] - Takeover on Reboot Enabled**

This optionally specifies whether the node automatically takes over for its partner if the partner reboots. The default setting is **true** . Takeover can occur if the partner exceeds the expected time to reboot even when this option is set to false. The expected time to reboot is different for different platforms. The minimum expected time to reboot is 180 seconds. The **-inhibit-takeover** option of the system node reboot command overrides this option: if a node is rebooted with **-inhibit-takeover** set to **true** then takeover does not occur, even if the **takeover on reboot** option is true. If a node does takeover due to the partner rebooting, then it will automatically giveback

after the reboot, even if the **-auto-giveback** option is set to **false** . This is non-persistent behavior: if the node does takeover due to partner reboot and then itself reboots (prior to giveback) then it will not automatically giveback if the **-auto-giveback** option is set to **false** .

### **[-delay-seconds <integer>] - Delay Before Auto Giveback (secs)**

This optionally specifies the minimum time that a node will stay in takeover state prior to performing an automatic giveback. If the taken over node recovers quickly (for example, if the takeover was due to a reboot), by delaying the giveback for a few minutes the outage during the takeover and giveback can be reduced to two short outages instead of one longer one. The allowed range is 0 to 600, inclusive. The default setting is 600 seconds. This option affects all types of auto-giveback. This parameter is available only at the advanced privilege level and higher.

This delay does not affect manual giveback.

### **[-hwassist {true|false}] - Hardware Assist Enabled**

This optionally specifies whether the hardware assist feature is enabled. If set to **true** this feature helps in fast takeover detection times in certain cases.

### **[-hwassist-partner-ip <IP Address>] - Partner's Hwassist IP**

This optionally specifies the Ip address on which the partner node receives hardware assist alerts. For the hardware assist feature to be active,the value of this option should be equal to partner's node managemant Ip address.

### **[-hwassist-partner-port <integer>] - Partner's Hwassist Port**

This optionally specifies the port number on which partner node listens to hardware assist alerts.It is recommended to have this value to be between 4000-4500. The default value is 4444.

### **[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)**

This optionally specifies,in seconds, how frequently the hardware assist hardware on a node sends a heartbeart to it's partner.The default value is 180.

### **[-hwassist-retry-count <integer>] - Hwassist Retry Count**

This optionally specifies the number of times we repeat sending an hardware assist alert. The default value is 2.

### **[-auto-giveback-after-panic {true|false}] - Auto Giveback After Takeover On Panic**

This optionally specifies whether a node should attempt automatic giveback operations if takeover was because of a disruption in the partner's operation. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation automatically. The default setting is **true** .

This parameter is independent of the **-auto-giveback** parameter. If this parameter is enabled and the takeover is due to disruption in the partner's operation, giveback will be initiated even if **-auto-giveback** parameter is **false** .

**[-aggregate-migration-timeout <integer>] - Aggregate Migration Timeout (secs)**

This optionally specifies the amount of time, in seconds, the source node has to wait for the destination node to complete the aggregate migration before declaring the migration as failed. The default setting is 120 seconds.

## Examples

The following example enables the storage-failover service on a node named node0:

```
node::> storage failover modify -node node0 -enabled true
```

The following examples enable storage-failover takeover on a short uptime of 30 seconds on a node named node0:

```
node::*> storage failover modify -node node0 -onshort-uptime true -short-uptime 30
```

## Related Links

- [system node reboot](#)

# storage failover show-giveback

Display giveback status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage failover show-giveback** command displays information about the giveback status of high-availability (HA) partner aggregates. The command displays the following information when no parameters are specified:

- Node name
- Partner aggregate name
- Giveback Status

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular aggregate, run the command with the ``-aggregate aggregate_name`` parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is used, the command displays information about the giveback status of the aggregates belonging to the HA partner of the specified node.

**[-aggregate <text>] - Aggregate**

If this parameter is used, the command displays information about the giveback status of the specified aggregate.

**[-giveback-status <text>, ...] - Aggregates Giveback State**

If this parameter is used, the command displays information about the aggregates with the specified giveback status.

**[-destination <text>] - Destination for Giveback**

If this parameter is used, the command displays information about the giveback status of the aggregates whose destination after the giveback is the specified node.

## Examples

The following example displays information about giveback status on all nodes:

```
node::> storage failover show-giveback
      Partner
Node   Aggregate      Giveback Status
-----
node0  -                  No aggregates to give back
node1  -                  No aggregates to give back
node2  -                  No aggregates to give back
node3  -                  No aggregates to give back
4 entries were displayed.
```

# storage failover show-takeover

## Display takeover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage failover show-takeover** command displays information about the takeover status of nodes in a cluster. The command also displays the takeover status of aggregates being taken over. During each phase of takeover, the takeover node and the node being taken over display their takeover status and the status of the aggregates being taken over. The command displays the following information when no parameters are specified:

- Node name
- Node takeover status - This contains a descriptive information about the phase of takeover.
- Aggregate
- Aggregate takeover status - This contains the following information:
  - Takeover status of the aggregate, such as "Done", "Failed", "In progress" and "Not attempted yet".
  - Reason for an aggregate takeover failure.
  - Corrective action, in case of an aggregate takeover failure.

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular node, run the command with the ``-node`'_node_name_'`` parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If this parameter is specified, the command displays the specified fields for all nodes, in column style output.

**{ [-instance ] }**

If this parameter is specified, the command displays the same detailed information as for the `-node` parameter, but for all nodes.

**[-node {<nodename>|local}] - Node Name**

If this parameter is specified, the command displays information about the takeover status of the specified node, and the takeover status of the aggregates being taken over.

**[-node-takeover-status <text>] - Node's Takeover Status**

If this parameter is specified, the command displays information about the takeover status of the nodes with the specified `node-takeover-status`. The command also displays the takeover status of

the aggregates belonging to the node being taken over.

### **[-aggregate <text>] - Aggregate Being Taken Over**

If this parameter is specified, the command displays information about the takeover status of the specified aggregate, and the takeover status of the nodes containing the specified aggregate.

### **[-aggregate-takeover-status <text>] - Aggregate's Takeover Status**

If this parameter is specified, the command displays information about the takeover status of the aggregates with the specified aggregate takeover status, and the takeover status of the nodes containing those aggregates.

## Examples

The following example shows the takeover status of two nodes, nodeA and nodeB, in an High Availability (HA) pair, when both are in normal mode; neither node has taken over its HA partner. In this case, there is no takeover status for the aggregates.

```
cluster1::> storage failover show-takeover
Node      Node Status      Aggregate      Takeover Status
-----
nodeA     Takeover not
          attempted.
          -
nodeB     Takeover not
          attempted.
          -
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA is in the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
Node      Node Status      Aggregate      Takeover Status
-----
nodeA     Optimized takeover
          of partner in
          progress. Partner,
          ("nodeB"), is
          relocating its SFO
          aggregates. Run the
          command "storage
          failover
          show-takeover -node
          nodeB" to display the
          relocation status of
          the partner.
          -
nodeB     Being taken over.
```

```

aggr1      In progress, Module: backup.
aggr2      Not attempted yet
CFO aggregates Not attempted yet.

```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO phase of an optimized takeover of nodeB (but has not completed the CFO phase of the optimized takeover). In this case, nodeA has information about the takeover status of nodeB's aggregates.

```

cluster1::> storage failover show-takeover
ode      Node Status          Aggregate      Takeover Status
-----
odeA     Partner has
         relocated its
         aggregates. Takeover
         in progress.
         aggr1      Done
         aggr2      Done
         CFO aggregates In progress.
odeB     Relocated aggregates
         to partner. Waiting
         for partner to
         takeover.
         aggr1      Done
         aggr2      Done
         CFO aggregates Not attempted yet.

```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO and CFO phases of an optimized takeover of nodeB. In this case, nodeA has information about the takeover status of nodeB's aggregates. Since nodeB is not operational, an Remote Procedure Call(RPC) error is indicated in the command output.

```

cluster1::> storage failover show-takeover
ode      Node Status          Aggregate      Takeover Status
-----
odeA     Partner has
         relocated its
         aggregates. In
         takeover.
         aggr1      Done
         aggr2      Done
         CFO aggregates Done.
arning: Unable to list entries on node nodeB. RPC: Port mapper failure - RPC:
         Timed out

```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has aborted the SFO phase of an optimized takeover of nodeB. In this case, nodeA does

not have information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
ode      Node Status      Aggregate      Takeover Status
-----
odeA     Optimized takeover
         of partner aborted.
         Run the command
         "storage failover
         show-takeover -node
         nodeB" to display the
         relocation status of
         the partner.
         -
odeB     Optimized takeover
         by partner aborted.
         aggr1      Failed: Destination node did
                   not online the aggregate on
                   time. To takeover the
                   remaining aggregates, run the
                   "storage failover takeover
                   -ofnode nodeB
                   -bypass-optimization true"
                   command. To giveback the
                   relocated aggregates, run the
                   "storage failover giveback
                   -ofnode nodeB" command.
         aggr2      Not attempted yet
         CFO aggregates Not attempted yet.
```

## storage failover show

Display storage failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage failover show** command displays information about storage-failover configurations. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether storage failover is possible.
- The current state of storage failover. If the takeover is disabled the appropriate reason would be displayed.

To display detailed information about storage failover on a specific node, run the command with the `-node` parameter. The detailed view adds the following information:

- Node NVRAM ID.
- Partner NVRAM ID.
- Whether storage failover is enabled.
- Whether the storage-failover interconnect is available.
- Status of individual storage-failover interconnect links.
- Type and vendor of the storage-failover interconnect.
- Partner State
- Status codes from the takeover-by-partner process. Possible values include:
  - NVRAM\_DOWN
  - OPERATOR\_DISABLE\_NVRAM
  - PARTNER\_RESET
  - FM\_TAKEOVER
  - NVRAM\_MISMATCH
  - OPERATOR\_DENY
  - CLUSTER\_DISABLE
  - VERSION
  - SHELF\_HOT
  - REVERT\_IN\_PROGRESS
  - HALT\_NOTKOVER
  - TAKEOVER\_ON\_PANIC
- Reasons why takeover is not possible, if applicable. Possible values include:
  - NOT\_INIT
  - DISABLED
  - DEGRADED
  - MBX\_UNKNOWN
  - FM\_VERSION
  - PARTNER\_DISABLED
  - OPERATOR\_DENY
  - NVRAM\_MISMATCH
  - VERSION
  - IC\_ERROR
  - BOOTING

- SHELF\_HOT
- PARTNER\_REVERT\_IN\_PROGRESS
- LOCAL\_REVERT\_IN\_PROGRESS
- PARTNER\_TAKEOVER
- LOCAL\_TAKEOVER
- HALT\_NOTKOVER
- LOG\_UNSYNC
- UNKNOWN
- WAITING\_FOR\_PARTNER
- LOW\_MEMORY
- HALTING
- MBX\_UNCERTAIN
- NO\_AUTO\_TKOVER
- Time until takeover, in seconds.
- Time until auto giveback, in seconds.
- Delay for auto giveback, in seconds.
- List of local mailbox disks.
- List of partner mailbox disks.
- Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover.

You can specify additional parameters to select the displayed information. For example, to display information only about storage-failover configurations whose interconnect is down, run the command with `-interconnect-up false`.

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -options ]**

Displays the following information:

- Node name
- Whether automatic giveback operations are enabled
- Whether long-running operations are terminated when an automatic giveback operation is initiated
- Whether the node checks its partner's readiness before initiating a giveback operation

- The time, in seconds, that the node remains unresponsive before its partner initiates a takeover operation
- Whether the node automatically takes over for its partner if the partner fails
- Whether the node automatically takes over for its partner if the partner panics
- Whether the node automatically takes over for its partner if the partner reboots
- whether Hardware Assisted Takeover is enabled
- Ip address on which the partner node listens to the Hardware Assist alerts
- Port number on which the partner node listens to the Hardware Assist alerts
- Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover

If this parameter is specified when the privilege level is set to advanced or higher, the command displays the information in the previous list and the following additional information:

- Whether the node takes over for its partner if its partner fails after a period of time, which is listed in the following field
- The number of seconds before the node takes over for its partner
- The number of times the node attempts an automatic giveback operation within a period of time
- The number of minutes in which the automatic giveback attempts can occur
- Whether storage-failover status is communicated via mailbox disks
- The interval at which the node reads its partner node's status from the mailbox disks
- The interval at which the node writes its status to the mailbox disks
- '
- The interval at which Hardware assist h/w sends a heartbeat
- The number of times the Hardware assist alert is sent

#### **[ [-takeover-status ]**

Displays the following information:

- Node name
- Partner name
- Takeover enabled
- Takeover possible
- Interconnect up
- State
- Node NVRAM ID
- Partner NVRAM ID
- Reason Takeover Not Possible By Partner

- Reason Takeover Not Possible
- Time Until Takeover

**[ -advanced ]**

Displays the following information:

- Node name
- Whether kill messages are issued during a takeover operation
- Whether the node controls its partner's storage aggregates
- The time when firmware notification was received
- The time when booting notification was received
- The time at which the last takeover or giveback operation occurred, in microseconds
- The number of times the failover log was unsynchronized

**[ -iotime ]**

Displays the following information:

- Node name
- Primary normal I/O time
- Primary transition I/O time
- Backup normal I/O time
- Backup transition I/O time

**[ -mailbox-status ]**

Displays the following information:

- Node name
- Primary mailbox status
- Backup mailbox status

**[ -more-options ]**

Displays the following information:

- Node name
- Whether takeover on short uptime is enabled
- Short uptime, in seconds
- Number of giveback attempts
- Interval of giveback attempts, in minutes
- Whether the primary mailbox is online
- Mailbox status read interval, in seconds
- Mailbox status write interval, in seconds

**| [-progress ]**

Displays the following information:

- Node name
- Maximum resource-table index number
- Current resource-table index number
- Current resource-table entry

**| [-timeout ]**

Displays the following information:

- Node name
- Fast timeout
- Slow timeout
- Mailbox timeout
- Connection timeout
- Operator timeout
- Firmware timeout
- Dump-core timeout
- Booting timeout
- Reboot timeout

**| [-transit ]**

Displays the following information:

- Node name
- Transit Timer Enabled
- Transit Timeout

**| [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes whose name matches this parameter value.

**[-partner-name <text>] - Partner Name**

Selects the nodes that have the specified partner-name setting.

**[-nvrמיד <integer>] - Node NVRAM ID**

Selects the nodes that have the specified NVRAM ID setting.

**[-partner-nvrמיד <integer>] - Partner NVRAM ID**

Selects the nodes that have the specified partner NVRAM ID setting.

**[-enabled {true|false}] - Takeover Enabled**

Selects the nodes that have the specified takeover-enabled setting.

**[-mode {ha|non\_ha}] - HA Mode**

Selects the nodes that have the specified HA-mode setting. If the value is set to **ha** then the node is a member of a storage-failover configuration. If it is set to **non-ha** then it is in a stand alone configuration.

**[-possible {true|false}] - Takeover Possible**

Selects the nodes that have the specified failover-possible setting.

**[-reason <text>, ...] - Reason Takeover not Possible**

Selects the nodes that have the specified reason-not-possible setting. Possible values include:

- NOT\_INIT
- DISABLED
- DEGRADED
- MBX\_UNKNOWN
- FM\_VERSION
- PARTNER\_DISABLED
- OPERATOR\_DENY
- NVRAM\_MISMATCH
- VERSION
- IC\_ERROR
- BOOTING
- SHELF\_HOT
- PARTNER\_REVERT\_IN\_PROGRESS
- LOCAL\_REVERT\_IN\_PROGRESS
- PARTNER\_TAKEOVER
- LOCAL\_TAKEOVER
- HALT\_NOTKOVER
- LOG\_UNSYNC
- UNKNOWN
- WAITING\_FOR\_PARTNER
- LOW\_MEMORY
- HALTING
- MBX\_UNCERTAIN
- NO\_AUTO\_TKOVER

**[-interconnect-up {true|false}] - Interconnect Up**

Selects the nodes that have the specified interconnect-up setting.

**[-interconnect-links <text>] - Interconnect Links**

Selects the nodes that have the specified interconnect-links setting.

**[-interconnect-type <text>] - Interconnect Type**

Selects the nodes that have the specified interconnect-type setting.

**[-state-description <text>] - State Description**

Selects the nodes that have the specified state-description setting.

**[-partner-state <text>] - Partner State**

Selects the nodes that have the specified partner-state setting. Possible values include:

- OPERATOR COMPLETED
- DEBUGGUER COMPLETED
- PROGRESS COUNTER
- I/O ERROR
- BAD CHECKSUM
- RESERVED
- UNKNOWN
- INITIALIZING
- IN POWER-ON SELF TEST
- BOOTING
- BOOT FAILED
- WAITING
- KERNEL LOADED
- UP
- IN DEBUGGER
- WAITING FOR OPERATOR INPUT
- DUMPING CORE
- HALTED
- REBOOTING
- WAITING FOR GIVEBACK (DISK RESERVATIONS)
- WAITING FOR GIVEBACK (HA MAILBOXES)
- DUMPING SPARECORE
- MULTI-DISK PANIC
- IN TAKEOVER

**[-time-until-takeover <integer>] - Time Until Takeover**

Selects the nodes that have the specified time-until-takeover setting.

**[-partner-reason <text>,···] - Reason Takeover not Possible by Partner**

Selects the nodes that have the specified partner-reason text setting.

**[-killpackets {true|false}] - Issue Kill Packets**

Selects the nodes that have the specified kill packets setting.

**[-partner-aggregates {true|false}] - Control Partner Aggregates**

Selects the nodes that have the specified partner aggregates setting.

**[-current-index <integer>] - Current Progress Index**

Selects the nodes that have the specified current-progress index setting.

**[-current-entry <text>] - Current Progress Entry**

Selects the nodes that have the specified current-progress entry setting.

**[-maximum-index <integer>] - Maximum Progress Index**

Selects the nodes that have the specified maximum-progress index setting.

**[-pmbox-status <text>,···] - Primary Mailbox Status**

Selects the nodes that have the specified primary mailbox status setting. Possible values include:

- MBX\_STATUS\_NODISKS
- MBX\_STATUS\_UNCERTAIN
- MBX\_STATUS\_STALE
- MBX\_STATUS\_CONFLICTED
- MBX\_STATUS\_OLD\_VERSION
- MBX\_STATUS\_NOT\_FOUND
- MBX\_STATUS\_WRONG\_STATE
- MBX\_STATUS\_BACKUP

**[-bmbx-status <text>,···] - Backup Mailbox Status**

Selects the nodes that have the specified backup-mailbox status setting. See the description of the **-pmbox-status** parameter for a list of possible values.

**[-major-seq-num-local <integer>] - Local Major Sequence Number**

Selects the nodes that have the specified mailbox heartbeat major sequence number on the local node.

**[-minor-seq-num-local <integer>] - Local Minor Sequence Number**

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the local node.

**[-major-seq-num-partner <integer>] - Partner Major Sequence Number**

Selects the nodes that have the specified mailbox heartbeat major sequence number on the partner node.

**[-minor-seq-num-partner <integer>] - Partner Minor Sequence Number**

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the partner node.

**[-local-mbx-node-status <Mailbox Status>] - Local Mailbox Node Status**

Selects the nodes that have the specified local mailbox node status. Possible values include:

- MBX\_UNKNOWN - Local node is up, mailbox uninitialized
- MBX\_TAKEOVER\_DISABLED - Local node is up but takeover is disallowed
- MBX\_TAKEOVER\_ENABLED - Local node is up and takeover is allowed
- MBX\_TAKEOVER\_ACTIVE - Partner node has taken over
- MBX\_GIVEBACK\_DONE - Giveback completed, but local node has not yet restarted

**[-mbx-abs-time-local <integer>] - Local Mailbox Absolute Time**

Selects the nodes that have the specified local mailbox channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-mbx-sk-time-local <integer>] - Local Mailbox Kernel Time**

Selects the nodes that have the specified local mailbox channel Kernel Time.

**[-mbx-sk-cycles-local <integer>] - Local Mailbox CPU Cycles**

Selects the nodes that have the specified local mailbox channel CPU Cycle count.

**[-ic-abs-time-local <integer>] - Local IC Absolute Time**

Selects the nodes that have the specified local Interconnect channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-ic-sk-time-local <integer>] - Local IC Kernel Time**

Selects the nodes that have the specified local Interconnect channel Kernel Time.

**[-ic-sk-cycles-local <integer>] - Local IC CPU Cycles**

Selects the nodes that have the specified local Interconnect channel CPU Cycle count.

**[-partner-mbx-node-status <Mailbox Status>] - Partner Mailbox Node Status**

Selects the nodes that have the specified partner mailbox node status. Possible values include:

- MBX\_UNKNOWN
- MBX\_TAKEOVER\_DISABLED
- MBX\_TAKEOVER\_ENABLED
- MBX\_TAKEOVER\_ACTIVE
- MBX\_GIVEBACK\_DONE

**[-mbx-abs-time-partner <integer>] - Partner Mailbox Absolute Time**

Selects the nodes that have the specified partner mailbox channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-mbx-sk-time-partner <integer>] - Partner Mailbox Kernel Time**

Selects the nodes that have the specified partner mailbox channel Kernel Time.

**[-mbx-sk-cycles-partner <integer>] - Partner Mailbox CPU Cycles**

Selects the nodes that have the specified partner mailbox channel CPU Cycle count.

**[-mbx-major-seq-num-partner <integer>] - Partner Mailbox Major Sequence Number**

Selects the nodes that have the specified partner mailbox channel major sequence number.

**[-mbx-minor-seq-num-partner <integer>] - Partner Mailbox Minor Sequence Number**

Selects the nodes that have the specified partner mailbox channel minor sequence number.

**[-ic-abs-time-partner <integer>] - Partner IC Absolute Time**

Selects the nodes that have the specified partner Interconnect channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-ic-sk-time-partner <integer>] - Partner IC Kernel Time**

Selects the nodes that have the specified partner Interconnect channel Kernel Time.

**[-ic-sk-cycles-partner <integer>] - Partner IC CPU Cycles**

Selects the nodes that have the specified partner Interconnect channel CPU Cycle count.

**[-ic-major-seq-num-partner <integer>] - Partner IC Major Sequence Number**

Selects the nodes that have the specified partner Interconnect channel major sequence number.

**[-ic-minor-seq-num-partner <integer>] - Partner IC Minor Sequence Number**

Selects the nodes that have the specified partner Interconnect channel minor sequence number.

**[-local-takeover-info <text>] - Local Takeover Info**

Selects the nodes that have the specified local node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:

- NOTKOVER\_NVRAM\_DOWN - NVRAM mirror is down
- NOTKOVER\_OPERATOR\_DISABLE\_NVRAM - Operator disabled
- NOTKOVER\_PARTNER\_RESET - A link reset is in progress
- NOTKOVER\_FM\_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER\_NVRAM\_MISMATCH - NVRAM sizes mismatch
- NOTKOVER\_OPERATOR\_DENY - Operator denies takeover
- NOTKOVER\_CLUSTER\_DISABLE - Cluster is disabled
- NOTKOVER\_VERSION - Version mismatch

- NOTKOVER\_SHELF\_HOT - Disk shelf is too hot
- NOTKOVER\_REVERT\_IN\_PROGRESS - Revert is in progress
- NOTKOVER\_HALT\_NOTKOVER - Node halted in no-takeover mode
- TKOVER\_ON\_REBOOT - Enable takeover on reboot
- TKOVER\_ON\_PANIC - Enabled takeover on panic
- TKOVER\_ON\_STUTTER\_DISABLED - Disable takeover on short uptime
- NFO\_DISK\_SHELF\_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO\_ISCSI\_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO\_FCP\_TARGET\_ENABLED - Negotiated failover for fcp target module is enabled

#### **[-partner-takeover-info <text>] - Partner Takeover Info**

Selects the nodes that have the specified partner node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:

- NOTKOVER\_NVRAM\_DOWN - NVRAM mirror is down
- NOTKOVER\_OPERATOR\_DISABLE\_NVRAM - Operator disabled
- NOTKOVER\_PARTNER\_RESET - A link reset is in progress
- NOTKOVER\_FM\_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER\_NVRAM\_MISMATCH - NVRAM sizes mismatch
- NOTKOVER\_OPERATOR\_DENY - Operator denies takeover
- NOTKOVER\_CLUSTER\_DISABLE - Cluster is disabled
- NOTKOVER\_VERSION - Version mismatch
- NOTKOVER\_SHELF\_HOT - Disk shelf is too hot
- NOTKOVER\_REVERT\_IN\_PROGRESS - Revert is in progress
- NOTKOVER\_HALT\_NOTKOVER - Node halted in no-takeover mode
- TKOVER\_ON\_REBOOT - Takeover on reboot is enabled
- TKOVER\_ON\_PANIC - Takeover on panic is enabled
- TKOVER\_ON\_STUTTER\_DISABLED - Disable takeover on short uptime
- NFO\_DISK\_SHELF\_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO\_ISCSI\_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO\_FCP\_TARGET\_ENABLED - Negotiated failover for fcp target module is enabled

#### **[-local-headswap-state <Headswap State>] - Local Head Swap State**

Selects the nodes that have the specified local node headswap state. Possible values are:

- HEADSWAP\_NONE - head swap not in progress
- HEADSWAP\_START - head swap started
- HEADSWAP\_CFO\_START - CFO phase of head swap started

- HEADSWAP\_CFO\_END - CFO phase of head swap completed
- HEADSWAP\_SFO\_START - SFO phase of head swap started

**[-partner-headswap-state <Headswap State>] - Partner Head Swap State**

Selects the nodes that have the specified partner node headswap state. Possible values are:

- HEADSWAP\_NONE - head swap not in progress
- HEADSWAP\_START - head swap started
- HEADSWAP\_CFO\_START - CFO phase of head swap started
- HEADSWAP\_CFO\_END - CFO phase of head swap completed
- HEADSWAP\_SFO\_START - SFO phase of head swap started

**[-fast-timeout <integer>] - Fast Timeout**

Selects the nodes that have the specified fast-timeout configuration setting.

**[-slow-timeout <integer>] - Slow Timeout**

Selects the nodes that have the specified slow-timeout setting.

**[-mailbox-timeout <integer>] - Mailbox Timeout**

Selects the nodes that have the specified mailbox-timeout setting.

**[-connect-timeout <integer>] - Connect Timeout**

Selects the nodes that have the specified connect-timeout setting.

**[-operator-timeout <integer>] - Operator Timeout**

Selects the nodes that have the specified operator-timeout setting.

**[-firmware-timeout <integer>] - Firmware Timeout**

Selects the nodes that have the specified firmware-timeout setting.

**[-dumpcore-timeout <integer>] - Dumpcore Timeout**

Selects the nodes that have the specified dump-core timeout setting.

**[-booting-timeout <integer>] - Booting Timeout**

Selects the nodes that have the specified booting-timeout setting.

**[-transit-timer {true|false}] - Transit Timer Enabled**

Selects the nodes that have the specified transit-timer setting.

**[-transit-timeout <integer>] - Transit Timeout**

Selects the nodes that have the specified transit timeout.

**[-firmware-received <integer>] - Firmware Received**

Selects the nodes that have the specified firmware-reception time.

**[-firmware-received-cycles <integer>] - Firmware Received in CPU Cycles**

Selects the nodes that have the specified firmware-reception time in CPU Cycles.

**[-booting-received <integer>] - Booting Received**

Selects the nodes that have the specified booting-reception time.

**[-transit-time <integer>] - Transit Event Time**

Selects the nodes whose last failover event occurred at the specified time.

**[-pnormal <integer>] - Primary Normal IO Time**

Selects the nodes that have the specified normal primary-mailbox I/O time.

**[-ptransition <integer>] - Primary Transition IO Time**

Selects the nodes that have the specified transitional primary-mailbox I/O time.

**[-bnormal <integer>] - Backup Normal IO Time**

Selects the nodes that have the specified normal backup-mailbox I/O time.

**[-btransition <integer>] - Backup Transition IO Time**

Selects the nodes that have the specified transitional backup-mailbox I/O time.

**[-logs-unsynced <integer>] - Logs Unsynced Count**

Selects the nodes that have the specified count of unsynchronized logs.

**[-auto-giveback {true|false}] - Auto Giveback Enabled**

Selects the nodes that have the specified auto-giveback setting.

**[-detection-time <integer>] - Takeover Detection Time (secs)**

Selects the nodes that have the specified detection-time setting.

**[-onfailure {true|false}] - Takeover on Failure Enabled**

Selects the nodes that have the specified takeover-on-failure setting.

**[-onpanic {true|false}] - Takeover on Panic Enabled**

Selects the nodes that have the specified takeover-on-panic setting.

**[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled**

Selects the storage-failover configurations that match this parameter value.

**[-short-uptime <integer>] - Short Uptime (secs)**

Selects the nodes that have the specified short-uptime value.

**[-attempts <integer>] - Number of Giveback Attempts**

Selects the nodes that have the specified number of giveback attempts.

**[-attempts-time <integer>] - Giveback Attempts Period (minutes)**

Selects the nodes that have the specified time setting for giveback attempts.

**[-propagate {true|false}] - Propagate Status via Mailbox**

Selects the nodes that have the specified propagate-status-via-mailbox setting.

**[-read-interval <integer>] - Node Status Read Interval (secs)**

Selects the nodes that have the specified read interval.

**[-write-interval <integer>] - Node Status Write Interval (secs)**

Selects the nodes that have the specified write interval.

**[-onreboot {true|false}] - Takeover on Reboot Enabled**

Selects the nodes that have the specified takeover-on-reboot setting.

**[-delay-seconds <integer>] - Delay Before Auto Giveback (secs)**

Selects the nodes that have the specified delay (in seconds) for the auto giveback.

**[-hwassist {true|false}] - Hardware Assist Enabled**

Selects the nodes that have the specified hwassist setting.

**[-hwassist-partner-ip <IP Address>] - Partner's Hwassist IP**

Selects the nodes that have the specified hwassist-partner-ip setting.

**[-hwassist-partner-port <integer>] - Partner's Hwassist Port**

Selects the nodes that have the specified hwassist-partner-port setting.

**[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)**

Selects the nodes that have the specified hwassist health check interval, in seconds.

**[-hwassist-retry-count <integer>] - Hwassist Retry Count**

Selects the nodes that have the specified hwassist retry count, in seconds.

**[-hwassist-status <text>] - Hwassist Status**

Selects the nodes that have the specified hwassist-status setting.

**[-time-until-autogiveback <integer>] - Time Until Auto Giveback (secs)**

Selects the nodes that have the specified time(in seconds) until auto giveback.

**[-local-mailbox-disks <text>] - Local Mailbox Disks**

Selects the nodes that have the specified mailbox disks on the local node.

**[-partner-mailbox-disks <text>] - Partner Mailbox Disks**

Selects the nodes that have the specified mailbox disks on the partner node.

**[-local-firmware-state <text>] - Local Firmware State**

Selects the nodes that have the specified firmware state on the local node.

**[-local-firmware-progress <integer>] - Local Firmware Progress Counter**

Selects the nodes that have the specified firmware progress counter for the local node.

**[-partner-firmware-state <text>] - Partner Firmware State**

Selects the nodes that have the specified firmware state of the partner node.

**[-partner-firmware-progress <integer>] - Partner Firmware Progress Counter**

Selects the nodes that have the specified firmware progress counter for the partner node.

**[-local-missing-disks <text>] - Missing Disks on Local Node**

Selects the nodes that have the specified missing disks on the local node.

**[-partner-missing-disks <text>] - Missing Disks on Partner Node**

Selects the nodes that have the specified missing disks on the partner node.

**[-reboot-timeout <integer>] - Reboot Timeout**

Selects the nodes that have the specified reboot timeout.

**[-time-since-takeover <text>] - Time Since Takeover**

Selects the nodes that have been in takeover mode for the specified amount of time.

**[-auto-giveback-after-panic {true|false}] - Auto Giveback After Takeover On Panic**

Selects the nodes that have the specified auto-giveback-after-panic setting. If **true** then an automatic giveback operation is invoked when the failover node of an HA pair is repaired and rebooted. The takeover node of the HA pair detects this and initiates a giveback operation automatically.

**[-is-giveback-requested {true|false}] - Giveback Requested**

Selects the nodes that have the specified is-giveback-requested setting. If **true**, a deferred giveback request has been made by the local node.

**[-auto-giveback-last-veto-check <integer>] - Auto Giveback Last Veto Check**

Selects the nodes that have the specified auto-giveback-last-veto-check time. This setting indicates the time, in milliseconds, when the local node made the most recent giveback veto check.

**[-is-auto-giveback-attempts-exceeded {true|false}] - Auto Giveback Attempts Exceeded**

Selects the nodes that have the specified is-auto-giveback-attempts-exceeded setting. If **true**, the local node has exceeded the maximum number of allowed auto giveback attempts.

**[-was-auto-giveback-done {true|false}] - Was Auto Giveback Done**

Selects the nodes that have the specified was-auto-giveback-done setting. If **true**, the last giveback was automatic (as opposed to a manual giveback).

**[-is-cifs-auto-giveback-stopping {true|false}] - Is CIFS Auto Giveback Stopping**

Selects the nodes that have the specified is-cifs-auto-giveback-stopping setting. If **true**, the local node has initiated CIFS termination as part of an automatic giveback.

**[-aggregate-migration-timeout <integer>] - Aggregate Migration Timeout (secs)**

Selects the nodes that have the specified aggregate migration timeout.

**[-is-mirror-enabled {true|false}] - Is NVRAM Mirroring Enabled**

Selects the nodes that have the specified is-mirror-enabled setting. If **true**, then NVRAM

mirroring is enabled.

### **[-is-mirror-consistency-required {true|false}] - Is Mirror Consistency Required**

Selects the nodes that have the specified is-mirror-consistency-required setting. If **true**, then NVRAM mirror consistency is required.

### **[-is-memory-insufficient {true|false}] - Is Memory Insufficient To Takeover**

Selects the nodes that have the specified is-memory-insufficient setting. If **true**, the local node does not have enough memory to perform a takeover.

### **[-memio-state <memio status>] - Current State of Memio Link**

Selects the nodes that have the specified memio layer link current state. Possible values are:

- UNINIT - Uninitialized
- CLOSED - Closed
- HB\_LISTEN - Listening for connect
- SYN\_SENT - Sent generation information
- ESTABLISHED - Connection established

### **[-is-degraded {true|false}] - Are Partner Mailbox Disks Not Known**

Selects the nodes that have the specified is-degraded setting. If **true**, takeovers are deferred because partner mailbox disks are not known.

### **[-reserve-policy <reserve policy>] - FM Reservation Policy**

Selects the nodes that have the specified disk reservation policy. Possible values are:

- RESERVE\_NO\_DISKS - no disk reservations made during takeover, nor are disk reservations released during giveback
- RESERVE\_LOCK\_DISKS\_ONLY - only mailbox disks are released during takeover and released during giveback
- RESERVE\_ONLY\_AT\_TAKEOVER - reservations are issued only at takeover time. All disks are reserved. All reservations are released at giveback
- RESERVE\_ALWAYS\_AFTER\_TAKEOVER - reservations are issued at takeover. When disks are subsequently added, they are also reserved. All disks are released at giveback

### **[-reset-disks {true|false}] - Issue Disk Resets during Failover**

Selects the nodes that have the specified reset-disks setting. If **true**, disks are reset during takeover/giveback.

### **[-total-system-uptime <integer>] - Total System Uptime**

Selects the nodes that have the specified total system uptime, in milliseconds.

### **[-current-time <integer>] - Current System Time**

Selects the nodes that have the specified current time on the node.

**[-fm-takeover-state <FM Takeover/Giveback Transition>] - FM Takeover State**

Selects the nodes that have the specified takeover state. Possible values are:

- FT\_NONE - Not in takeover
- FT\_TAKEOVER\_STARTED - Local node has initiated takeover
- FT\_TAKEOVER\_COMMITTED - Takeover has been committed
- FT\_TAKEOVER\_DONE\_OK - Local node successfully completed takeover
- FT\_TAKEOVER\_DONE\_FAILED - Takeover failed

**[-fm-giveback-state <FM Takeover/Giveback Transition>] - FM Giveback State**

Selects the nodes that have the specified giveback state. Possible values are:

- FT\_NONE - Not in giveback
- FT\_GIVEBACK\_READY - Partner node is ready for giveback
- FT\_GIVEBACK\_STARTED - Local node has initiated giveback
- FT\_GIVEBACK\_COMMITTED - Giveback has been committed
- FT\_GIVEBACK\_DONE\_OK - Giveback completed successfully

**[-takeover-reason <FM Takeover Reason>] - Reason why takeover triggered**

Selects the nodes that have the specified takeover reason. Possible values are:

- TAKEOVER\_NONE - Not in takeover
- TAKEOVER\_IMMEDIATE - Operator initiated forced takeover
- TAKEOVER\_NDU - Takeover initiated as part of NDU
- TAKEOVER\_FORCED - Operator initiated forced takeover, possible data loss
- TAKEOVER\_EARLY - Takeover occurred during the boot process
- TAKEOVER\_OPERATOR\_EXP - Takeover occurred after the operator timeout expired
- TAKEOVER\_POST\_FAILED - Takeover occurred on POST failure
- TAKEOVER\_PANIC - Takeover on panic
- TAKEOVER\_SHORTUPTIME - Takeover after rapid toggling between up and down states
- TAKEOVER\_SPARECORE\_EXP - Takeover on panic timeout expiration
- TAKEOVER\_REBOOT\_EXP - Takeover on reboot timer expiration
- TAKEOVER\_BOOTING\_EXP - Takeover on booting timer expiration
- TAKEOVER\_FIRMWARE\_EXP - Takeover on firmware timer expiration
- TAKEOVER\_NFO\_SHUTDOWN - Takeover on negotiated failover shutdown
- TAKEOVER\_NFO\_TIMER - Takeover on negotiated failover timer expiration
- TAKEOVER\_MDP - Takeover on multi-disk panic
- TAKEOVER\_REBOOT - Takeover on reboot
- TAKEOVER\_HALT - Takeover on halt

- TAKEOVER\_CLAM - CLAM-triggered takeover
- TAKEOVER\_HWASSIST - Hardware-assisted takeover
- TAKEOVER\_NORMAL - Operator initiated takeover

### **[-ha-type {none|shared\_storage|non\_shared\_storage}] - HA Type**

If this parameter is specified, the command selects the nodes that have the specified HA-type setting. If the value is set to **shared\_storage**, then the node is in a storage-failover configuration using the shared storage. If it is set to **non\_shared\_storage**, then the node is in a storage-failover configuration using the unshared storage. If it is set to **none**, then the node is not part of a storage-failover configuration.

## Examples

The following example displays information about all storage-failover configurations:

```
cluster1::> storage failover show
                Takeover
Node    Partner  Possible State
-----
node0   node1     true          Connected to node1
node2   node3     true          Connected to node3
node1   node0     true          Connected to node0
node3   node2     true          Connected to node2
4 entries were displayed.
```

## storage failover takeover

Take over the storage of a node's partner

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage failover takeover** command initiates a takeover of the partner node's storage.

### Parameters

#### **{ -ofnode {<nodename>|local} - Node to Takeover**

This specifies the node that is taken over. It is shut down and its partner takes over its storage.

#### **| -bynode {<nodename>|local} - Node Initiating Takeover }**

This specifies the node that is to take over its partner's storage.

#### **[-option <takeover option>] - Takeover Option**

This optionally specifies the style of takeover operation. Possible values include the following:

- **normal** - Specifies a normal takeover operation; that is, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. This is the default value.
- **immediate** - Specifies an immediate takeover. In an immediate takeover, the takeover operation is initiated before the partner is given the time to close its storage resources gracefully. The use of this option results in an immediate takeover which does not do a clean shutdown. In case of NDU this can result in a NDU failure.

If this option is specified, negotiated takeover optimization is bypassed even if the **-bypass-optimization** option is set to false.

If this option is specified, migration of data LIFs from the partner will be delayed even if the **-skip-lif-migration-before-takeover** option is not specified. If possible, migrate the data LIFs to another node prior to specifying this option.

- **allow-version-mismatch** - If this value is specified, the takeover operation is initiated even if the partner is running a version of software that is incompatible with the version running on the node. In this case, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. However, the takeover operation will not be allowed if the partner has higher WAFL or RAID label versions. Use this value as part of a nondisruptive upgrade or downgrade procedure.
- **force** - If this value is specified, the takeover operation is initiated even if the node detects an error that normally prevents a takeover operation from occurring. This value is available only at the advanced privilege level and higher.

If this option is specified, negotiated takeover optimization is bypassed even if the **-bypass-optimization** option is set to false.

The use of this option can potentially result in data loss. If the HA interconnect is detached or inactive, or the contents of the failover partner's NVRAM cards are unsynchronized, takeover is normally disabled. Using the **-force** option enables a node to take over its partner's storage despite the unsynchronized NVRAM, which can contain client data that can be lost upon storage takeover.

### **[-bypass-optimization {true|false}] - Bypass Takeover Optimization**

If this is an operator-initiated planned takeover, this parameter specifies whether the takeover optimization is bypassed. This parameter defaults to false.

This parameter is ignored and negotiated takeover optimization automatically bypassed if the **-immediate** option, the **-force** option, or the **-allow-disk-inventory-mismatch** parameter is specified as part of the same **storage failover takeover** command.

### **[-allow-disk-inventory-mismatch {true|false}] - Disk inventory**

If this parameter is specified, the takeover operation is initiated even if the local node cannot see the partner's filesystem disks.

If this parameter is specified, negotiated takeover optimization is bypassed even if the **-bypass-optimization** parameter is set to false.

The use of this parameter can potentially result in client outage.

### **[-skip-lif-migration-before-takeover <true>] - Skip Migrating LIFs Away from Node Prior to Takeover**

This parameter specifies that LIF migration prior to takeover is skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the takeover has occurred. Without this parameter, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to its takeover. If the migration fails or times out, the takeover is aborted.

### **[-ignore-quorum-warnings <true>] - Skip Quorum Check Before Takeover**

If this parameter is specified, quorum checks will be skipped prior to the takeover. The operation will continue even if there is a possible data outage due to a quorum issue.

### **[-override-vetoes <true>] - Override Vetoes**

If this is an operator-initiated planned takeover, this parameter specifies whether the veto should be overridden. If this parameter is not specified, its value is set to **false**.

If this parameter is specified, negotiated takeover will override any vetoes to continue with takeover.

The use of this parameter might result in the takeover proceeding even if the node detects issues that can potentially make the takeover dangerous or disruptive.

### **[-halt <true>] - Halt the Node That Is Taken Over**

This parameter specifies whether the node being taken over should be halted. If the value is true, then the node being taken over is halted. If the value is false, then the node being taken over is shutdown and might be rebooted if AUTOBOOT is set to true. This parameter defaults to false.

## Examples

The following example causes a node named node0 to initiate a negotiated optimized takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0
```

The following example causes a node named node0 to initiate an immediate takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0 -option immediate
```

## storage failover hwassist show

Display hardware-assisted storage failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage failover hwassist show** command displays information about the hardware-assisted storage failover status on each node. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether hardware-assisted failover is enabled.
- IP address on which the local node receives hardware-assisted failover alerts.
- Port on which the local node receives hardware-assisted failover alerts.
- Hardware-assisted failover status.
- If the monitor is inactive, the reason it is inactive.
- If the monitor is inactive, the corrective action to make it active.
- Status of keep-alive alerts on the local node.

Hardware-assisted failover establishes a notification channel from each respective node's service processor to the other (HA partner) node. If a node becomes unresponsive, its service processor notifies the HA partner of this condition, accelerating storage failover. By default, hwassist is enabled and configured automatically to use each node's node-mgmt LIF. To modify or show the hardware-assisted storage failover configuration, use the [storage failover modify](#) and [storage failover show](#) commands.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about hwassist on the specified nodes.

**[-partner-name {<nodename>|local}] - Name of the Partner Node**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified partner node.

**[-enabled {true|false}] - Local Hardware Assist Enabled**

If you specify this parameter, the command displays information only about hwassist on nodes

with the specified enabled state.

### **[-local-status <text>] - Local Node's Hwassist Status**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local status (**active** or **inactive**).

### **[-local-ip <text>] - IP Address on Which Local Node is Listening**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local IP address.

### **[-local-port <integer>] - Port on Which Local Node is Listening**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local UDP port.

### **[-local-inactive <text>] - Local Node's Hwassist Inactive Status Reason**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified inactive reason.

### **[-local-action <text>] - Corrective Action on Local Node**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified corrective action.

## Examples

The following example displays the hardware-assisted failover information for node cluster1-01 and its HA partner node cluster1-02:

```
cluster1::> storage failover hwassist show
Node
-----
cluster1-01
                Partner: cluster1-02
Hwassist Enabled: true
                Hwassist IP: 10.225.248.19
                Hwassist Port: 4444
                Monitor Status: active
                Inactive Reason: -
                Corrective Action: -
                Keep-Alive Status: healthy

cluster1-02
                Partner: cluster1-01
Hwassist Enabled: true
                Hwassist IP: 10.225.248.21
                Hwassist Port: 4444
                Monitor Status: active
                Inactive Reason: -
                Corrective Action: -
                Keep-Alive Status: healthy
```

## Related Links

- [storage failover modify](#)
- [storage failover show](#)

# storage failover hwassist test

Test the hwassist functionality

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The ``storage failover hwassist test`` command tests the Hardware Assist h/w connectivity between the two nodes in a HA pair. The test result can be one of the following.

- Hardware Assist is not initialized.
- HW assist is not supported.
- Partner is throttling alerts.
- Resource is busy.
- Hardware Assist h/w returned an error.
- No response from partner.Timed out.
- Unexpected abort.
- Partner has taken over.
- Interconnect is down between nodes.
- Partner is not booted up yet.

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node from which a test alert is initiated.

## Examples

The following command issues a test alert from the node cluster1-01:

```
cluster1::> storage failover hwassist test -node cluster1-01
Info: Operation successful.
```

# storage failover hwassist stats clear

Clear the hwassist statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist stats clear` command clears the statistics information maintained by Hardware Assist functionality.

## Parameters

`-node {<nodename>|local}` - Node

This specifies the node on which the statistics are to be cleared.

## Examples

The following example clears the hwassist statistics on the node cluster1-01:

```
cluster1::> storage failover hwassist stats clear -node cluster1-01
```

# storage failover hwassist stats show

Display hwassist statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist stats show` command displays statistics about the hardware assist alerts processed by a node. The command displays the following information for each alert:

- Locally enabled.
- Partner Inactive Reason.
- Alert type.
- Event that triggered the alert.
- The number of times the alert has been received.
- Whether takeover was possible on receiving the alert.
- The last time at which the alert was received.

## Parameters

{[-fields <fieldname>,...]}

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

![-instance ]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the hwassist statistics for the specified node.

## Examples

The following example displays the hwassist statistics for the node ha1:

```
cluster1::> storage failover hwassist stats show -node ha1
Node: ha1
      Local Enabled: true
Partner Inactive Reason: -
Alert Type  Alert Event                Count Takeover  Last Received
-----
system_down power_loss                       0 Yes          ---
system_down l2_watchdog_reset             0 Yes          ---
system_down power_off_via_rlm       0 Yes          ---
system_down power_cycle_via_rlm    0 Yes          ---
system_down reset_via_rlm           0 Yes          ---
system_down power_off_via_sp        0 Yes          ---
system_down power_cycle_via_sp      0 Yes          ---
system_down reset_via_sp             0 Yes          ---
system_down dimm_uecc_error          0 Yes          ---
system_down post_error               0 No           ---
system_down abnormal_reboot          0 No           ---
system_down loss_of_heartbeat        0 No           ---
keep_alive  periodic_message                 10 No           Wed Mar  9 13:41:28 EST 2016
test        test                          0 No           ---
ID_mismatch ---                          0 ---         ---
Key_mismatch ---                          0 ---         ---
Unknown     ---                          0 ---         ---
            alerts_throttled         0 ---         ---
```

The following example displays the hwassist statistics for the node ha1 where hardware assist hardware is not supported.

```
cluster1::> storage failover hwassist stats show -node ha1
Node: ha1
```

```
Local Enabled: false
```

```
Partner Inactive Reason: HW assist is not supported on partner.
```

```
Alert Type   Alert Event           Count Takeover Last Received
```

```
-----
```

```
-
```

## storage failover internal-options show

Display the internal options for storage failover

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **storage failover internal-options show** command displays the following information about the storage failover configuration:

- Node name
- Whether automatic giveback is enabled
- Whether partner checking is enabled
- Takeover detection time, in seconds
- Whether takeover on failover is enabled
- Whether takeover on panic is enabled
- Whether takeover on reboot is enabled
- Whether hardware-assisted takeover is enabled
- IP address on which the partner node listens to the hardware-assisted takeover alerts
- Port on which the partner node listens to the hardware-assisted takeover alerts
- Whether takeover on short uptime is enabled (detailed view only)
- Short uptime interval, in seconds (detailed view only)
- Number of giveback attempts (detailed view only)
- Giveback attempt interval, in minutes (detailed view only)
- Whether status is propagated through SFO mailboxes (detailed view only)
- Status read interval, in seconds (detailed view only)
- Status write interval, in seconds (detailed view only)
- Hardware-assisted takeover retry count (detailed view only)
- Hardware-assisted takeover heartbeat period (detailed view only)
- Whether operator-initiated planned takeover is optimized

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -more ]**

This parameter displays the following additional information: :

- Node name
- Whether takeover on short uptime is enabled
- Short uptime interval, in seconds
- Number of giveback attempts
- Giveback attempt interval, in minutes
- Whether status is propagated through SFO mailboxes
- Status read interval, in seconds
- Status write interval, in seconds
- Hardware-assisted takeover retry count
- Hardware-assisted takeover heartbeat period

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node**

Selects configuration information for the specified node.

**[ -auto-giveback {true|false} ] - Auto Giveback Enabled**

Selects configuration information for nodes that have the specified automatic giveback setting.

**[ -check-partner {true|false} ] - Check Partner Enabled**

Selects configuration information for nodes that have the specified partner-checking setting.

**[ -detection-time <integer> ] - Takeover Detection Time (secs)**

Selects configuration information for nodes that have the specified takeover detection time setting.

**[ -onfailure {true|false} ] - Takeover on Failure Enabled**

Selects configuration information for nodes that have the specified takeover-on-failure setting.

**[ -onpanic {true|false} ] - Takeover on Panic Enabled**

Selects configuration information for nodes that have the specified takeover-on-panic setting.

**[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled**

Selects configuration information for nodes that have the specified takeover-on-short-uptime setting.

**[-short-uptime <integer>] - Short Uptime (secs)**

Selects configuration information for nodes that have the specified takeover-on-short-uptime time setting.

**[-attempts <integer>] - Number of Giveback Attempts**

Selects configuration information for nodes that have the specified number of giveback attempts setting.

**[-attempts-time <integer>] - Giveback Attempts Minutes**

Selects configuration information for nodes that have the specified giveback attempt time setting.

**[-propagate {true|false}] - Propagate Status via Mailbox**

Selects configuration information for nodes that have the specified setting for propagation of status through Storage Failover mailboxes.

**[-read-interval <integer>] - Node Status Read Interval (secs)**

Selects configuration information for nodes that have the specified status read interval setting.

**[-write-interval <integer>] - Node Status Write Interval (secs)**

Selects configuration information for nodes that have the specified status write interval setting.

**[-onreboot {true|false}] - Takeover on Reboot Enabled**

Selects configuration information for nodes that have the specified takeover-on-reboot setting.

**[-delay-seconds <integer>] - Delay Before Auto Giveback (secs)**

If this parameter is specified, the command displays information only about the node or nodes that have the specified delay for auto giveback.

**[-hwassist {true|false}] - Hwassist Enabled**

Selects configuration information for nodes that have the specified hardware-assisted takeover setting.

**[-hwassist-partner-ip <text>] - Partner's Hwassist IP**

Selects configuration information for nodes that have the specified partner IP setting for hardware-assisted takeovers.

**[-hwassist-partner-port <integer>] - Partner's Hwassist Port**

Selects configuration information for nodes that have the specified partner port setting for hardware-assisted takeovers.

**[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)**

Selects configuration information for nodes that have the specified health check interval setting

for hardware-assisted takeovers

### **[-hwassist-retry-count <integer>] - Hwassist Retry Count**

Selects configuration information for nodes that have the specified retry count (in seconds) for hardware-assisted takeovers.

### **[-mode {ha|non\_ha}] - HA Mode**

If this parameter is specified, the command displays information only about the node or nodes that have the specified HA mode.

### **[-bypass-takeover-optimization {true|false}] - Bypass Takeover Optimization Enabled**

Selects configuration information for nodes that have the specified setting for bypass takeover optimization ( **\_ true\_** means that optimized operator-initiated planned takeover is bypassed, **false** means that it is enabled). Operator-initiated planned takeover is optimized when SFO aggregates are relocated serially to the partner prior to takeover. This reduces client outage.

## Examples

The following example displays detailed information about the internal options for storage failover on a node named node2:

```
cluster1::*> storage failover internal-options show -node node2
Node: node2
                Auto Giveback Enabled: false
                Check Partner Enabled: true
                Takeover Detection Time (secs): 15
                Takeover On Failure Enabled: true
                Takeover On Panic Enabled: false
                Takeover On Short Uptime Enabled: true
                Short Uptime (secs): -
                Number of Giveback Attempts: 3
                Giveback Attempts Minutes: 10
                Propagate Status Via Mailbox: true
                Node Status Read Interval (secs): 5
                Node Status Write Interval (secs): 5
                Failover the Storage when Cluster Ports Are Down: -
                Failover Interval when Cluster Ports Are Down (secs): -
                Takeover on Reboot Enabled: true
                Delay Before Auto Giveback (secs): 300
                Hardware Assist Enabled: true
                Partner's Hw-assist IP:
                Partner's Hw-assist Port: 4444
                Hw-assist Health Check Interval (secs): 180
                Hw-assist Retry count: 2
                HA mode: ha
                Bypass Takeover Optimization Enabled: true
```

# storage failover mailbox-disk show

Display information about storage failover mailbox disks

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage failover mailbox-disk show** command lists the mailbox disks that are used by storage failover. The command displays the following information:

- Node name
- Whether the mailbox disk is owned by the local node or by its partner
- Disk name
- Disk universal unique identifier (UUID)

This command is available only at the advanced privilege level and higher.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If **-fields <fieldname>, ...** is used, the command displays only the specified fields.

**[ -instance ] }**

If this parameter is used, the command displays detailed information about all entries.

**[ -node {<nodename>|local} ] - Node**

Selects the mailbox disks that are associated with the specified node.

**[ -location {local|partner|tertiary} ] - Mailbox Owner**

Selects the mailbox disks that have the specified relationship to the node.

**[ -diskindex <integer> ] - Mailbox Disk Index**

Selects the mailbox disk that has the specified index number.

**[ -diskname <text> ] - Mailbox Disk Name**

Selects the mailbox disks that match the specified disk name.

**[ -diskuuid <text> ] - Mailbox Disk UUID**

Selects the mailbox disks that match the specified UUID.

**[ -physical-location {local|partner|mediator} ] - Mailbox Disk Physical Location**

Selects the mailbox disks that match the specified physical location.

**[-location-id <nvramid>] - System ID of the Node where the Disk is Attached**

Selects the mailbox disks that match the specified location-id.

**[-location-name <text>] - Mailbox Disk Location**

Selects the mailbox disks that match the specified location-name.

## Examples

The following example displays information about the mailbox disks on a node named node1:

```
cluster1::*> storage failover mailbox-disk show -node node1
Node      Location  Index Disk Name      Physical Location  Disk UUID
-----
node1
  local    0 1.0.4      local    20000000:8777E9D6:[...]
  local    1 1.0.6      partner  20000000:8777E9DE:[...]
  partner  0 1.0.1      local    20000000:877BA634:[...]
  partner  1 1.0.2      partner  20000000:8777C1F2:[...]
```

## storage failover progress-table show

Display status information about storage failover operations

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage failover progress-table show** displays status information about storage-failover operations. This information is organized in a resource table. The command displays the following information:

- Node name
- Resource-entry index number
- Resource-entry name
- Resource-entry state
- Resource-entry failure code
- Resource-entry time delta

This command is available only at the advanced privilege level and higher.

## Parameters

**{ [-fields <fieldname>, ... ]}**

If -fields <fieldname>, ... is used, the command will only displays only the specified fields.

**{ [-instance ] }**

If this parameter is used, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node**

Selects the status information for the specified node.

**[-index <integer>] - Resource Table Index**

Selects the status information for the specified index number.

**[-entryname <text>] - Resource Table Entry Name**

Selects the status information for the specified entry name.

**[-state <text>] - Resource Table Entry State**

Selects the status information for the specified state. Possible values include UP, START\_RUNNING, START\_DONE, START\_FAILED, STOP\_RUNNING, STOP\_FAILED, TAKEOVER\_BARRIER, and ONLY\_WHEN\_INITD.

**[-failurecode <text>] - Entry Failure Code**

Selects the status information for the specified failure code. Possible values include OK, FAIL, FAIL\_ALWAYS, HANG, PANIC, and VETO.

**[-timedelta <integer>] - Entry Time Delta**

Selects the status information for the specified time delta.

## Examples

The following example displays the entire storage-failover resource table:

```
cluster1::*> storage failover progress-table show
Node   Entry Name                               State      Time Delta
-----
node0
  Pre-rsctbl: fmdisk_resumePartnerDi      start_done    6
  Pre-rsctbl: coredump_get_busy_spar      start_done   107
  Pre-rsctbl: raid_preread_labels_be      start_done    1

  rsctbl: takeover_test_1     start_done      0
```

## storage firmware download

Download disk, ACP processor and shelf firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **storage firmware download** command downloads the ACP processor, disk, and shelf module firmware to a specified node. This command can also be used to download the disk qualification package (DQP).

Use the [storage disk firmware update](#) command to install downloaded disk firmware.

Use the [storage shelf firmware update](#) command to install downloaded shelf module firmware.

Use the [system node run` local storage download acp`](#) command to install downloaded ACP processor firmware.

### Parameters

**-node {<nodename>|local} - Node**

This specifies the node to which the firmware is to be downloaded.

**-package-url <text> - Package URL**

This specifies the path to the firmware package.

The packaged ACP processor, disk, and shelf firmware files need to have ".AFW", ".LOD", and ".SFW" file extensions, respectively.

The following URL protocols are supported: ftp, http, tftp and file. The file URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as **file://usb0/<filename>** . The package must be present in the root directory of the USB mass storage device.

## Examples

The following example downloads a disk firmware package with the path `ftp://example.com/fw/disk-fw-1.2.LOD.zip` to a node named `node1`:

```
cluster1::> storage firmware download -node node1 -package-url
ftp://example.com/fw/disk-fw-1.2.LOD.zip
```

# storage firmware acp delete

Delete an ACP firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage firmware acp delete` command deletes the specified ACP processor firmware file from all nodes that are currently part of the cluster.

## Parameters

`-filename <text>` - Firmware Filename

Specifies the firmware file to delete.

## Examples

The following example deletes the ACP processor firmware file with the name `ACP-IOM3.0150.AFW.FVF` on each node:

```
cluster1::*> storage firmware acp delete -filename ACP-IOM3.0150.AFW.FVF
```

# storage firmware acp rename

Rename an ACP firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage firmware acp rename` command renames the specified ACP processor firmware file on each node.

## Parameters

**-oldname <text> - Old Filename**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename**

This parameter specifies the new name of the firmware file.

## Examples

The following example renames the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF to ACP-IOM3.AFW.FVF on each node:

```
cluster1::*> storage firmware acp rename -oldname ACP-IOM3.0150.AFW.FVF -newname ACP-IOM3.AFW.FVF
```

## storage firmware acp show

Display the list of ACP firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage firmware acp show` command displays the ACP processor firmware files present on each node.

## Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ [-instance ] ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the ACP processor firmware files on each node:

```
cluster1::> storage firmware acp show
Node: Node1
ACP Firmware Files
-----
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
ACP-IOM6.0210.AFW.FVF
Node: Node2
ACP Firmware Files
-----
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
ACP-IOM6.0210.AFW.FVF
8 entries were displayed.
```

## storage firmware disk delete

Delete a disk firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage firmware disk delete** command deletes the specified disk firmware file on each node.

## Parameters

**-filename <text> - Storage Firmware Filename**

Specifies the firmware file to delete.

## Examples

The following example deletes the disk firmware file with the name X262\_SMOOST25SSX.NA06.LOD

on each node:

```
cluster1::*> storage firmware disk delete -filename X262_SMOOST25SSX.NA06.LOD
```

## storage firmware disk rename

Rename a disk firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **storage firmware disk rename** command renames the specified disk firmware file on each node.

### Parameters

**-oldname <text> - Old Filename**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename**

This parameter specifies the new name of the firmware file.

### Examples

The following example renames the disk firmware file with the name X262\_SMOOST25SSX.NA06.LOD to X262\_SMOOST25SSX.LOD on each node:

```
cluster1::*> storage firmware disk rename -oldname X262_SMOOST25SSX.NA06.LOD -newname X262_SMOOST25SSX.LOD
```

## storage firmware disk show

Display the list of disk firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage firmware disk show** command displays the disk firmware files present on each node.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the disk firmware files on each node:

```
cluster1::> storage firmware disk show
Node: Node1
Disk Firmware Files
-----
X262_SMOOST25SSX.NA06.LOD
X262_SMOOST25SSX.NA06.LOD.FVF
X267_SMOOST50SSX.NA06.LOD
X267_SMOOST50SSX.NA06.LOD.FVF
Node: Node2
Disk Firmware Files
-----
X262_SMOOST25SSX.NA06.LOD
X262_SMOOST25SSX.NA06.LOD.FVF
X267_SMOOST50SSX.NA06.LOD
X267_SMOOST50SSX.NA06.LOD.FVF
8 entries were displayed.
```

## storage firmware hba show

Display the list of HBA firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage firmware hba show** command displays the HBA firmware files present on each node. For MCC configs, run the command on each DR group.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the HBA firmware files on each node:

```
cluster1::> storage firmware hba show
Node: Node1
HBA Firmware Files
-----
PM8072.03080900.HFW
SAS3008.13000000.HFW
SAS3616W.12030003.HFW
PM8072.03080900.HFW
Node: Node2
HBA Firmware Files
-----
PM8072.03080900.HFW
SAS3008.13000000.HFW
SAS3616W.12030003.HFW
PM8072.03080900.HFW
8 entries were displayed.
```

## storage firmware shelf delete

Delete a shelf firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage firmware shelf delete** command deletes the specified shelf firmware file from all nodes that are currently part of the cluster.

## Parameters

**-filename <text> - Storage Firmware Filename**

Specifies the firmware file to delete.

## Examples

The following example deletes the shelf firmware file with the name IOM12.0210.SFW on each node:

```
cluster1::*> storage firmware shelf delete -filename IOM12.0210.SFW
```

# storage firmware shelf rename

Rename a shelf firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage firmware shelf rename** command renames the specified shelf firmware file on each node.

## Parameters

**-oldname <text> - Old Filename**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename**

This parameter specifies the new name of the firmware file.

## Examples

The following example renames the shelf firmware file with the name IOM12.0210.SFW to IOM12.000.SFW on each node:

```
cluster1::*> storage firmware shelf rename -oldname IOM12.0210.SFW -newname
```

IOM12.000.SFW

# storage firmware shelf show

Display the list of shelf firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage firmware shelf show** command displays the shelf firmware files present on each node.

## Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ [-instance ] ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[ -node {<nodename>|local} ] - Node

Selects the files that match the specified node name.

[ -filename <text> ] - Storage Firmware File

Selects the files that match the specified filename.

## Examples

The following example displays the shelf firmware files on each node:

```
cluster1::> storage firmware shelf show
Node: Node1
Shelf Firmware Files
-----
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF
Node: Node2
Shelf Firmware Files
-----
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
```

```
ESH4.1400.SFW.FVF
8 entries were displayed.
```

# storage iscsi-initiator add-target

Add an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage iscsi-initiator add-target** command adds an iSCSI target to a node's list of targets. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

### **-node {<nodename>|local} - Node**

Specifies the name of the Data ONTAP node to which the iSCSI target will be added.

### **-label <text> - User Defined Identifier**

Specifies a label for the target to be added.

### **-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner} - Target Type**

Specifies the type of the target. It is used by the node to determine how to use the LUNs. There are five target types:

- **partner** - The partner target should belong to the node's HA partner. This allows the node to access its partner's disks.
- **mailbox** - A mailbox target's LUNs are used exclusively as HA mailboxes.
- **external** - External targets' LUNs can be used by the node but do not play a role in HA.
- **dr\_auxiliary** - The DR auxiliary target for MetroCluster over IP. Not a valid target type for the add-target command.
- **dr\_partner** - The DR partner target for MetroCluster over IP. Not a valid target type for the add-target command.

### **-target-portal <text> - Target Portal**

Specifies the target's IP address and listening TCP port. The port is not required if it is the default iSCSI port (3260). Examples of correct target portals are **10.0.0.2** and **10.0.0.2:860**.

### **-target-name <text> - iSCSI Name**

Specifies the iSCSI target name such as an IQN (iSCSI qualified name).

### **[-status-admin {down|up}] - Administrative Status (default: up)**

Use to specify whether the initial administrative status of the connection is up or down. The

default setting is **up** .

## Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator add-target -node node1
              -label target1 -target-type external
              -target-portal 10.0.0.2:860
              -target-name iqn.2012-06.com.bsdctl:target0
```

## storage iscsi-initiator connect

Connect to an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage iscsi-initiator connect** command connects a node to the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

**-node {<nodename>|local} - Node**

Specifies the name of the Data ONTAP node to which the iSCSI target will be connected.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier**

Specifies the label of the target to connect to.

## Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator connect -node node1
              -label target1
```

## storage iscsi-initiator disconnect

## Disconnect from an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **storage iscsi-initiator disconnect** command disconnects a node from the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

### Parameters

**-node {<nodename>|local} - Node**

Specifies the name of the Data ONTAP node from which the iSCSI target will be disconnected.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier**

Specifies the label of the target to disconnect from.

### Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator disconnect -node node1
          -label target1
```

## storage iscsi-initiator remove-target

### Remove an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **storage iscsi-initiator remove-target** command removes an iSCSI target from a node's list of targets. This command is only supported on high-availability shared-nothing virtualized platforms.

### Parameters

**-node {<nodename>|local} - Node**

Specifies the name of the Data ONTAP node from which the iSCSI target will be removed.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier**

Specifies the label of the target to be removed.

## Examples

The following example adds and connects to an iSCSI target from the specified **node**.

```
cluster1::*> storage iscsi-initiator remove-target -node node1
                -label target1
```

## storage iscsi-initiator show

Display the iSCSI targets

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage iscsi-initiator show** displays the list of iSCSI targets configured for each Data ONTAP node in the cluster. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Represents the name of the Data ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type**

Selects targets with the specified target type.

**[-label <text>] - User Defined Identifier**

Selects targets with the specified label.

**[-target-portal <text>] - Target Portal**

Selects targets with the specified portal.

**[-target-name <text>] - iSCSI Name**

Selects targets with the specified target name.

**[-status-admin {down|up}] - Administrative Status**

Selects targets with the specified administrative status.

**[-status-oper {down|up}] - Operational Status**

Selects targets with the specified operational status.

**[-failure-reason <text>] - Failure Reason**

Selects targets with the specified failure reason.

## Examples

The following example displays the list of iSCSI targets for each node in the cluster.

```
cluster1::*> storage iscsi-initiator show
```

Node	Type	Label	Target Portal	Target Name	Status Admin/Op
node1					
	mailbox				
	mediator		10.235.14.141	iqn.2012-05.local:mailbox.group.1	up/up
	partner				
	partner		10.63.7.205:65200	iqn.2012-06.com.bsdctl:target0	up/up
node2					
	mailbox				
	mediator		10.235.14.141	iqn.2012-05.local:mailbox.group.1	up/up
	partner				
	partner		10.63.7.201:65200	iqn.2012-06.com.bsdctl:target0	up/up

4 entries were displayed.

## storage path quiesce

Quiesce I/O on a path to array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage path quiesce** command quiesces I/O on one path to a LUN. It also quiesces the given entire path immediately or can monitor the given path for error threshold before quiesce. After the I/O has been quiesced, no new I/O is sent on the path unless the [storage path resume](#) command is

issued to continue I/O.

## Parameters

### **-node {<nodename>|local} - Node name**

The name of the clustered node for which information is being displayed.

### **-initiator <initiator name> - Initiator Port**

Initiator port that the clustered node uses.

### **-target-wwpn <wwpn name> - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

### **{ [-lun-number <integer>] - LUN Number**

Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.

### **[ [-path-failure-threshold <integer>] - Max Number of Path Failures Acceptable During wait-duration**

The path failure count, exceeding this value within wait duration will quiesce the path.

### **[-wait-duration <integer>] - Wait Duration in minutes }**

The time duration(minutes) in which path is monitored for path failures.

## Examples

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -lun-number 1
```

The following example suspends I/O immediately between node vbv3170f1b, port 0a and the array port 50001fe1500a8669.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669
```

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669 after reaching 10 or more errors in duration of 5 mins.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -path-failure-threshold 10 -wait-duration 5
```

## Related Links

- [storage path resume](#)

# storage path resume

Resume I/O on a path to array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage path resume** command continues I/O flow to an array LUN on a path or the entire path that was previously quiesced. It also disables the path failures monitoring feature, if it was enabled using the **storage path quiesce** `-path-failure-threshold`count` command.

## Parameters

**-node {<nodename>|local}** - Node name

The name of the clustered node for which information is being displayed.

**-initiator <initiator name>** - Initiator Port

Initiator port that the clustered node uses.

**-target-wwpn <wwpn name>** - Target Port

Target World Wide Port Name. Port on the storage array that is being used.

**[-lun-number <integer>]** - LUN Number

Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.

## Examples

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -lun-number 1
```

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669
```

## Related Links

- [storage path quiesce](#)

# storage path show-by-initiator

Display a list of paths to attached arrays from the initiator's perspective

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage path show-by-initiator` command displays path based statistics. The output is similar to the `storage path show` command but the output is listed by initiator.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ -instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Controller name`

The name of the clustered node for which information is being displayed.

`[-initiator <text>] - Initiator Port`

Initiator port that the clustered node uses.

`[-target-wwpn <text>] - Target Port`

Target World Wide Port Name. Port on the storage array that is being used.

`[-initiator-side-switch-port <text>] - Initiator Side Switch Port`

Switch port connected to the clustered node.

`[-target-side-switch-port <text>] - Target Side Switch Port`

Switch port connected to the array.

`[-array-name <array name>] - Array Name`

Name of the storage array that is connected to the cluster.

`[-tpgn <integer>] - Target Port Group Number`

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the path.

**[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the path

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

**[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

## Examples

```

## Related Links

- [storage path show](#)

# storage path show

Display a list of paths to attached arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage path show** command displays path based statistics. The default command shows:

- Node name
- Initiator port
- Target port
- Target IQN
- TPGN
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

## Parameters

{ [-fields <fieldname>, ... ]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-array ]

Using this option displays:

- Array name
- Target port
- Target IQN
- Target I/O in Kbytes/sec
- Target side switch port
- Path I/O in Kbytes/sec
- Initiator side switch port
- Initiator I/O in Kbytes/sec
- Initiator port

| [-by-target ]

Using this option displays the same information as the array option, but grouped by target port.

**[ [-detail ]**

Using this option displays the same information as the array and by-target options, but adds the following:

- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

**[ [-switch ]**

Using this option adds switch port information to the default display.

**[ [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-array-name <array name>] - Array Name**

Name of the storage array that is connected to the cluster.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the path.

**[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the path

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

**[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the array.

**[-path-link-errors <integer>] - Link Error count on path**

Fibre Channel link error count.

**[-path-quality <integer>] - Percentage of weighted error threshold**

A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

**[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path**

Number of LUNs on this path.

**[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator**

Number of LUNs on this initiator.

**[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target**

Number of LUNs on this target.

**[-vmdisk-device-id <integer>] - Virtual disk device ID**

Common device identifier, shared by a VM and its hypervisor, of a virtual disk. On ESX servers, this is the Disk ID component of a virtual device node, with a value of 0 to 15.

**[-path-failure-threshold <integer>] - Max number of path failures acceptable in wait-duration**

The path failure count, exceeding this value within wait duration will quiesce the path.

**[-wait-duration <integer>] - Wait Duration in minutes**

The time duration(minutes) in which path is monitored for path failures.

## Examples

The following example shows the default display.

```
vbv3170f2a::> storage path show
```

I/O Node (KB/s)	IOPS	Initiator	Array Target Port	TPGN	Speed	Path

## storage pool add

Add disks to a storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage pool add** command increases the total capacity of an existing storage pool by adding the specified SSDs to the storage pool. The disks are split into four equal partitions and added to each of the allocation units of the storage pool. If any allocation units from the storage pool have already been allocated to an aggregate, the cache capacity of that aggregate is increased automatically.

For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache capacity by 186.2 GB. If a different allocation is desired, create a new storage pool using the [storage pool create](#) command.

Storage pools are not supported in all-flash aggregates.

## Parameters

### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool to which disks are to be added.

### **{ [-disk-count <integer>] - Number of Disks to Add in Storage Pool**

This parameter specifies the number of disks that are to be added to the storage pool. The disks to be added come from the pool of spare disks.

### **[-nodes {<nodename>|local}] - Nodes From Which Spares Should be Selected**

This parameter specifies a list of nodes from which SSD disks are selected for addition to the storage pool. If this parameter is not specified, disks to be added to the storage pool can be selected from both the nodes sharing the storage pool. Use this parameter to restrict the selection of spare disks to one particular node.

### **[-disk-list <disk path name>,...] - List of Spare Disks }**

This parameter specifies a list of disks to be added to the storage pool. In an HA configuration, SSDs being added to a storage pool can be owned by either node in the HA pair.

### **{ [-quiet <true>] - Confirmations off**

When set to **true**, this parameter specifies the operation should be executed without pausing for confirmation.

### **[-simulate <true>] - Simulate Storage Pool Addition**

When set to **true**, this parameter specifies the operation should be performed as a simulation. The command reports which aggregates would grow automatically as a result of adding the disks to the storage pool. The disks are not added to the storage pool.

## Examples

In this example, the user requests a report detailing the changes that would occur if a new disk is

added to the storage pool **SP1** . In this case, 186.2 GB of cache is added to the Flash Pool aggregates nodeA\_flashpool\_1 and nodeB\_flashpool\_1. There are two unprovisioned allocation units in the storage pool and therefore the storage pool available capacity also grows by 372.5 GB.

```
cluster1::> storage pool add -storage-pool SP1 -disk-list 1.0.23 -simulate
```

This operation will result in capacity being allocated in the following way:

Container Name	Capacity To Be Added	Current Size	New Size
nodeA_flashpool_1	186.2GB	558.7GB	744.9GB
nodeB_flashpool_1	186.2GB	558.7GB	744.9GB
(Available Capacity)	372.5GB	1.09TB	1.45TB

The following example adds one disk to a storage pool named **SP1** . The spare disks are selected from either local node or its partner or both based on spare availability.

```
cluster-1::> storage pool add -storage-pool SP1 -disk-count 1
```

Info: The following disks will be added to storage pool "SP1":

Disk	Size	Type	Owner
1.0.12	744.9GB	SSD	cluster-1-01

New Allocation Unit Size: 744.8GB

Capacity will be allocated in the following way:

Container Name	Capacity To Be Added	Current Size	New Size
nodeA_flashpool_1	186.2GB	558.7GB	744.9GB
nodeB_flashpool_1	186.2GB	558.7GB	744.9GB
(Available Capacity)	372.5GB	1.09TB	1.45TB

Are you sure you want to continue with this operation?

{y|n}: y

[Job 48] Job succeeded: storage pool add job for "SP1" completed successfully

## Related Links

- [storage pool create](#)

# storage pool create

Create a new storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage pool create** command creates an SSD storage pool using a given list of spare SSDs.

When a storage pool is created, Data ONTAP splits the capacity provided by the SSDs into four equally-sized allocation units. In an HA configuration, two allocation units (containing 50% of the total capacity) are assigned to each node in the HA pair. This assignment can be modified using the [storage pool reassign](#) command.

After the storage pool is created, its allocation units can be provisioned into Flash Pool aggregates using the [storage aggregate add-disks](#) command and the **-storage-pool** parameter.

Storage pools are not supported in All-Flash aggregates.

## Parameters

### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the name of the storage pool that is to be created. The SSDs are partitioned and placed into the new storage pool.

### **{ [-nodes {<nodename>|local}] - Nodes Sharing the Storage Pool**

This parameter specifies a list of nodes from which SSD disks are selected to create the storage pool. If two nodes are specified then they need to be in HA configuration. Spare disks are selected from either node or its partner or both. If this parameter is not specified, storage pool will be created by selecting disks from either the node or its partner or both from where command is run.

### **-disk-count <integer> - Number of Disks in Storage Pool**

This parameter specifies the number of disks that are to be included in the storage pool. The disks in this newly created storage pool come from the pool of spare disks. The smallest disks in this pool are added to the storage pool first, unless you specify the **-disk-size** parameter.

### **[-disk-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Size**

This parameter specifies the size of the disks on which the storage pool is to be created. Disks with a usable size between 95% and 105% of the specified size are selected.

### **[-disk-list <disk path name>, ... - Disk List for Storage Pool Creation }**

This parameter specifies a list of SSDs to be included in the new storage pool. The SSDs must be spare disks and can be owned by either node in an HA pair.

### **[-simulate <true>] - Simulate Storage Pool Creation**

This option simulates the storage pool creation and prints the allocation unit size that would be used for the storage pool.

## Examples

The following example creates a storage pool named SP1. The storage pool contains 3 SSD disks, the

spare disks selected are from either local node, or its partner or both based on spare availability.

```
cluster1::> storage pool create -storage-pool SP1 -disk-count 3
```

The following example creates a storage pool named SP2. The storage pool contains 3 SSD disks, the spare disks selected are from either node0, or its partner node1 or both based on spare availability.

```
cluster1::> storage pool create -storage-pool SP2 -disk-count 3 -nodes node0,node1
```

The following example creates a storage pool named SP3 from four SSDs using disk list.

```
cluster1::> storage pool create -storage-pool SP3 -disk-list 1.0.13, 1.0.15, 1.0.17, 1.0.19
```

## Related Links

- [storage pool reassign](#)
- [storage aggregate add-disks](#)

# storage pool delete

Delete an existing storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage pool delete** command deletes an existing SSD storage pool. At the end of the operation, the SSDs are converted back to spare disks.

## Parameters

**-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool that you want to delete. You can delete the storage pool only if all of the allocation units in the storage pool are available.

## Examples

Verify that storage pool **SP3** is ready for deletion by confirming it has four available allocation units and then delete it.

```
cluster1::> storage pool show-available-capacity -storage-pool SP3
```

```

Node           Storage Pool  Storage Type  SyncMirror Pool  Allocation Unit size  Unit Count  Total Usable Size
-----
node-a         SP3           SSD           Pool0           372.5GB           2           744.9GB
node-b         SP3           SSD           Pool0           372.5GB           2           744.9GB
2 entries were displayed.

```

```
cluster1::> storage pool delete -storage-pool SP3
```

```
Warning: Are you sure you want to delete storage pool "SP3"? {y|n}: y
[Job 313] Job succeeded: storage pool delete job for "SP3" completed successfully
```

## storage pool reassign

Reassign capacity from one node to another node in storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage pool reassign** command changes the ownership of unprovisioned (available) storage pool allocation units from one HA partner to the other for an existing storage pool.

### Parameters

**-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool within which available capacity is reassigned from one node to another.

**-from-node {<nodename>|local} - Reassign Available Capacity from This Node**

This parameter specifies the name of the node that currently owns the allocation units.

**-to-node {<nodename>|local} - Reassign Available Capacity to This Node**

This parameter specifies the name of the node that will now own the allocation units.

**-allocation-units <integer> - Allocation Units**

This parameter specifies the number of allocation units to be reassigned.

### Examples

Move an available allocation unit from node-b to node-a in preparation for provisioning the allocation units on node-a.

```
cluster1::*> storage pool show-available-capacity -storage-pool SP2
Storage SyncMirror Allocation Unit Total
```

```

Node      Storage Pool  Type  Pool      Unit size  Count  Usable Size
-----
node-a    SP2            SSD   Pool0     744.9GB   2      1.45TB
node-b    SP2            SSD   Pool0     744.9GB   1      744.9GB
2 entries were displayed.

```

```

cluster1::*> storage pool reassign -storage-pool SP2 -from-node node-b -to-node node-a
-allocation-units 1

```

```

[Job 310] Job succeeded: storage pool reassign job for "SP2" completed successfully

```

```

cluster1::*> storage pool show-available-capacity -storage-pool SP2
Storage SyncMirror Allocation Unit Total
Node      Storage Pool  Type  Pool      Unit size  Count  Usable Size
-----
node-a    SP2            SSD   Pool0     744.9GB   3      2.18TB
node-b    SP2            SSD   Pool0     744.9GB   0      0B
2 entries were displayed.

```

## storage pool rename

### Rename storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool rename` command changes the name of the storage pool.

## Parameters

**-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool name.

**-new-name <storage pool name> - New Name of the Storage Pool**

This parameter specifies the new name of the storage pool.

## Examples

Renaming storage pool "sp1" to "sp2"

```

cluster-1::> storage pool show
Storage
Storage Pool  Type  #Disks  Nodes          Total Size
-----
sp1           SSD   4       node-a,
              node-b         10.44GB

```

```
cluster-1::> storage pool rename -storage-pool sp1 -new-name sp2
```

```
cluster-1::> storage pool show
```

Storage Pool	Storage Type	#Disks	Nodes	Total Size
sp2	SSD	4	node-a, node-b	10.44GB

## storage pool show-aggregate

Display aggregates provisioned from storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage pool show-aggregate** command displays allocation information for SSD storage pools in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about allocations of all storage pools in the cluster.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -storage-pool <storage pool name> ] - Name of Storage Pool**

Selects the storage pools that match this parameter value.

**[ -aggregate <aggregate name> ] - Aggregate**

Selects the storage pools that match this parameter value.

**[ -capacity {<integer>[KB|MB|GB|TB|PB]} ] - Capacity**

Selects the storage pools that match this parameter value.

Capacity includes space provided by data and parity portions of each allocation unit. Only the data portions of each allocation unit contribute to the cache or usable capacity of Flash Pool.

**[-allocated-unit-count <integer>] - Number of AU's Assigned to This Aggregate**

Selects the storage pools that match this parameter value.

**[-original-owner <text>] - Original Owner Name**

Selects the storage pools that match this parameter value.

**[-node {<nodename>|local}] - Node**

Selects the storage pools that match this parameter value.

## Examples

Display information about the aggregate or aggregates using a storage pool called **SP2** :

```
cluster1::> storage pool show-aggregate -storage-pool SP2 -instance
Name of Storage Pool: SP2
                        Aggregate: node2_flashpool_1
                        Capacity: 744.9GB
Number of AU's Assigned to This Aggregate: 1
                        Original Owner Name: node2
                        Node: node2
```

## storage pool show-available-capacity

Display available capacity of storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage pool show-available-capacity** command displays information about available capacity in SSD storage pools on each node in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about available capacities in all shared pools in the cluster.

Storage pool available capacity is data storage space that has not yet been provisioned into Flash Pool. Allocation units might be provisioned into aggregates using the [storage aggregate add-disks](#) command and the **-storage-pool** parameter.

All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, Data ONTAP moves a suitable whole SSD spare disk from outside the storage pool into the storage pool and begins the recovery process (using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Name of Storage Pool**

Selects the available capacities that match this parameter value.

**[-node {<nodename>|local}] - Node**

Selects the available capacities that match this parameter value.

**[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Size**

Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates.

**[-storage-type <SSD>] - Type of Storage Pool**

Selects the available capacities that match this parameter value. Only the **SSD** type is supported for this version of Data ONTAP.

**[-allocation-unit-count <integer>] - Number of Allocation Units Available**

Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates. Each allocation unit is one minimum unit of allocation (MUA) and its capacity is given as **allocation-unit-size**.

**[-syncmirror-pool <text>] - SyncMirror Pool**

Selects the available capacities that match this parameter value.

The SyncMirror pool of an allocation unit must match the SyncMirror pool of the disks of the aggregate when adding allocation units into an aggregate.

Mirroring of aggregates that are provisioned from SSD storage pools is not supported.

**[-available-size {<integer>[KB|MB|GB|TB|PB]}] - Total Usable Available Size**

Selects the available capacities that match this parameter value.

The **available-size** is the sum of the capacities of the allocation units that are assigned but not yet provisioned. The amount of **available-size** that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

## Examples

In this example, two nodes of an HA pair share available capacity from two storage pools, **SP1** and **SP2**. There are a total of 5 allocation units that have not yet been provisioned.

```
cluster1::> storage pool show-available-capacity
```

Node	Storage Pool	Storage Type	SyncMirror Pool	Allocation Unit size	Unit Count	Total Usable Size
node-a	SP1	SSD	Pool0	558.7GB	1	558.7GB
node-b	SP1	SSD	Pool0	558.7GB	1	558.7GB
node-a	SP2	SSD	Pool0	744.9GB	2	1.45TB
node-b	SP2	SSD	Pool0	744.9GB	1	744.9GB

# storage pool show-disks

Display disks in storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage pool show-disks** command displays information about disks in storage pools in the cluster. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all disks in all storage pools in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Name of Storage Pool**

Selects the storage pools that match this parameter value.

**[-disk <disk path name>] - Name of the disk**

Selects the storage pools with the disks that match this parameter value.

**[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

Selects the storage pools with the disks that match this parameter value. Only the **SSD** type is supported for this version of Data ONTAP.

**[-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Usable Size**

Selects the storage pools with the disks that match this parameter value.

In this command, **usable-size** refers to the sum of the capacities of all of the partitions on the disk.

**[-total-size {<integer>[KB|MB|GB|TB|PB]}] - Total Size**

Selects the storage pools with the disks that match this parameter value.

**[-node-list <nodename>, ...] - List of Nodes**

Selects the storage pools with the disks that are visible to all of the specified nodes.

## Examples

Show information about SSDs in a storage pool called **SP2**.

```
cluster1::> storage pool show-disks -storage-pool SP2
```

```
Storage Pool Name: SP2
```

```
Storage
```

Disk	Type	Usable Size	Total Size
1.0.16	SSD	745.0GB	745.2GB
1.0.18	SSD	745.0GB	745.2GB
1.0.20	SSD	745.0GB	745.2GB
1.0.22	SSD	745.0GB	745.2GB

## storage pool show

Display details of storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage pool show** command displays information about SSD storage pools in the cluster. By default, the command displays information about all storage pools in the cluster. You can specify parameters to limit the output to a specific set of storage pools.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Storage Pool Name**

Selects the storage pools that match this parameter value.

**[-storage-pool-uuid <UUID>] - UUID of Storage Pool**

Selects the storage pools that match this parameter value.

**[-nodes {<nodename>|local}] - Nodes Sharing the Storage Pool**

Selects the storage pools that match this parameter value.

In an HA pair, either node name may be specified.

**[-disk-count <integer>] - Number of Disks in Storage Pool**

Selects the storage pools that match this parameter value.

**[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Size**

Selects the storage pools that match this parameter value.

Allocation units represent the unit of storage allocated to aggregates from this storage pool.

**[-allocation-unit-data-size-raid4 {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID4 and RAID-EP**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with **-raidtype** as **raid4** or **raid\_ep** .

**[-allocation-unit-data-size-raid-dp {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID-DP**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with **-raidtype** as **raid\_dp** .

**[-allocation-unit-data-size-raid-tec {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID-TEC**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with **-raidtype** as **raid\_tec** .

**[-storage-type <SSD>] - Storage Type**

Selects the storage pools that match this parameter value.

Only the **SSD** type is supported for this version of Data ONTAP.

**[-pool-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Storage Pool Usable Size**

Selects the storage pools that match this parameter value.

The **pool-usable-size** is the sum of the capacities of the allocation units that are assigned to nodes but not yet provisioned. The amount of **pool-usable-size** that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

**[-pool-total-size {<integer>[KB|MB|GB|TB|PB]}] - Storage Pool Total Size**

Selects the storage pools that match this parameter value.

The **pool-total-size** is the sum of the capacities of allocation units belonging to this storage pool.

**[-is-healthy {true|false}] - Is Pool Healthy?**

Selects the storage pools that match this parameter value.

For storage pools with **is-healthy`false** , the **`unhealthy-reason** parameter provides more information.

**is-healthy** must be **true** to provision allocation units from a storage pool into an aggregate.

**[-pool-state <State of the Storage Pool>] - State of the Storage Pool**

Selects the storage pools that match this parameter value. Possible states are:

- normal - the storage pool is operating normally.
- degraded - the storage pool has one or more failed disks.
- creating - the storage pool is being created.
- deleting - the storage pool is being deleted.
- reassigning - allocation units are being reassigned from one node to another.
- growing - allocation units in the storage pool are expanding due to the addition of new capacity into the storage pool.

**[-unhealthy-reason <text>] - Reason for Storage Pool Being Unhealthy**

Selects the storage pools that match this parameter value.

The message provided gives additional details about why the storage pool is unhealthy.

**[-current-operation-job-id <integer>] - Job ID of the Currently Running Operation**

Selects the storage pools that match this parameter value.

Long-running operations associated with storage pools will be managed via jobs. For example, if you provision allocation units from a storage pool into an aggregate and the disks associated with the storage pool need to be zeroed, the operation will be completed via a job.

## Examples

Display the storage pools in the cluster.

```
cluster1::> storage pool show
Storage Pool      Type  #Disks Nodes                Total Size
-----
LargeSP           SSD   10 noda-a,node-b        7.27TB
SmallSP           SSD   2  noda-a,node-b        1.45TB
2 entries were displayed.
```

The following example displays the details of a storage pool named SmallSP. Only one of its four allocation unit has been provisioned, so 75% of its size is available (usable).

```
cluster1::> storage pool show -storage-pool SmallSP
Storage Pool Name: SmallSP
                UUID of Storage Pool: 60f2f1b9-e60f-11e3-a5e7-00a0981899a2
                Nodes Sharing the Storage Pool: node-a, node-b
                Number of Disks in Storage Pool: 2
                Allocation Unit Size: 372.5GB
                Storage Type: SSD
                Storage Pool Usable Size: 1.09TB
                Storage Pool Total Size: 1.45TB
                Is Pool Healthy?: true
                State of the Storage Pool: normal
                Reason for storage pool being unhealthy: -
                Job ID of the Currently Running Operation: -
```

## storage port disable

Disable a storage port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage port disable** command disables a specified storage port.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port**

Use this parameter to specify the port that needs to be disabled.

**[-force <>true>] - Force**

Use this optional parameter to force the disabling of the storage port. The parameter can be used to disable the specified port even if some devices can only be accessed using this port. Note that

doing so might cause multiple device failures.

## Examples

The following example disables port 0a on node node1:

```
cluster1::> storage port disable -node node1 -port 0a
```

## storage port enable

Enable a storage port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage port enable** command enables a specified storage port.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port**

Use this parameter to specify the port that needs to be enabled.

## Examples

The following example enables port 0a on node node1:

```
cluster1::> storage port enable -node node1 -port 0a
```

## storage port modify

Modify a storage port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage port modify** command modifies the attributes of a storage port.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies the name of the node.

### **-port <text> - Port**

This parameter specifies the name of the port.

### **[-mode {storage|network}] - Mode**

This parameter specifies the usage mode for an Ethernet port - storage or network use. The mode parameter only applies to Ethernet ports that are not dedicated to storage connectivity.

### **[-force <>true>] - Force**

This parameter allows the operation to override warnings.

## Examples

The following example places a nondedicated Ethernet port in storage mode:

```
cluster1::> storage port show
Speed
Node          Port Type  Mode   VLAN
              (Gb/s) State  Status  ID
-----
cluster1-01
  e0b ENET  network   - -    -
  e0c ENET  -         100 enabled online  30
  e0e ENET  storage   0 enabled offline 30
  e0f ENET  -         100 enabled online  30
cluster1-02
  e0b ENET  storage   0 enabled offline 30
  e0c ENET  -         100 enabled online  30
  e0e ENET  storage   0 enabled offline 30
  e0f ENET  -         100 enabled online  30
8 entries were displayed.

cluster1::> storage port modify -node cluster1-01 -port e0b -mode storage

cluster1::> storage port show
Speed
Node          Port Type  Mode   VLAN
              (Gb/s) State  Status  ID
-----
cluster1-01
  e0b ENET  storage   0 enabled offline 30
  e0c ENET  -         100 enabled online  30
  e0e ENET  storage   0 enabled offline 30
  e0f ENET  -         100 enabled online  30
cluster1-02
  e0b ENET  storage   0 enabled offline 30
```

storage port rescan

e0c	ENET	-	100	enabled	online	30
e0e	ENET	storage	0	enabled	offline	30
e0f	ENET	-	100	enabled	online	30

8 entries were displayed.

## storage port rescan

Rescan a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **storage port rescan** command rescans a specified storage port. This command is not supported on Ethernet storage ports (type = ENET).

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port**

Use this parameter to specify the port that needs to be rescanned.

### Examples

The following example rescans port 0a on node node1:

```
cluster1::> storage port rescan -node node1 -port 0a
```

## storage port reset-device

Reset a device behind a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `'storage port reset-device'` command resets a device behind a port. If the device is behind a SAS port, you need to specify the shelf name and bay ID where the device resides. If the device is behind a FC port, you need to specify the loop ID of the device. This command is not supported on Ethernet storage ports (type = ENET).

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port**

Use this parameter to specify the port used to reset the device.

**{ -shelf-name <text> - Shelf Name**

Use this parameter to specify the shelf where the device resides.

**-bay-id <integer> - Bay ID**

Use this parameter to specify the bay where the device resides.

**| -loop-id <integer> - Loop ID }**

Use this parameter to specify the loop ID of the device.

## Examples

The following example resets a device behind SAS port 0a on node node1:

```
cluster1::> storage port reset-device -node node1 -port 0a -shelf-name 1.0 -bay-id 10
```

The following example resets a device behind FC port 1b on node node1:

```
cluster1::> storage port reset-device -node node1 -port 1b -loop-id 20
```

## storage port reset

Reset a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage port reset** command resets a specified storage port. This command is not supported on Ethernet storage ports (type = ENET).

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port**

Use this parameter to specify the port that needs to be reset.

## Examples

The following example resets port 0a on node node1:

```
cluster1::> storage port reset -node node1 -port 0a
```

## storage port show

Show storage port information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage port show** command displays information about the storage ports in the cluster. If no parameters are specified, the default command displays the following information about the storage ports:

- Node
- Port
- Type
- Speed
- State
- Status

To display detailed profile information about a single storage port, use the **-node** and **-port** parameters.

## Parameters

{ [-fields <fieldname>, ...]

Displays the specified fields for all the storage ports, in column style output.

| [-errors ]

Displays the following error status information about the storage ports which have errors:

- Error type
- Error severity
- Error description

**[ -instance ] }**

Displays expanded information about all the storage ports in the system. If a storage port is specified, then this parameter displays detailed information for that port only.

**[ -node {<nodename>|local} ] - Node**

Displays detailed information about the storage ports on the specified node.

**[ -port <text> ] - Port**

Selects the ports with the specified port name.

**[ -port-type {Unknown|SAS|FC|ENET} ] - Port Type**

Selects the ports of the specified type.

**[ -port-speed {0|1|1.5|2|2.5|3|4|5|6|8|10|12|14|16|25|32|40|100} ] - Port Speed**

Selects the ports with the specified speed.

**[ -state {enabled|disabled|enable-pending|disable-pending} ] - Port State**

Selects the ports with the specified state.

**[ -status {unknown|online|online-degraded|offline|link-down} ] - Port Status**

Selects the ports with the specified operational status.

**[ -description <text> ] - Description**

Selects the ports with the specified description.

**[ -firmware-rev <text> ] - Firmware Revision**

Selects the ports with the specified firmware revision.

**[ -serial-number <text> ] - Serial Number**

Selects the ports with the specified serial number.

**[ -is-dedicated {true|false} ] - Is Dedicated Storage Port?**

Selects the ports that match the specified value for storage-only ports. This value is always true for FC and SAS ports, as well as for ENET ports that are dedicated to storage.

**[ -connection-mode {Unknown|Loop|Point-to-point} ] - Connection Mode**

Selects the ports with the specified connection mode.

**[ -wwnn <FC WWN> ] - World Wide Node Name**

Selects the ports with the specified World Wide Node Name.

**[ -wwpn <FC WWN> ] - World Wide Port Name**

Selects the ports with the specified World Wide Port Name.

**[ -board-name <text> ] - Board Name**

Selects the ports with the specified board name.

**[-connector-capabilities <integer>,...] - Connector Capabilities**

Selects the ports with the specified list of connector capabilities.

**[-wwn <FC WWN>] - Base World Wide Name**

Selects the ports with the specified World Wide Name.

**[-mfg-part-number <text>] - MFG Part Number**

Selects the ports with the specified manufacturer part number.

**[-nvdata-rev <text>] - NVDATA Revision**

Selects the ports with the specified NVDATA revision.

**[-part-number <text>] - Part Number**

Selects the ports with the specified part number.

**[-date-code <text>] - Date Code**

Selects the ports with the specified date code.

**[-connector-technology {active-copper|passive-copper|optical}] - Connector Technology**

Selects the ports with the specified connector technology.

**[-phy-id <integer>,...] - Phy ID**

Selects the ports that have phys with the specified phy ID.

**[-phy-state {enabled|disabled}] - Phy State**

Selects the ports that have phys with the specified state.

**[-phy-status {unknown|online|offline|speed-negotiation-failed|sata-oob-failed}] - Phy Status**

Selects the ports that have phys with the specified status.

**[-phy-speed {0|1|1.5|2|2.5|3|4|5|6|8|10|12|14|16|25|32|40|100}] - Phy Speed**

Selects the ports that have phys with the specified speed.

**[-mac-address <text>] - MAC Address**

Selects ports that match the specified MAC address.

**[-vlan-id <integer>] - VLAN ID**

Selects the ports with the specified VLAN ID.

**[-vendor-id <text>] - Vendor ID**

Selects the ports with the specified vendor ID.

**[-vendor-part-id <text>] - Vendor part ID**

Selects the ports with the specified vendor part ID.

**[-device-type <text>] - Device type**

Selects ports that match the specified device type.

**[-error-type {unknown|online|online-degraded|offline|link-down}] - Error Type**

Selects the ports with the specified error type.

**[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

Selects the ports with the specified error severity.

**[-error-text <text>] - Error Text**

Selects the ports with the specified error text.

**[-corrective-action <text>] - Corrective Action**

Selects the ports with the specified corrective action.

**[-cable-length <text>] - Cable Length**

Selects the ports with the specified cable length.

**[-cable-identifier <text>] - Cable Identifier**

Selects the ports with the specified cable identifier.

**[-cable-end-id {end\_0|end\_1}] - Cable End Identifier**

Selects the ports with the specified cable end identifier.

**[-connector-type {QSFP|QSFP+|QSFP28|Mini-SAS HD|SFP}] - Connector Type**

Selects the ports with the specified connector type.

**[-connector-vendor <text>] - Connector Vendor**

Selects the ports with the specified connector vendor.

**[-connector-part-number <text>] - Connector Part Number**

Selects the ports with the specified connector part number.

**[-connector-serial-number <text>] - Connector Serial Number**

Selects the ports with the specified connector serial number.

**[-mode {storage|network}] - Mode**

Selects the ports with the specified mode.

**[-is-redundant {true|false}] - Is Redundant?**

Selects the ports that are redundant (true) or not redundant (false). A port is redundant if all attached devices have a second path through another port.

**[-in-use {true|false}] - In Use?**

Selects the ports that are in use (true) or not in use (false). A port is in use if any devices are connected using this port.

## Examples

The following example displays information about all storage ports in the cluster:

```

cluster1::> storage port show
Speed          VLAN
Node           Port Type Mode   (Gb/s) State  Status  ID
-----
cluster1-01
  4a  SAS  -      0  enabled  offline -
  4b  SAS  -      0  enabled  offline -
  4c  SAS  -      0  enabled  offline -
  4d  SAS  -      0  enabled  offline -
  e3a ENET network - - - -
  e3b ENET storage 100 enabled  online  30
  e5a ENET storage 100 enabled  online  30
  e5b ENET network - - - -
cluster1-02
  4a  SAS  -      0  enabled  offline -
  4b  SAS  -      0  enabled  offline -
  4c  SAS  -      0  enabled  offline -
  4d  SAS  -      0  enabled  offline -
  e3a ENET network - - - -
  e3b ENET storage 100 enabled  online  30
  e5a ENET storage 100 enabled  online  30
  e5b ENET network - - - -
16 entries were displayed.

```

The following example displays detailed information about port e5a on node node1:

```

cluster1::> storage port show -node cluster1-01 -port e5a
Node: cluster1-01
      Port: e5a
      Port Type: ENET
      Mode: storage
      Description: 40G/100G Ethernet Controller CX5
      Firmware Revision: 16.23.1020
      MAC Address: ec:0d:9a:65:e4:44
      Is Dedicated: false
      Serial Number: MT1730X00227
      Connector Vendor: Molex Inc.
      Connector Part Number: 112-00322
      Connector Serial Number: 532120266
      Port Speed: 100 Gb/s
      Port State: enabled
      Port Status: online

```

## storage raid-options modify

Modify a RAID option

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage raid-options modify** command is used to modify the available RAID options for each node in a cluster. The options are described in the **storage raid-options** manual page.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node on which the RAID option is to be modified.

**-name <text> - Option Name**

This parameter specifies the RAID option to be modified. To see the list of RAID options that can be modified, use the [storage raid-options show](#) command.

**[-value <text>] - Option Value**

This parameter specifies the value of the selected RAID option.

## Related Links

- [storage raid-options show](#)

# storage raid-options show

Display RAID options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage raid-options show** command displays information about all the RAID options in a cluster. The options are described in the **storage raid-options** manual page.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about all the RAID options on the specified node.

**[-name <text>] - Option Name**

Selects information about the RAID options that have the specified name.

**[-value <text>] - Option Value**

Selects information about all the RAID options that have the specified value.

**[-recommended-value <text>] - Recommended Value**

Selects information about all the RAID options that have the specified recommended value.

**[-constraint <text>] - Option Constraint**

Selects information about all the RAID options that have the specified constraint. The 'constraint' field indicates the expected setting for a RAID option across both nodes of an HA pair. The possible values are:

- **none** - no constraint on the value of this RAID option; nodes can have different values
- **same\_preferred** - the same value should be used on both nodes of an HA pair, otherwise the next takeover may not function correctly
- **same\_required** - the same value must be used on both nodes of an HA pair, otherwise the next takeover will not function correctly
- **only\_one** - the same value should be used on both nodes of an HA pair. If the values are different and a takeover is in progress, the value of the RAID option on the node that is taking over will be used
- **unknown** - no information about constraints for this RAID option

## Examples

The following example shows the RAID scrub settings for a node named node1:

```
cluster1::> storage raid-options show -node node1 -name raid.scrub*
Node      Option                               Current      Recommended  Constraint
-----
node1     raid.scrub.perf_impact               low          low          only_one
node1     raid.scrub.enable                    on           off          none
2 entries were displayed.
```

## storage shelf show

Display a list of storage shelves

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage shelf show** command displays information about all the storage shelves in the storage system. If no parameters are specified, the default command displays the following information about the storage shelves:

- Shelf Name
- Shelf ID
- Serial Number
- Model
- Module Type
- Status

To display detailed profile information about a single storage shelf, use the **-shelf** parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the storage shelves, in column style output.

**| [-bay ]**

Displays the following details about the disk bays in the storage shelf:

- The unique positional identifier of the disk bay
- Whether a disk drive is installed in the bay
- Bay type
- Operational status of the disk bay

**| [-connectivity ]**

Displays the following details about the connectivity from the node to the storage shelf:

- Node name
- Initiator side switch port
- Target side switch port
- World-wide port name
- Target Port Group Number (TPGN)

**| [-cooling ]**

Displays the following details about the cooling elements and temperature sensors of the storage shelf:

- Element ID of the cooling fan
- The current speed of the cooling fan in revolutions per minute (rpm)

- Operational status of the cooling fan
- Sensor ID of the temperature sensor element
- Temperature at the sensor in degrees Celsius
- Whether the current temperature at the sensor is the ambient temperature
- Low critical threshold value for the temperature sensor
- Low warning threshold value for the temperature sensor
- High critical threshold value for the temperature sensor
- High warning threshold value for the temperature sensor
- Operational status for the temperature sensor

### **[ -errors ]**

Displays the following error status information about the storage shelves that have errors:

- Error type
- Error description

### **[ -module ]**

Displays the following details about the I/O modules attached to the storage shelf:

- Module ID
- Module part number
- Serial number of the Enclosure Services Controller Electronics element
- Whether monitoring is enabled on this module
- Whether this module is the SAS expander master module
- Whether this module is the element reporting
- Version of the firmware installed on the module
- Latest firmware revision
- Number of times, since the last boot, that this module has been swapped
- Operational status of the module

### **[ -port ]**

Displays the following details about the storage shelf ports:

- Expander phy element identifier
- SAS shelf port type
- World-wide Port Name of the SAS port
- Operational physical link rate of the SAS port in Gb/s
- Negotiated physical link rate of the SAS port in Gb/s
- Power status of the SAS port
- Status of the SAS port

- Fibre Channel shelf port ID
- Fibre Channel shelf port type
- Fibre Channel shelf port status

### **[ -power ]**

Displays the following details about the power supplies, voltage sensors, and current sensors of the storage shelf:

- Power Supply Unit (PSU) number
- PSU type
- PSU part number
- PSU serial number
- PSU power rating in watts
- PSU crest factor
- Power drawn from the PSU in watts
- Whether the PSU can be reset via software control
- Whether the auto power reset of the PSU is enabled
- PSU firmware revision
- Operational status of the PSU
- Voltage sensor number
- Voltage detected by the voltage sensor, in volts (V)
- Operational status of the voltage sensor
- Current sensor number
- Current detected by the current sensor, in milliamps (mA)
- Operational status of the current sensor

### **[ -instance ]**

Displays expanded information about all the storage shelves in the system.

### **[ -shelf <text> ] - Shelf Name**

Displays information only about the storage shelves that match the names you specify.

### **[ -node {<nodename>|local} ] - Node**

Displays information only about the storage shelves that are attached to the node you specify.

### **[ -shelf-uid <text> ] - Shelf UID**

Displays information only about the storage shelf that matches the shelf UID you specify.

Example: `50:05:0c:c0:02:10:64:26`

### **[ -stack-id {<integer>|-} ] - Stack ID**

Displays information only about the storage shelves that are attached to the stack that matches the stack ID you specify

**[-shelf-id <text>] - Shelf ID**

Displays information only about the storage shelves that match the shelf ID you specify.

**[-module-type****{unknown|atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e|iom12f|nsm100|nsm8e|psm3e|iom12b|iom12g}] - Shelf Module Type**

Displays information only about the storage shelves that match the module-type you specify.

**[-connection-type {unknown|fc|sas|nvme}] - Shelf Connection Type**

Displays information only about the storage shelves that match the connection type you specify.

Example: FC or SAS.

**[-is-local-attach {true|false}] - Is the Shelf Local to This Cluster?**

Displays information only about the storage shelves that are local (TRUE) or remote (FALSE) to this cluster.

**[-vendor <text>] - Shelf Vendor**

Displays information only about the storage shelves that match the vendor you specify.

**[-product-id <text>] - Shelf Product Identification**

Displays information only about the storage shelves that match the product ID you specify.

**[-serial-number <text>] - Shelf Serial Number**

Displays information only about the storage shelf that matches the serial number you specify.

**[-disk-count {<integer>|-}] - Disk Count**

Displays information only about the storage shelves that have the disk count you specify.

**[-state {unknown|no-status|init-required|online|offline|missing}] - Shelf State**

Displays information only about the storage shelves that are in the state you specify.

**[-op-status {unknown|normal|warning|error|critical|standby-power}] - Shelf Operational Status**

Displays information only about the storage shelves that are currently operating under the status condition you specify.

**[-bay-id {<integer>|-}] - Bay ID**

Displays information only about the storage shelves that have bays that match the bay ID you specify.

**[-bay-type {unknown|single-disk|multi-lun}] - Bay Type**

Displays information only about the storage shelves that have bays that match the type of bay you specify.

**[-bay-has-disk {true|false}] - Bay Has Disk**

Displays information only about the storage shelves that have bays with disk drives inserted in them (true) or empty bays (false).

**[-bay-op-status {unknown|normal|error}] - Bay Operational Status**

Displays information only about the storage shelves that have bays that match the operational state you specify.

**[-controller {<nodename>|local}] - Controller Name**

Displays information only about the storage shelves that are connected to the node you specify.

**[-controller-uuid <text>,...] - Controller UUID**

Displays information only about the storage shelves that are connected to the node UUID you specify.

**[-initiator <text>,...] - Initiator**

Displays information only about the storage shelves that are visible to the initiator you specify.

**[-initiator-wwpn <text>,...] - Initiator WWPN**

Displays information only about the storage shelves that are visible to the initiator WWPN you specify.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Displays information only about the storage shelves that are visible to an initiator connected to the switch port you specify.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Displays information only about the storage shelves visible on target ports identified by the switch port to which they are connected.

**[-target-port <text>,...] - Target Port**

Displays information only about the storage shelves visible on the specified target ports identified by their World-Wide Port Name (WWPN).

**[-tpgn {<integer>|-}] - Target Port Group Number**

Displays information only about the storage shelves that belong to the Target Port Group Name (TPGN) you specify.

**[-port-speed {<integer>|-}] - Port Speed**

Displays information only about the storage shelves with ports that match the port speed you specify.

**[-io-kbps {<integer>|-}] - Kbytes/sec on Storage Shelf**

Displays information only about the storage shelves visible to an initiator that has executed I/O at the throughput you specify.

**[-iops {<integer>|-}] - Number IOPS per Second on Storage Shelf**

Displays information only about the storage shelves visible to an initiator that has executed the number of IOPs you specify.

**[-current-sensor-id {<integer>|-}] - Current Sensor ID**

Displays information only about the storage shelves with current sensor that matches the current sensor ID you specify.

**[-current-sensor-location <text>,...] - Current Sensor Location**

Displays information only about the storage shelves with current sensors installed at the location you specify.

**[-current-sensor-reading {<integer>|-}] - Current Sensor Reading**

Displays information only about the storage shelves with current sensors that match the current reading you specify.

**[-current-op-status {unknown|normal|over-current-critical|under-current-critical|not-supported|not-installed}] - Operational Status**

Displays information only about the storage shelves with current sensors that match the operational status you specify.

**[-fan-id {<integer>|-}] - Fan ID**

Displays information only about the storage shelves with cooling fans that match the fan IDs you specify.

**[-fan-location <text>,...] - Fan Location**

Displays information only about the storage shelves with cooling fans installed.

**[-fan-rpm {<integer>|-}] - Fan Rotation Per Minute**

Displays information only about the storage shelves with cooling fans that match the rpm rate you specify.

**[-fan-op-status {unknown|normal|off|error|not-supported|not-installed}] - Fan Operational Status**

Displays information only about the storage shelves with cooling fans that match the operational status you specify.

**[-module-id <text>,...] - Module ID**

Displays information only about the storage shelves with an I/O module that matches the module ID you specify.

**[-module-location <text>,...] - Module Location**

Displays information only about the storage shelves with I/O modules in the specified shelf module slots.

**[-module-part-number <text>,...] - Module Part Number**

Displays information only about the storage shelves with I/O modules that match the module part numbers you specify.

**[-is-sas-master-module {true|false}] - Is SAS Expander Master Module?**

Displays information only about the storage shelves with a SAS master I/O module (true) or an I/O module that is not a SAS master (false). This parameter applies only to SAS shelves.

**[-is-monitor-active {true|false}] - Is Monitor Active?**

Displays information only about the storage shelves whose monitoring is enabled (true) or disabled (false).

**[-enclosure-type <text>,...] - Module Enclosure Type**

Displays information only about the storage shelves that match the enclosure types you specify.

**[-es-serial-number <text>,...] - ES Electronics Element Serial Number**

Displays information only about the storage shelves with I/O modules that match the electronics serial numbers you specify.

**[-module-fru-id <text>,...] - Field Replaceable Unit ID**

Displays information only about the storage shelves with I/O modules that match the field replaceable unit (FRU) IDs you specify.

**[-module-is-reporting-element {true|false}] - Is Reporting Element?**

Displays information only about the storage shelves with element reporting I/O modules (true) or not (false).

**[-module-fw-revision <text>,...] - Firmware Revision**

Displays information only about the storage shelves with I/O modules that match the firmware revision you specify.

**[-module-latest-fw-revision <text>,...] - Latest Firmware Revision**

Displays information only about the storage shelves with I/O modules that match the latest firmware revision you specify.

**[-module-fw-progress {not-available|ready|in-progress|failed}] - Module Firmware Progress**

Displays information only about the storage shelves with I/O modules that match the specified firmware update progress.

**[-module-swap-count {<integer>|-}] - Module Swap Count**

Displays information only about the storage shelves whose I/O modules have been swapped the specified number of times.

**[-module-op-status {unknown|normal|warning|error|not-installed}] - Module Operational Status**

Displays information only about the storage shelves with I/O modules that match the operational status you specify.

**[-sas-port-id <text>,...] - Port ID**

Displays information only about the storage shelves with SAS Ports that match the port IDs you specify.

**[-sas-port-type****{unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi\_ho|a\_to\_b|b\_to\_a}] - Port Type**

Displays information only about the storage shelves with SAS Ports that match the SAS port type

you specify.

### **[-sas-port-wwpn <text>, ...] - Port World Wide Port Name**

Displays information only about the storage shelves with SAS Ports that match the World-Wide Port Names you specify.

### **[-sas-port-speed <text>, ...] - Port Speed**

Displays information only about the storage shelves with SAS Ports that match the port speed you specify.

### **[-sas-negotiated-port-speed <text>, ...] - Negotiated Port Speed**

Displays information only about the storage shelves with SAS Ports that match the negotiated port speed you specify.

### **[-sas-port-power-status <text>, ...] - Port Power Status**

Displays information only about the storage shelves with SAS Ports that match the power status you specify.

### **[-sas-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp\_clk\_thr|byp\_comma\_los|byp\_crc\_brst\_thr|byp\_data\_timeout|byp\_drv\_fault|byp\_drv\_pcycle|byp\_drv\_pwr|byp\_drv\_self|byp\_gen|byp\_init|byp\_lip\_brst\_thr|byp\_lip\_f8|byp\_lip\_rate\_thr|byp\_lipf7|byp\_ltbi|byp\_man|byp\_no\_drive|byp\_osc|byp\_other\_thr|byp\_rec\_los|byp\_rport|byp\_stall\_thr|byp\_wrd\_brst\_thr|byp\_wrd\_rate\_thr|byp\_xmit\_fault|diag\_transmit|inserted|loopback|status\_unknown|warn\_high\_clk\_delta|warn\_high\_crc\_rate|warn\_high\_lip|warn\_high\_wrd\_rate|term|phy\_dis\_clk\_fault|phy\_dis\_crc\_err|phy\_dis\_crc\_err\_burst|phy\_dis\_disparity|phy\_dis\_disparity\_burst|phy\_dis\_emulate\_reserve|phy\_dis\_inval\_dword|phy\_dis\_inval\_dword\_burst|phy\_dis\_loss\_dword|phy\_dis\_loss\_dword\_burst|phy\_dis\_man\_smp|phy\_dis\_manual|phy\_dis\_mirrored|empty|phy\_dis\_phy\_change|phy\_dis\_phy\_change\_burst|phy\_dis\_phy\_reset|phy\_dis\_phy\_reset\_burst|phy\_dis\_phy\_unused|phy\_ena|phy\_ena\_not\_attach|phy\_ena\_unknown|phy\_unknown|phy\_dis\_illegal}] - Port Operational Status**

Displays information only about the storage shelves with SAS Ports that match the operational status you specify.

### **[-sas-port-module-id {A|B}] - Port Module ID**

Displays information only about the storage shelves with SAS Ports that match the module ID you specify.

### **[-fc-port-id <text>, ...] - Fibre Channel Port ID**

Displays information only about the storage shelves with FC Ports that match the port IDs you specify.

### **[-fc-port-mode**

### **{unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi\_ho|a\_to\_b|b\_to\_a}] - Fibre Channel Port Mode**

Displays information only about the storage shelves with FC Ports that match the port modes you specify.

**[-fc-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp\_clk\_thr|byp\_comma\_los|byp\_crc\_brst\_thr|byp\_data\_timeout|byp\_drv\_fault|byp\_drv\_pcycle|byp\_drv\_pwr|byp\_drv\_self|byp\_gen|byp\_init|byp\_lip\_brst\_thr|byp\_lip\_f8|byp\_lip\_rate\_thr|byp\_lipf7|byp\_ltbi|byp\_man|byp\_no\_drive|byp\_osc|byp\_other\_thr|byp\_rec\_los|byp\_rport|byp\_stall\_thr|byp\_wrd\_brst\_thr|byp\_wrd\_rate\_thr|byp\_xmit\_fault|diag\_transmit|inserted|loopback|status\_unknown|warn\_high\_clk\_delta|warn\_high\_crc\_rate|warn\_high\_lip|warn\_high\_wrd\_rate|term|phy\_dis\_clk\_fault|phy\_dis\_crc\_err|phy\_dis\_crc\_err\_burst|phy\_dis\_disparity|phy\_dis\_disparity\_burst|phy\_dis\_emulate\_reserve|phy\_dis\_inval\_dword|phy\_dis\_inval\_dword\_burst|phy\_dis\_loss\_dword|phy\_dis\_loss\_dword\_burst|phy\_dis\_man\_smp|phy\_dis\_manual|phy\_dis\_mirrored|empty|phy\_dis\_phy\_change|phy\_dis\_phy\_change\_burst|phy\_dis\_phy\_reset|phy\_dis\_phy\_reset\_burst|phy\_dis\_phy\_unused|phy\_ena|phy\_ena\_not\_attach|phy\_ena\_unknown|phy\_unknown|phy\_dis\_illegal}] - Fibre Channel Port Operational Status**

Displays information only about the storage shelves with FC Ports that match the operational status you specify.

**[-psu-id {<integer>|-}] - Power Supply Unit ID**

Displays information only about the storage shelves with power supply units (PSU) that match the unit IDs you specify.

**[-psu-location <text>, ...] - Power Supply Unit Location**

Displays information only about the storage shelves with PSUs that are located at the specified location inside the shelf.

**[-psu-type <text>, ...] - Power Supply Unit Type**

Displays information only about the storage shelves with PSUs that match the PSU types you specify.

**[-psu-part-number <text>, ...] - Power Supply Unit Part Number**

Displays information only about the storage shelves with PSUs that match the PSU part number you specify.

**[-psu-serial-number <text>, ...] - Power Supply Unit Serial Number**

Displays information only about the storage shelves with PSUs that match the PSU serial numbers you specify.

**[-psu-reset-capable {true|false}] - Power Supply Unit Reset Capability**

Displays information only about the storage shelves with reset capable PSUs (true) or reset incapable PSUs (false).

**[-psu-is-enabled {true|false}] - Power Supply Unit Enable/Disable Status**

Displays information only about the storage shelves with PSUs that are enabled (true) or disabled (false).

**[-psu-fw-version <text>, ...] - Power Supply Unit Firmware Version**

Displays information only about the storage shelves with PSUs that have the firmware version you specify.

**[-psu-op-status {unknown|normal|error|dc-over-voltage|dc-under-voltage|dc-over-current|over-temperature-error|failed|off|not-supported|not-installed}] - Operational Status**

Displays information only about the storage shelves with PSUs that match the operational status you specify.

**[-psu-power-rating {<integer>|-}] - Power Supply Power Ratings In Watts**

Displays information only about the storage shelves with PSUs that match the power rating you specify.

**[-psu-crest-factor {<integer>|-}] - Power Supply Crest Factor**

Displays information only about the storage shelves with PSUs that match the crest factor value you specify.

**[-psu-power-drawn {<integer>|-}] - Power Drawn From PSU In Watts**

Displays information only about the storage shelves with PSUs that match the drawn power you specify.

**[-temp-sensor-id {<integer>|-}] - Sensor Name**

Displays information only about the storage shelves with temperature sensors that match the sensor IDs you specify.

**[-temp-sensor-location <text>,...] - Sensor Location**

Displays information only about the storage shelves with temperature sensors that match the specified sensor locations inside the shelf.

**[-temp-sensor-reading {<integer>|-}] - Temperature Reading**

Displays information only about the storage shelves with temperature sensors that match the temperature reading you specify.

**[-temp-is-ambient {true|false}] - Temperature Reading at Ambient Value**

Displays information only about the storage shelves with temperature sensors whose current temperature reading is ambient (true) or not (false).

**[-temp-high-critical-threshold {<integer>|-}] - High Critical Threshold**

Displays information only about the storage shelves with temperature sensors that match the high critical threshold you specify.

**[-temp-high-warning-threshold {<integer>|-}] - High Warning Threshold**

Displays information only about the storage shelves with temperature sensors that match the high warning threshold you specify.

**[-temp-low-warning-threshold {<integer>|-}] - Low Warning Threshold**

Displays information only about the storage shelves with temperature sensors that match the low warning threshold you specify.

**[-temp-low-critical-threshold {<integer>|-}] - Low Critical Threshold**

Displays information only about the storage shelves with temperature sensors that match the low

critical threshold you specify.

**[-temp-op-status {unknown|normal|under-temperature|over-temperature|error|not-supported|not-installed}] - Operational Status**

Displays information only about the storage shelves with temperature sensors that match the operational status you specify.

**[-voltage-sensor-id {<integer>|-}] - Voltage Sensor ID**

Displays information only about the storage shelves with voltage sensors that match the sensor IDs you specify.

**[-voltage-sensor-location <text>,...] - Voltage Sensor Location**

Displays information only about the storage shelves with voltage sensors that match the specified sensor locations inside the shelf.

**[-voltage-sensor-reading <text>,...] - Voltage Current Reading**

Displays information only about the storage shelves with voltage sensors that match the voltage reading you specify.

**[-voltage-op-status {unknown|normal|over-voltage-critical|under-voltage-critical|not-supported|not-installed|not-recoverable}] - Operational Status**

Displays information only about the storage shelves with voltage sensors that match the operational status you specify.

**[-nsm-port-module-id {A|B}] - Port Module ID**

Displays information only about the storage shelves with PCIe Ports from the specified module.

**[-nsm-port-id <integer>,...] - Port ID**

Displays information only about the storage shelves with PCIe Ports that match the specified ID.

**[-nsm-port-type {cpu|disk|cx5|ethernet}] - Port Type**

Displays information only about the storage shelves with PCIe Ports that match the specified type.

**[-nsm-port-state {ok|off-link-disabled|off-dll-link|link-down|no-drive}] - Port State**

Displays information only about the storage shelves with PCIe Ports that match the specified state.

**[-nsm-port-bay <integer>,...] - Port Bay**

Displays information only about the storage shelves with PCIe Ports that match the specified bay.

**[-nsm-port-disk-id <integer>,...] - Port Disk ID**

Displays information only about the storage shelves with PCIe Ports that match the specified disk ID.

**[-nsm-port-is-installed {true|false}] - Port Is Disk Installed**

Displays information only about the storage shelves with PCIe Ports that have a disk installed.

**[-nsm-port-is-error {true|false}] - Port Has Error**

Displays information only about the storage shelves with PCIe Ports that have errors.

**[-nsm-port-speed {2.5|5.0|8.0}] - Port Speed**

Displays information only about the storage shelves with PCIe Ports that match the specified speed.

**[-nsm-port-speed-max {2.5|5.0|8.0}] - Max Port Speed**

Displays information only about the storage shelves with PCIe Ports that match the specified maximum speed.

**[-nsm-port-lane-width <integer>,...] - Port Lane Width**

Displays information only about the storage shelves with PCIe Ports that match the specified lane width.

**[-nsm-port-lane-width-max <integer>,...] - Max Port Lane Width**

Displays information only about the storage shelves with PCIe Ports that match the specified maximum lane width.

**[-dimm-module-id {A|B}] - DIMM Module ID**

Displays information only about the storage shelves with DIMMs from the specified module.

**[-dimm-id <integer>,...] - DIMM ID**

Displays information only about the storage shelves with DIMMs that match the specified ID.

**[-dimm-serial-number <text>,...] - DIMM Serial Number**

Displays information only about the storage shelves with DIMMs that match the specified serial number.

**[-dimm-part-number <text>,...] - DIMM Part Number**

Displays information only about the storage shelves with DIMMs that match the specified part number.

**[-dimm-vendor <text>,...] - DIMM Vendor**

Displays information only about the storage shelves with DIMMs that match the specified vendor.

**[-dimm-type <text>,...] - DIMM Type**

Displays information only about the storage shelves with DIMMs that match the specified type.

**[-dimm-size <text>,...] - DIMM Size**

Displays information only about the storage shelves with DIMMs that match the specified size.

**[-dimm-speed <text>,...] - DIMM Speed**

Displays information only about the storage shelves with DIMMs that match the specified speed.

**[-dimm-location <text>,...] - DIMM Location**

Displays information only about the storage shelves with DIMMs that match the specified location.

**[-dimm-op-status {unknown|normal|error|not-supported|not-installed}] - DIMM Operational Status**

Displays information only about the storage shelves with DIMMs that match the specified operational status.

**[-boot-device-module-id {A|B}] - Boot Device Module ID**

Displays information only about the storage shelves with boot devices from the specified module.

**[-boot-device-id <integer>,...] - Boot Device ID**

Displays information only about the storage shelves with boot devices that match the specified ID.

**[-boot-device-serial-number <text>,...] - Boot Device Serial Number**

Displays information only about the storage shelves with boot devices that match the specified serial number.

**[-boot-device-part-number <text>,...] - Boot Device Part Number**

Displays information only about the storage shelves with boot devices that match the specified part number.

**[-boot-device-vendor <text>,...] - Boot Device Vendor**

Displays information only about the storage shelves with boot devices that match the specified vendor.

**[-boot-device-type <text>,...] - Boot Device Type**

Displays information only about the storage shelves with boot devices that match the specified type.

**[-boot-device-size <text>,...] - Boot Device Size**

Displays information only about the storage shelves with boot devices that match the specified size.

**[-boot-device-op-status {unknown|normal|error|not-supported|not-installed}] - Boot Device Operational Status**

Displays information only about the storage shelves with boot devices that match the specified operational status.

**[-coin-battery-module-id {A|B}] - Coin Battery Module ID**

Displays information only about the storage shelves with coin batteries from the specified module.

**[-coin-battery-id <integer>,...] - Coin Battery ID**

Displays information only about the storage shelves with coin batteries that match the specified ID.

**[-coin-battery-voltage <integer>,...] - Coin Battery Voltage (mV)**

Displays information only about the storage shelves with coin batteries that match the specified voltage.

## **[-coin-battery-op-status {unknown|normal|error|low|high|not-supported|not-installed}] - Coin Battery Operational Status**

Displays information only about the storage shelves with coin batteries that match the specified operational status.

## **[-error-type**

**{Unknown|ACPP|Bootdevice|Coinbattery|Configuration|Current|Dimm|Expander|Fan|Module|PCM|Power|Temperature|Voltage}] - Error Type**

Displays information only about the storage shelves with errors that match the error type you specify.

## **[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

Displays information only about the storage shelves with errors that match the error severity you specify.

## Examples

The following example displays information about all storage shelves:

```
cluster1::> storage shelf show
Module Operational
      Shelf Name  Shelf ID  Serial Number  Model  Type  Status
-----
          1.1      1  6000832415    DS2246  IOM6  Critical
          1.2      2  6000647652    DS2246  IOM6  Normal
          1.3      3  6000003844    DS2246  IOM6  Normal
          1.4      4  SHJ000000013A9E  DS4246  IOM6  Normal
          1.5      5  SHJ000000013A84  DS4246  IOM6  Normal
          1.6      6  6000005555    DS2246  IOM6  Normal

6 entries were displayed.
cluster1::>
```

The following example displays expanded information about a storage shelf named 1.2:

```
cluster1::> storage shelf show -shelf 1.2 -instance
Shelf Name: 1.2
      Stack ID: 1
      Shelf ID: 2
      Shelf UID: 50:0a:09:80:01:b9:75:41
      Serial Number: 6000647652
      Module Type: IOM6
      Model: DS2246
      Shelf Vendor: NETAPP
      Disk Count: 12
      Connection Type: SAS
      Shelf State: Online
      Status: Normal
```

Modules:

Latest Swap Operational Module		Module is		Monitor	Is	Reporting	FW Update
ID	Part No.	ES	Serial No.	is Active	Master Element	Progress	FW Rev.

The following example displays error information about the storage shelves that have errors:

```

cluster1::> storage shelf show -errors
Shelf Name: 1.1
      Shelf UID: 50:0a:09:80:01:cb:d6:84
      Serial Number: 6000832415
Error Type      Description
-----
Power          Critical condition is detected in storage shelf power supply
unit "1". The unit might fail.
Temperature    Critical over temperature failure for temperature sensor "1".
Current temperature: "75" C ("167" F).

```

## storage shelf acp configure

Configure alternate control path (ACP)

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Configure the ACP connectivity on the cluster.

## Parameters

### **-is-enabled {true|false} - Is Enabled?**

Configures the connectivity to the specified state.

### **[-subnet <IP Address>] - Subnet**

Configures the connectivity to the specified subnet.

### **[-netmask <IP Address>] - Netmask**

Configures the connectivity to the specified netmask.

### **[-channel {out-of-band|in-band}] - Channel**

Configures the connectivity to the specified channel.

## Examples

The following example configures out-of-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel out-of-band -subnet 192.168.0.1 -netmask 255.255.255.0
```

The following example configures in-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel in-band
```

The following example disables ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled false
```

## storage shelf acp show

Show connectivity information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Displays information about the ACP connectivity on each node

## Parameters

### **{ [-fields <fieldname>, ... ]**

If you specify the `-fields <field-name>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **[ [-errors ]**

If you specify the `-errors` parameter, the command displays detailed information about all modules with errors.

### **[ [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value.

### **[-is-enabled {true|false}] - Is Enabled?**

Selects the nodes that are enabled or disabled.

### **[-port <text>] - Port**

Selects the nodes that match the specified port on which ACP is configured.

### **[-address <IP Address>] - IP Address**

Selects the nodes with the specified IP address.

### **[-subnet <IP Address>] - Subnet**

Selects the nodes with the specified subnet.

### **[-netmask <IP Address>] - Netmask**

Selects the nodes with the specified netmask.

### **[-connection-status {no-connectivity|partial-connectivity|full-connectivity|additional-connectivity|unknown-connectivity|not-available|connection-disabled}] - Connection Status**

Selects the nodes with the specified connection status.

### **[-error-id <integer>] - Error ID**

Selects the node with the specified error ID.

### **[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}] - Error Type**

The error type, in case of a connection error.

### **[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

The error severity, in case of a connection error.

**[-error-text <text>] - Error Text**

Selects the node with the specified error text.

**[-corrective-action <text>] - Corrective Action**

Selects the node with the specified corrective action.

**[-channel {unknown|out-of-band|in-band}] - Channel**

Selects the nodes that has channel configured out-of-band or in-band.

## Examples

The following example displays ACP connectivity on each node (in-band):

```
fas2750-2n-rtp-1::> storage shelf acp show
Node           Channel           Connectivity
-----
fas2750-rtp-1a  in-band           active
fas2750-rtp-1b  in-band           active
2 entries were displayed.
```

The following example displays ACP connectivity on each node (out of band):

```
fas2750-2n-rtp-1::> storage shelf acp show
Node           Channel           Connectivity
-----
fas2750-rtp-1a  out-of-band       full-connectivity
fas2750-rtp-1b  out-of-band       full-connectivity
2 entries were displayed.
```

The following example displays the -instance output of the storage acp show (in-band) command. Use this command to display details on connectivity and configuration.

```
fas2750-2n-rtp-1::> storage shelf acp show -instance
Node: fas2750-rtp-1a
Channel: in-band
Enable Status: true
Connection Status: active
Node: fas2750-rtp-1b
Channel: in-band
Enable Status: true
Connection Status: active
2 entries were displayed.
```

The following example displays the -instance output of the storage acp show (out-of-band) command. Use this command to display details on connectivity and configuration.

```
fas2750-2n-rtp-1::> storage shelf acp show -instance
  Node: fas2750-rtp-1a
    Channel: out-of-band
  Enable Status: true
  Port: e0P
  IP Address: 192.168.1.74
    Subnet: 192.168.0.1
    Netmask: 255.255.252.0
  Connection Status: full-connectivity
Node: fas2750-rtp-1b
  Channel: out-of-band
  Enable Status: true
  Port: e0P
  IP Address: 192.168.1.75
    Subnet: 192.168.0.1
    Netmask: 255.255.252.0
  Connection Status: full-connectivity
2 entries were displayed.
```

## storage shelf acp module show

Show modules connected to the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays information about the modules connected to each node

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the `-fields <field-name>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify

**[ [-errors ] ]**

If you specify the `-errors` parameter, the command displays detailed information about all modules with errors.

**[ [-instance ] ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the modules that match this parameter value.

**[-mac-address <text>] - MAC Address**

Selects the module that match the specified MAC address.

**[-module-name <text>] - Module name**

Selects the module that match the specified module name.

**[-module-address <IP Address>] - IP Address**

Selects the module that match the specified IP address.

**[-protocol-version <text>] - Protocol Version**

Selects the modules that match the specified protocol version.

**[-firmware-version <text>] - Firmware Version**

Selects the modules that match the specified firmware version.

**[-acpa-id <integer>] - ACPA assigner ID**

Selects the modules that match the specified ACPA ID.

**[-shelf-serial-number <text>] - Shelf Serial Number**

Selects the modules that match the specified shelf serial number.

**[-iom-type {Unknown|iom3|iom6|iom6e|iom12|iom12e|iom12f|iom12b}] - IOM Type**

Selects the modules that match the specified IOM type (IOM3/IOM6/IOM6E).

**[-last-contact <integer>] - Last Contact (secs)**

Selects the modules that match the specified last contact.

**[-state {unknown|initializing|discovery-complete|awaiting-inband|no-inband|active|awaiting-bootp|updating-firmware|connection-error|firmware-update-required|rebooting|fail|unsupported|degraded|shelf-off}] - Local Node State**

Selects the modules that match the specified state.

**[-stack-id {<integer>|-}] - Stack ID**

Selects the modules that match the specified stack ID.

**[-shelf-id <text>] - Shelf ID**

Selects the modules that match the specified shelf ID.

**[-adapter-name <text>] - Adapter Name**

Selects the modules that match the specified adapter name.

**[-error-id <integer>, ...] - Error ID**

Selects the modules that match the specified error ID.

**[-error-text <text>, ...] - Error Text**

The error text, in case of a module error.

**[-corrective-action <text>,...] - Corrective Action**

The corrective action, in case of a module error.

**[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}] - Error Type**

Selects the modules that match the specified error type.

**[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

Selects the modules that match the specified error severity.

**[-power-cycle-count <integer>] - Power Cycle count**

Number of times a shelf power cycle has been performed on a shelf

**[-power-off-count <integer>] - Power Off count**

Number of times a shelf power off has been performed on a shelf

**[-power-on-count <integer>] - Power On count**

Number of times a shelf power on has been performed on a shelf

**[-expander-reset-count <integer>] - Expander reset count**

Number of times an expander reset has been performed on a module

**[-expander-power-cycle-count <integer>] - Expander power cycle count**

Number of times an expander power cycle has been performed on a module

## Examples

The following example displays the ACP modules connected to each node:

```
cluster1::> storage shelf acp module show
Node           Module Name      State
-----
stor-v4-1a-1b-01  1.10.A           Active
                  1.10.B           Active
                  1.254.B          Active
                  1.254.A          Active

stor-v4-1a-1b-02  1.10.A           Active
                  1.10.B           Active
                  1.254.B          Active
                  1.254.A          Active

8 entries were displayed.
```

The following example displays the -instance output of the storage shelf acp module show. More details on each module can be seen [here](#).

```
cluster1::> storage shelf acp module show -instance
```

```

## storage shelf drawer show-phy

Display a list of PHYs per drawer

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage shelf drawer show-phy** command displays information for drawer PHYs in the storage system. If no parameters are specified, the default command displays the following information about PHYs:

- Shelf Name
- Drawer Number
- PHY Number
- Type
- SAS Address
- State

To display detailed information about a single PHY, use the **-shelf**, **-drawer**, and **-phy** parameters.

### Parameters

**{ [-fields <fieldname>, ...]**

Displays the specified fields for all drawer PHYs, in column style output.

**l [-instance ]**

Displays expanded information for all drawer PHYs in the system. If a shelf, drawer, and PHY are specified, then this parameter displays the same detailed information for the PHY you specify as does the -shelf, -drawer, and -phy parameters.

**[-shelf <text>] - Shelf Name**

Displays the PHYs in the storage shelf that matches the specified shelf name.

**[-drawer <integer>] - Drawer Number**

Displays the PHYs in the drawers that match the specified drawer number.

**[-phy <integer>] - PHY Number**

Displays the PHYs that match the specified PHY number.

**[-node {<nodename>|local}] - Node Name**

Displays the PHYs that are present for the specified node.

**[-type {unknown|disk|virtual|input}] - Type**

Displays the PHYs with the specified type.

**[-physical-id <integer>] - Physical ID**

Displays the PHYs that match the specified physical-id.

**[-sas-address <text>] - Attached SAS Address**

Displays the PHYs with the specified attached sas address.

**[-state-a {unknown|enabled|disabled}] - State Module A**

Displays the PHYs for which module A has the specified state.

**[-state-b {unknown|enabled|disabled}] - State Module B**

Displays the PHYs for which module B has the specified state.

**[-status-a <Drawer PHY Status>] - Status Module A**

Displays the PHYs with module A currently operating under the specified status.

**[-status-b <Drawer PHY Status>] - Status Module B**

Displays the PHYs with module B currently operating under the specified status.

## Examples

The following example displays information about all drawer PHYs:

```
cluster1::> storage shelf drawer show-phy
Shelf Drawer PHY # Type SAS Address PHY State A/B
```

## storage shelf drawer show-slot

Display a map between bay number and drawer/slot number

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage shelf drawer show-slot** command maps each drawer and slot number to the corresponding bay number.

### Parameters

**{ [-fields <fieldname>, ... ]**

Displays the specified fields in column style output.

**[ [-instance ]**

Displays all slot information.

**[-shelf <text>] - Shelf Name**

Displays the slots in the shelf that matches the specified shelf name.

**[-bay <integer>] - Bay Number**

Displays the slots that have the specified bay number.

**[-node {<nodename>|local}] - Node Name**

Displays the slots that are present for the specified node.

**[-drawer <integer>] - Drawer Number**

Displays the slots in the drawers that match the specified drawer number.

**[-slot <integer>] - Slot Number**

Displays the slots that match the specified slot number.

**[-is-installed {yes|no}] - Is Disk Installed**

Displays the slots that have a disk installed.

## Examples

The following example displays the mapping from drawer and slot number to bay number:

```
cluster1::> storage shelf drawer show-slot
Shelf  Drawer  Slot  Bay  Installed?

## storage shelf drawer show

Display a list of drawers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage shelf drawer show** command displays information for storage shelf drawers in the storage system. If no parameters are specified, the default command displays the following information for the drawers:

- Shelf Name
- Drawer Number
- Status
- Closed/Open
- Disk Count
- Firmware

To display detailed information for a single drawer, use the **-shelf** and **-drawer** parameters.

## Parameters

**{ [-fields <fieldname>, ... ]**

Displays the specified fields for all drawers, in column style output.

**! [-errors ]**

Displays the following error status information about the drawers that have errors:

- Status
- Error Description

**! [-instance ]**

Displays expanded information for all drawers in the system. If a shelf and drawer are specified, then this parameter displays the same detailed information for the specified drawer as does the -shelf and -drawer parameters.

**[-shelf <text>] - Shelf Name**

Displays the drawers in the storage shelf that matches the specified shelf name.

**[-drawer <integer>] - Drawer Number**

Displays the drawers that match the specified drawer number.

**[-node {<nodename>|local}] - Node Name**

Displays the drawers that are present for the specified node.

**[-disk-count <integer>] - Drawer Disk Count**

Displays the drawers that have the specified disk count.

**[-part-number <text>] - Part Number**

Displays the drawers that have the specified part number.

**[-serial-number <text>] - Serial Number**

Displays the drawer that matches the specified serial number.

**[-is-closed {open|closed}] - Drawer is Closed?**

Displays the drawers that are closed or open.

**[-firmware-a <text>] - Firmware A**

Displays the the drawers for which module A has the specified firmware version.

**[-firmware-b <text>] - Firmware B**

Displays the drawers for which module B has the specified firmware version.

**[-path-a {unknown|ok|degraded|none}] - Path A**

Displays the drawers for which module A has the specified path status.

**[-path-b {unknown|ok|degraded|none}] - Path B**

Displays about drawers for which module B has the specified path status.

**[-is-supported {yes|no}] - Drawer is Supported?**

Displays the drawers that are supported (TRUE) or not supported (FALSE).

**[-vendor <text>] - Vendor Name**

Displays the drawers that match the specified vendor.

**[-mfg-date <text>] - Mfg. Date**

Displays the drawers that match the specified manufactured date.

**[-fru-type <text>] - FRU Type**

Displays the drawers that match the specified FRU type.

**[-status-a {unknown|normal|warning|error|critical}] - Status A**

Displays the drawers with module A currently operating under the specified status.

**[-status-b {unknown|normal|warning|error|critical}] - Status B**

Displays the drawers with module B currently operating under the specified status.

**[-error <text>] - Error**

Displays the drawers that match the specified error description.

## Examples

The following example displays information about all drawers:

```
cluster1::> storage shelf drawer show
Drawer  Disk
Shelf  Drawer  Status A/B  Closed? Count  Firmware A/B
-----
2.5
      1  normal/normal  closed    4  00000634/00000634
      2  normal/normal  closed    4  00000634/00000634
      3  normal/normal  closed    4  00000634/00000634
      4  normal/normal  closed    5  00000634/00000634
      5  normal/normal  closed    4  00000634/00000634
5 entries were displayed.
cluster1::>
```

The following example displays expanded information about drawer 1 in shelf 2.5:

```
cluster1::> storage shelf drawer show -shelf 2.5 -drawer 1
Shelf: 2.5
      Drawer ID: 1
      Part Number: 111-03071
      Serial Number: 021604008153
      Drawer is Closed?: closed
      Disk Count: 4
```

```

    Firmware A: 00000634
    Firmware B: 00000634
      Path A: ok
      Path B: ok
    Status A: normal
    Status B: normal
Drawer is Supported?: yes
  Vendor Name: NETAPP
    Mfg. Date: 02/2016
    FRU Type: SASDRWR
  Error Description: -
cluster1::>

```

The following example displays error information about the drawers that have errors:

```

cluster1::> storage shelf drawer show -errors
Shelf Drawer   Status A/B   Error Description
-----
    2.5
          2 warning/warning Drawer open.
cluster1::>

```

## storage shelf firmware show-update-status

Display the Shelf Firmware Update (SFU) Status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **storage shelf firmware show-update-status** command displays the state of the Shelf Firmware Update process.

### Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the node that matches this parameter value.

**[-update-status {running|idle}] - Disk Shelf Firmware Update Status**

Selects the nodes whose SFU process status matches this parameter value. Possible values are:

- running - Disk shelf firmware update is in progress.
- idle - Disk shelf firmware update is not in progress.

**[-in-progress-count <integer>] - Number of Shelves with Earlier Revisions Being Updated**

Selects the nodes that matches the number of shelves the SFU process is updating to this parameter value. This specifies the number of shelves with earlier revisions that are being updated.

## Examples

```
cluster1::*> storage shelf firmware show-update-status
          Update In-Progress
Node      Status      Count
-----
cluster-n1  running      10
cluster-n2  idle          -
cluster-n3  running       7
```

# storage shelf firmware update

## Update Shelf Firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage shelf firmware update** command updates the firmware on one or more shelves. You can download the latest firmware by using the [storage firmware download](#) command. You can specify a shelf whose firmware is to be updated by using the **-shelf** parameter. You can update the firmware on all the shelves by not providing the **-shelf** parameter. All the shelves of a specific module type can be updated by providing a value to the **-module-type** parameter.

## Parameters

**{ [-shelf <text>] - Shelf Name**

This specifies the name of the shelf whose firmware is to be updated.

**[-module-type {atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e|iom12b|nsm100|nsm8e|iom12g}] - Shelf Module Type }**

Update the firmware on the shelves that match the module-type you specify.

**[-refresh <true>] - Refresh**

Forces an update on the shelf with the highest revision of the applicable firmware, resulting in a refresh of the firmware image already present on the shelf.

## Examples

The following example updates the firmware on all the shelves in the cluster:

```
cluster1::*> storage shelf firmware update
```

The following example updates the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -module-type IOM6
```

The following example updates the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -shelf 1.2
```

The following example refreshes the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -refresh -module-type IOM6
```

The following example refreshes the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -refresh -shelf 1.2
```

# storage shelf location-led modify

Modify the state of the shelf Location LED

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage shelf location-led modify** command modifies the on/off state of the shelf location LED.

## Parameters

### **-shelf-name <text> - Shelf Name**

This parameter specifies the shelf whose LED is to be turned on or turned off.

### **[-led-status {on|off}] - Location LED**

This parameter specifies whether the shelf location LED needs to be turned on or turned off.

## Examples

The following example turns on the shelf location LED of the specified shelf.

```
cluster1::> storage shelf location-led modify -shelf-name 1.0 -led-status on  
Info: Shelf locate request successful for shelf "1.0".
```

The following example turns off the shelf location LED of the specified shelf.

```
cluster1::> storage shelf location-led modify -shelf-name 1.0 -led-status off  
Info: Shelf locate request successful for shelf "1.0".
```

## storage shelf location-led show

Display the Location LED status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage shelf location-led show** command displays the state of shelf location LED.

## Parameters

### **{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[ -instance ]**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-shelf-name <text>] - Shelf Name**

Selects the shelves whose shelf-name matches this parameter value.

**[-node {<nodename>|local}] - Node Name**

Selects the nodes that match this parameter value.

**[-stack-id <integer>] - Stack ID**

Selects the shelves whose stack-id matches this parameter value.

**[-shelf-id <integer>] - Shelf ID**

Selects the shelves whose shelf-id matches this parameter value.

**[-led-status {on|off}] - Location LED**

Shows the state of the shelf location LED.

## Examples

The following example shows the state of the shelf location LED for each shelf.

```
cluster1::> storage shelf location-led show
Shelf Name Stack ID Shelf ID LED Status
-----
      8.2         8         2 off
      8.3         8         3 off
      6.0         6         0 unsupported
      8.1         8         1 off
4 entries were displayed.
```

## storage shelf port show

Display storage shelf ports

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage shelf port show** command displays information for storage shelf ports in the storage system. If no parameters are specified, the default command displays the following information for the ports:

- Shelf Name
- ID
- Module
- State

- Internal?

To display detailed information for a single port, use the **-shelf** and **-id** parameters.

## Parameters

**{ [-fields <fieldname>, ... ] }**

Displays output in column style about the specified fields for all shelf ports.

**[ -cables ]**

Displays information about all cables connected to the shelf ports.

**[ -instance ]**

Displays expanded information for all shelf ports in the system. If a shelf and ID are specified, then this parameter displays the same detailed information for the specified port as does the **-shelf** and **-id** parameters.

**[ -shelf <text> ] - Shelf Name**

Displays the ports in the storage shelf that matches the specified shelf name.

**[ -id <integer> ] - Port ID**

Displays the ports that match the specified ID.

**[ -node {<nodename>|local} ] - Node Name**

Displays the ports that are present for the specified node.

**[ -module-id {A|B} ] - Module ID**

Displays the ports from the specified shelf module ID.

**[ -is-internal {true|false} ] - Is Port Internal?**

Displays the ports that are internal.

**[ -location <text> ] - Location**

Displays the ports with the specified location.

**[ -is-cable-connected {true|false} ] - Is Cable Connected?**

Displays the ports that have cables connected to them.

**[ -is-error {true|false} ] - Any Errors?**

Displays the ports for which errors have been logged.

**[ -connector-state {connected|disconnected|error} ] - Connector State**

Displays the ports with the specified connector state.

**[ -connector-serial-number <text> ] - Connector Serial Number**

Displays the ports with the specified connector serial number.

**[-connector-type {QSFP|QSFP+|QSFP28|Mini-SAS-HD}] - Connector Type**

Displays the ports with the specified connector type.

**[-cable-vendor <text>] - Cable Vendor**

Displays the ports that are connected to a cable from the specified vendor.

**[-cable-part-number <text>] - Cable Part Number**

Displays the ports that are connected to a cable with the specified part number.

**[-cable-technology {active-copper|passive-copper|optical}] - Cable Technology**

Displays the ports that are connected to a cable with the specified technology.

**[-cable-length <text>] - Cable Length**

Displays the ports that are connected to a cable with the specified length.

**[-cable-id <text>] - Cable ID**

Displays the ports that are connected to a cable with the specified ID.

**[-cable-end {end\_0|end\_1}] - Cable End**

Displays the ports that are connected to a cable with the specified cable end.

**[-designator <text>] - Designator**

Displays the ports with the specified designator.

**[-wwn <text>] - Local Device WWN**

Displays the ports with the specified WorldWide Name (WWN).

**[-remote-wwn <text>] - Remote Device WWN**

Displays the ports connected to the specified remote WorldWide Name (WWN).

**[-remote-phy <text>] - Remote Phy**

Displays the ports connected to the specified remote PHY.

**[-swap-count <integer>] - Swap Count**

Displays the ports with the specified swap count.

**[-mac <MAC Address>] - Local MAC Address**

Displays the ports with the specified MAC address.

**[-remote-mac <MAC Address>] - Remote MAC Address**

Displays the ports connected to the specified MAC address.

**[-remote-port <text>] - Remote Port**

Displays the ports connected to the specified port.

**[-remote-chassis <text>] - Remote Chassis**

Displays the ports connected to the specified chassis.

**[-remote-device <text>] - Remote Device**

Displays the ports connected to the specified device.

**[-vlan-id <integer>] - VLAN ID**

Displays the ports with the specified Virtual LAN (VLAN) ID.

**[-link-state {unknown|online|offline}] - Link State**

Displays the ports with the specified link state.

## Examples

The following example displays information about all shelf ports:

```
cluster1::> storage shelf port show

Shelf ID Module State      Internal?
-----
1.4
   0 A      connected  false
   1 A      connected  false
   2 B      connected  false
   3 B      connected  false
4 entries were displayed.
```

The following example displays expanded information about port 0 in shelf 1.4:

```
cluster1::> storage shelf port show -shelf 1.4 -id 0
Shelf Name: 1.4
      Port ID: 0
      Module ID: A
      Is Port Internal?: false
      Location: rear of the shelf at the top left, on shelf module A
      Is Cable Connected?: true
      Any Errors?: false
      Connector State: connected
Connector Serial Number: 616930439
      Connector Type: qsfp+
      Cable Vendor: Molex Inc.
Cable Part Number: 112-00431+A0
      Cable Technology: passive-copper
      Cable Length: 5m
      Cable ID: 500a0980000b6c3f-50000d1703544b80
      Cable End: end_1
      Designator: sqr
      Local Device WWN: 500A0980000B6C3F
      Remote Device WWN: 50000D1703544B80
      Remote Phy: 12
```

Swap Count: 0

The following example displays information about the cables:

```
cluster1::> storage shelf port show -cables
```

```
Shelf: 1.4
```

ID	Vendor	Part Number	Technology	Length	Type	Serial Number
0	Molex Inc.	112-00431+A0	passive-copper	5m	qsfp+	616930439
1	Molex Inc.	112-00431+A0	passive-copper	5m	qsfp+	616930364
2	Molex Inc.	112-00431+A0	passive-copper	5m	qsfp+	616930452
3	Molex Inc.	112-00431+A0	passive-copper	5m	qsfp+	616930474

4 entries were displayed.

## storage tape offline

Take a tape drive offline

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command takes the specified tape drive offline.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**{ -name <text> - Tape Drive Device Name**

Use this parameter to specify the device name of the tape drive that needs to be taken offline. The format of the device **-name** name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

**{ -device-id <text> - Tape Drive Device ID }**

Use this parameter to specify the device ID of the tape drive that needs to be taken offline.

## Examples

The following example takes the tape drive with device name 'nrst8m' offline. This tape drive is attached to cluster1-01.

```
cluster1::> storage tape offline -node cluster1-01 -name nrst8m
```

## storage tape online

Bring a tape drive online

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command brings a specified tape drive online.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**{ -device-id <text> - Tape Drive Device ID**

Use this parameter to specify the device ID of the tape drive that needs to be brought online.

**| -name <text> - Tape Drive Device Name }**

Use this parameter to specify the device name of the tape drive that needs to be brought online. The format of the device **-name** name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

## Examples

The following example brings the tape drive with device id sw4:2.126L4 attached to the node, cluster1-01, online.

```
cluster1::> storage tape online -node cluster1-01 -device-id sw4:2.126L4
```

# storage tape position

Modify a tape drive cartridge position

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command changes the tape drive cartridge position.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

### **-name <text> - Tape Drive Device Name**

Use this parameter to specify the device name of the tape drive whose cartridge position needs to be changed. The format of the device **-name** includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

### **-operation {weof|fsf|bsf|fsr|bsr|rewind|erase|eom} - Tape Position Operation**

Use this parameter to specify the tape positioning operation. The possible values for **-operation** are:

- weof - Write end-of-file marks
- fsf - Forward space end-of-file marks
- bsf - Backward space end-of-file marks
- fsr - Forward space records
- bsr - Backward space records
- rewind - Rewind the tape
- erase - Erase then entire tape media from current position
- eom - Position the tape at end of data (end of media if full)

### **[-count <integer>] - Count for Positioning**

Use this parameter to specify the count for a tape positioning operation. You can specify this parameter only with the following operations: weof, fsf, bsf, fsr, and bsr. The default value of this parameter is one.

## Examples

The following example specifies a rewind operation on a tape device. Note the `-count` parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst8m -operation rewind
```

The following example specifies an fsf (forward space filemark) operation on a tape device. Note the `-count` parameter specifies 5 forward space filemarks for this operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst1a -operation fsf -count 5
```

The following example specifies an eom (end-of-media) operation on a tape device. The 'eom' positions a tape at end of data (end of media if full). Note the `-count` parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name rst0h -operation eom
```

## storage tape reset

Reset a tape drive

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command resets a specified tape drive.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**-device-id <text> - Tape Drive Device ID**

Use this parameter to specify the device ID of the tape drive is to be reset.

### Examples

The following example resets the tape drive with device ID `sw4:2.126L3` attached to the node, `cluster1-01`.

```
cluster1::> storage tape reset -node cluster1-01 -device-id sw4:2.126L3
```

# storage tape show-errors

Display tape drive errors

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage tape show-errors** command displays error information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Type of device(tape drive)
- Description of the tape drive
- Alias name of the tape drive
- Tape drive errors

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape drives on the specified node.

**[-device-id <text>] - Device ID**

Selects the tape drive with the specified device ID.

**[-device-type <text>] - Device Type**

Selects the devices with the specified type of tape drive.

**[-description <text>] - Description**

Selects the tape drives with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the tape drive with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the tape drive with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the tape drive with the specified serial number.

**[-error <text>] - Tape Drive Error Description**

Selects the tape drives with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the tape drives with the specified initiator port.

## Examples

The following example shows error information for all tape drives attached to cluster1.

```
cluster1::> storage tape show-errors
  Node: node1
  Device ID: 0d.125
  Device Type: tape drive
  Description: Hewlett-Packard LT0-5
  Alias: st0
Errors: hardware error; repair or replace tape drive
Node: node1
  Device ID: 2d.0
  Device Type: tape drive
  Description: IBM LT0-6 ULT3580
  Alias: st2
Errors: -
```

The following example shows error information for tape drive sw4:2.126L1 attached to the node, node1.

```
cluster1::> storage tape show-errors -device-id sw4:2.126L1 -node node1
Node: node1
  Device ID: sw4:2.126L1
  Device Type: tape drive
  Description: Hewlett-Packard LT0-3
  Alias: st3
Errors: -
```

# storage tape show-media-changer

Display information about media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This **storage tape show-media-changer** command displays information about media changers attached to the cluster. By default, this command displays the following information about all media changers:

- Device ID of media changer
- Description of media changer
- World Wide Node Name of media changer
- World Wide Port Name of media changer
- Serial number of media changer
- Media changer errors
- Node to which the media changer is attached
- Initiator port which hosts the media changer
- Alias name of media changer
- Operational state of media changer
- Functional status of media changer

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-device-id <text>] - Device ID**

Selects the media changer with the specified device ID.

**[-node {<nodename>|local}] - Node**

Displays detailed information about media changers on the specified node.

**[-description <text>] - Description**

Selects the media changers with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the media changer with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the media changers with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the media changer with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the media changer with the specified serial number.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type**

Selects the media changers with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the media changers with the specified operational state.

**[-error <text>] - Media Changer Error Description**

Selects the media changers with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the media changers with the specified initiator port.

## Examples

The following example displays information about all media changers attached to the cluster:

```
cluster1::> storage tape show-media-changer
```

```
Media Changer: sw4:10.11L1
```

```
  Description: PX70-TL
```

```
    WWNN: 2:00a:000e11:10b919

cluster1-01	5a	mc1	available	normal

## storage tape show-supported-status

Displays the qualification and supported status of tape drives

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the supported and qualification status of all tape drives recognized by Data ONTAP attached to a node in the cluster. This includes nonqualified tape drives. Such tape drives do not have a Tape Configuration File (TCF) on the storage system. A nonqualified tape drive can be used if the tape drive emulates a qualified tape drive or if the appropriate TCF for the nonqualified tape drive is downloaded from the NetApp Support Site to the storage system.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the tape drives that match this parameter value.

**[-tape-drive <text>] - Tape Drive Name**

Selects the tape drives that match this parameter value.

**[-is-supported {true|false}] - Tape Drive Supported**

Selects the tape drives that match this parameter value.

**[-status <text>] - Supported Status**

Selects the tape drives that match this parameter value.

### Examples

The following example displays support and qualification status of tape drives recognized by Data

ONTAP. The command also identifies tape drives attached to the node that are nonqualified (not supported).

```
cluster1::> storage tape show-supported-status
```

```
Node: Node1
```

Tape Drive	Is Supported	Support Status
sw4:2.126L6	false	Nonqualified tape drive
Hewlett-Packard C1533A	true	Qualified
Hewlett-Packard C1553A	true	Qualified
Hewlett-Packard Ultrium 1	true	Qualified
Sony SDX-300C	true	Qualified
Sony SDX-500C	true	Qualified
StorageTek T9840C	true	Dynamically Qualified
StorageTek T9840D	true	Dynamically Qualified
Tandberg LTO-2 HH	true	Dynamically Qualified

The following example displays support and qualification status of tape drives selected by `[-t]tape-drive`. The command identifies the supported status of the selected tape drive.

```
cluster1::> storage tape show-supported-status -tape-drive "Sony SDX-300C"
```

```
Node: Node1
```

Tape Drives	Is Supported	Support Status
Sony SDX-300C	true	Qualified

## storage tape show-tape-drive

Display information about tape drives

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This **storage tape show-tape-drive** command displays information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Device ID of tape drive
- Description of tape drive
- World Wide Node Name of tape drive
- World Wide Port Name of tape drive
- Serial Number of tape drive
- Tape drive errors
- Node to which the tape drive is attached

- Initiator port which hosts the tape drive
- Alias name of tape drive
- Operational state of tape drive
- Functional status of tape drive

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-device-id <text>] - Device ID**

Selects the tape drive with the specified device ID.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape drives on the specified node.

**[-description <text>] - Description**

Selects the tape drives with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the tape drive with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the tape drive with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the tape drive with the specified serial number.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type**

Selects the tape drives with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the tape drives with the specified operational state.

**[-error <text>] - Tape Drive Error Description**

Selects the tape drives with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the tape drives with the specified initiator port.

**[-resv-type {off|persistent|scsi}] - Reservation type for device**

Selects the tape drives with the specified type.

## Examples

The following example displays information about all tape drives attached to the cluster:

```
cluster1::> storage tape show-tape-drive
Tape Drive: sw4:11.126
  Description: StorageTek T10000C
    WWNN: 5:001:04f000:b39ec8
    WWPN: 5:001:04f000:b39ec9
Serial Number: 576004000041
Errors: -

Paths:
Node          Initiator  Alias  Device State  Status
-----
cluster1-01   2a        st0    ready-write-enabled  normal
Tape Drive: sw4:12.4
  Description: HP LT0-3
    WWNN: 2:001:000e11:10b919
    WWPN: 2:002:000e11:10b919
Serial Number: 1068000371
Errors: -

Paths:
Node          Initiator  Alias  Device State  Status
-----
cluster1-01   0b        st1    ready-write-enabled  normal
```

## storage tape show

Display information about tape drives and media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage tape show** command displays information about tape drives and media changers attached to the cluster. Where it appears in the remainder of this document "device" may refer to either a tape drive or a media changer. By default, this command displays the following information about all tape drives and media changers:

- Node to which the tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Description of the tape drive/media changer
- Type of device: tape drive or media changer
- Functional status of the tape drive/media changer

## Parameters

### { [-fields <fieldname>, ... ]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### [ [-alias ]

Displays the tape drive/media changer alias with the following details:

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Alias name of the tape drive/media changer
- Alias mapping for tape drive/media changer

### [ [-connectivity ]

Displays the connectivity from the node to the tape drive/media changer with the following details:

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Tape drive/media changer description
- Type of device: tape drive or media changer
- Interface type for the tape drive/media changer
- World Wide Node Name of tape drive/media changer
- World Wide Port Name of tape drive/media changer
- Serial Number of tape drive/media changer
- Tape drive/media changer errors
- Initiator port which hosts the tape drive/media changer
- Alias name of the tape drive/media changer
- Operational state of tape drive/media changer
- Functional status of tape drive/media changer

### [ [-device-names ]

Displays the tape drive names for used tape positioning using the following details: rewind, no rewind, unload/reload and density

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Tape drive/media changer description
- Device Names that include Rewind, no Rewind, Unload/Reload

### **[ -status ]**

Displays the status of tape drive/media changer with the following details:

- Device ID of the tape drive/media changer
- Tape drive/media changer description
- World Wide Node Name of tape drive/media changer
- World Wide Port Name of tape drive/media changer
- Serial Number of tape drive/media changer
- Alias name of the tape drive/media changer
- Format used for tape cartridge mounted by tape drive
- Tape drive/media changer errors
- Node to which tape drive/media changer is attached
- Operational state of tape drive/media changer
- File number following last tape drive I/O operation
- Block number following last tape drive I/O operation
- Residual count following last tape drive I/O operation

### **[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### **[ -device-id <text> ] - Device ID**

Selects the tape drive/media changer with the specified device ID.

### **[ -node {<nodename>|local} ] - Node**

Displays detailed information about tape drives or media changers on the specified node.

### **[ -device-type <text> ] - Device Type**

Selects the devices with the specified type of tape drive or media changer.

### **[ -description <text> ] - Description**

Selects the tape drives/media changers with the specified description.

### **[ -alias-name <text> ] - Alias Name**

Selects the tape drive/media changer with the specified alias name.

### **[ -alias-mapping <text> ] - Alias Mapping**

Selects the tape drive/media changer with the specified alias mapping.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives/media changers with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the tape drive/media changer with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the tape drive/media changer with the specified serial number.

**[-functional-status {unknown|normal|error}] - Functional Status**

Selects the tape drives/media changers with the specified functional status of the device.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device Interface Type**

Selects the tape drives/media changers with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the tape drives/media changers with the specified operational state.

**[-format <text>,...] - Tape Cartridge Format**

Selects the tape drives with the specified tape format.

**[-error <text>] - Tape Error**

Selects the tape drives/media changers with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the tape drives/media changers with the specified initiator port.

**[-file-number <integer>] - File Number**

Selects the tape drives/media changers with the specified file number. The file number is the number of file marks between the beginning of media and current logical position. File number gets modified on write file mark, and forward or backward space file operations. A value of -1 indicates unknown position on the tape media or tape not loaded in the tape drive.

**[-block-number <integer>] - Block Number**

Selects the tape drives/media changers with the specified block number. The block number is the number of logical blocks between the beginning of tape media or the prior file mark and the current logical position on the tape media. Block number gets modified on writes, reads, and forward or backward space over records (blocks). The block number also gets reset to zero when a file mark is crossed or another file mark is written that designates a new file. If the tape is back spaced to a prior file mark, the block number might be zeroed. A value of -1 indicates unknown position on the tape media or that a tape not loaded in the tape drive.

**[-residual-count <integer>] - Residual Count of Last I/O Operation**

Selects the tape drives with the specified residual count.

**[-device-name-r <text>,...] - Device Name for Rewind**

Selects the tape drives with the specified device name for rewind.

**[-device-name-nr <text>,...] - Device Name for No Rewind**

Selects the tape drives with the specified device name for no rewind.

**[-device-name-ur <text>,...] - Device Name for Unload Reload**

Selects the tape drives with the specified device name for unload/reload.

**[-resv-type {off|persistent|scsi}] - Reservation Type for device**

Selects the tape drives with the specified type.

**[-aliases-name <text>,...] - Alias Names**

Selects the tape drive/media changer with the specified alias name.

**[-aliases-mapping <text>,...] - Alias Mappings**

Selects the tape drive/media changer with the specified alias mapping.

## Examples

The following example displays information about all tape drives and media changers attached to the cluster:

```
cluster1::> storage tape show

Node: cluster1-01
Device ID          Device Type      Description      Status
-----
sw4:10.11         tape drive      HP LT0-3        error
Node: cluster1-01
Device ID          Device Type      Description      Status
-----
sw4:10.11L1       media changer    PX70-TL         normal
```

The following example displays detailed information about a tape drive named sw4:10.11

```
cluster1::> storage tape show -device-id sw4:10.11

Node: cluster1-01
Device ID          Device Type      Description      Status
-----
sw4:10.11         tape drive      HP LT0-3        error
```

# storage tape trace

Enable/disable tape trace operations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command enables or disables diagnostic tape trace operations for all tape drives attached to the node you have specified.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the tape trace feature is enabled or disabled.

**[-is-trace-enabled {true|false}] - Tape Trace Enabled or Disabled**

Use this parameter to enable or disable the tape trace feature. By default, the tape trace feature is enabled.

## Examples

The following example enables tape trace operation on the node, cluster1-01.

```
cluster1::> storage tape trace -node cluster1-01 -is-trace-enabled true
```

# storage tape alias clear

Clear alias names

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command clears alias names for a tape drive or media changer.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**{ -name <text> - Alias Name That Is to Be Cleared**

Use this parameter to specify the alias name that is to be cleared. You can use the 'storage tape

show `-alias'` command to find more information about alias names of tape drives and media changers attached to a node. The `-clear-scope` and `-name` parameters are mutually exclusive. If you specify the `-name` parameter, a single alias name is cleared.

### **| `-clear-scope` {`tape`|`media-changer`|`all`} - Scope of Alias Clear Operation }**

Use this parameter to specify the scope of the alias clear operation. The `-clear-scope` and `-name` parameters are mutually exclusive. If you specify the `-clear-scope` parameter, multiple aliases are cleared depending upon the value of the parameter.

The possible values for `-clear-scope` are as follows:

- `tape` - Clear all tape drive aliases
- `media-changer` - Clear all media-changer aliases
- `all` - Clear both tape drive and media-changer aliases

## Examples

The following example clears an alias name 'st3' attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -name st3
```

The following example clears all tape drive alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope tape
```

The following example clears all media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope media-changer
```

The following example clears both tape and media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope all
```

## storage tape alias set

Set an alias name for tape drive or media changer

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command sets an alias name for a tape drive or media changer.

## Parameters

### **-node** {<nodename>|local} - Node

Use this parameter to specify the node to which the tape drive is attached.

### **-name** <text> - Alias Name for Tape Drive or Media Changer

Use this parameter to specify the alias name for tape drive or media changer. For a tape drive alias name, the format is 'st' followed by one or more digits. For a media changer alias name, the format is 'mc' followed by one or more digits.

### **-mapping** <text> - Mapping for Alias Name

Use this parameter to specify the mapping for an alias name. Use the format 'SN[<serial-number>]'. Valid mapping for serial numbers are in the format 'SN[<serial-number> ]' where the <serial-number> is from 2 to 124 characters long and includes the following characters: 0-9, a-z, and A-Z.

## Examples

The following example sets an alias name 'st3' for a tape drive with serial number SN[123456]L4 attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name st3 -mapping SN[123456]L4.
```

The following example sets an alias name 'mc1' for a media changer with serial number SN[65432] attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name mc1 -mapping SN[65432].
```

## storage tape alias show

Displays aliases of all tape drives and media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays aliases of all tape drives and media changers attached to every node in the cluster.

## Parameters

{[-fields <fieldname>,...]}

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Displays the tape drive and media changer aliases on the specified node.

[-alias-list <text>,...] - List of Aliases

Displays the node with the specified list of tape drive and media changer aliases.

## Examples

The following example shows the aliases of all tape drives and media changers attached to every node in the cluster:

```
cluster1::> storage tape alias show
```

```
Node: node1
```

Alias	Mapping
mc0	SN[00FRU7800000_LL0]L1
mc1	SN[00FRU7800000_LL1]L1
mc2	SN[aa6a64c69360a0980248c8]
mc3	SN[c940abe8b0c3a0980248c8]
mc4	SN[fba082e6b335a0980248c8]L5
st0	SN[HU19487T7N]
st1	SN[1068000230]
st10	SN[fba0c508b335a0980248c8]L7

```
Node: node2
```

Alias	Mapping
mc1	SN[c940982fc48c8]
st3	SN[ST456HT8N]L3
st2	SN[HG68000230]L2
st11	SN[aba673980248c8]L7

# storage tape config-file delete

Delete a tape config file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **storage tape config-file delete** command deletes the specified tape drive configuration file from all nodes that are currently part of the cluster.

## Parameters

**-filename <text> - Config File Filename**

This parameter specifies the name of the tape configuration file that will be deleted from all nodes that are currently part of the cluster.

## Examples

The following example deletes the specified tape drive configuration files on every node that is currently part of the cluster:

```
cluster1::> storage tape config-file delete -filename XYZ_LT0-6.TCF
```

# storage tape config-file get

Get a tape drive configuration file

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage tape config-file get** command uploads a specified tape drive configuration file to each node that is currently part of the cluster.

## Parameters

**-url <text> - Config File URL**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP and TFTP, are accepted.

## Examples

The following example uploads the specified tape drive configuration file to each node that is currently part of the cluster:

```
cluster1::> storage tape config-file get -url
http://example.com/~tapeconfigfile/XYZ_LTO-6.TCF
```

## storage tape config-file show

Display the list of tape drive configuration files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **storage tape config-file show** command lists the tape drive configuration files loaded onto each node in the cluster.

## Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ [-instance ] ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[ -node {<nodename>|local} ] - Node

Selects information about tape drive configuration files for the specified node.

[ -config-file <text> ] - Tape Config File

Selects information about the tape drive configuration file specified.

## Examples

The following example lists the tape drive config files loaded onto each node in the cluster:

```
cluster1::> storage tape config-file show

Node: node1

Tape Config Files
```

```

## storage tape library config show

Display connectivity to back-end storage tape libraries.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays information such as how the storage tape libraries connect to the cluster, LUN groups, number of LUNs, WWPN, and switch port information. Use this command to verify the cluster's storage tape library configuration or to assist in troubleshooting.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -switch ]**

If you specify this parameter, switch port information is shown.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller Name**

The name of the clustered node for which information is being displayed.

**[-group <integer>] - LUN Group**

A LUN group is a set of LUNs that shares the same path set.

**[-target-wwpn <text>] - Library Target Ports**

The World Wide Port Name of a storage tape library port.

**[-initiator <text>] - Initiator**

The host bus adapter that the clustered node uses to connect to storage tape libraries.

**[-array-name <array name>] - Library Name**

Name of the storage tape library that is connected to the clustered node.

**[-target-side-switch-port <text>] - Target Side Switch Port**

This identifies the switch port that connects to the tape library's target port.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

This identifies the switch port that connects to the node's initiator port.

**[-lun-count <integer>] - Number of LUNS**

This is a command-line switch (-lun-count) used to restrict what LUN groups are displayed in the output.

## Examples

The following example displays the storage tape library configuration information.

```
cluster1::> storage tape library config show
      LUN  LUN
Node   Group Count          Library Name      Library Target Port
Initiator
-----
cluster1-01
      0    2          TAPE_LIB_1      50050763124b4d6f
3d
cluster1::>
```

## storage tape library path show-by-initiator

Display a list of LUNs on the given tape library

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays path information for every initiator port connected to a tape library. The output is similar to the storage library path show command but the output is listed by initiator.

## Parameters

**{ [-fields <fieldname>, ...]**

fields used to be used in this display

**l [-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage tape library that is being used.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the tape library.

**[-array-name <array name>] - Library Name**

Name of the storage tape library that is connected to the cluster.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the library path.

**[-path-iops <integer>] - Number of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the library path.

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of I/O per second on Initiator (Rolling Average)**

>Rolling average of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

**[-target-iops <integer>] - Number of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

## Examples

The following example displays the path information by initiator for a storage tape library.

```
cluster1::> storage tape library path show-by-initiator
Node: cluster1-01
      Initiator I/O      Initiator Side      Path I/O      Target Side
Target I/O
Initiator      (KB/s)      Switch Port      (KB/s)      Switch Port
(KB/s)      Target Port Library Name
-----
0b              0 sw_tape:6              0              sw_tape:0
0 510a09800000412d TAPE_LIB_1
                                sw_tape:1
0 510a09820000412d TAPE_LIB_1
3d              0 N/A              0              N/A
0 50050763124b4d6f TAPE_LIB_2
3 entries were displayed.
```

## storage tape library path show

Display a list of Tape Libraries on the given path

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays path information for a tape library and has the following parameters by default:

- Node name
- Initiator port
- Target port
- TPGN (Target Port Group Number)
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

## Parameters

**{ [-fields <fieldname>, ... ]**

fields used to be used in this display

**| [-detail ]**

Using this option displays the following:

- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

**| [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-array-name <array name>] - Library Name**

Name of the storage tape library that is connected to the cluster.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage tape library that is being used.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path(Rolling Average)**

Rolling average of Kbytes of I/O per second on the library path.

**[-path-iops <integer>] - Number of I/O per second on Path(Rolling Average)**

Rolling average of I/O per second on the library path.

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator(Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of I/O per second on Initiator(Rolling Average)**

Rolling average of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target(Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

**[-target-iops <integer>] - Number of I/O per second to Target(Rolling Average)**

Rolling average of I/O per second on the target port.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the tape library.

**[-path-link-errors <integer>] - Link Error count on path**

Fibre Channel link error count.

**[-path-quality <integer>] - Percentage of weighted error threshold**

A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

**[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path**

Number of LUNs on this path.

**[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator**

Number of LUNs on this initiator.

**[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target**

Number of LUNs on this target.

## Examples

The following example displays the path information for a storage tape library

```
cluster1::> storage tape library path show
Node          Initiator  Target Port          TPGN   Speed      (KB/s)
IOPs
-----
cluster1-01
0            0          3d          50050763124b4d6f    61     4 Gb/S
```

```
cluster1-01
0          0          0b          510a09800000412d          35  4 Gb/S
cluster1-01
0          0          0b          510a09820000412d          1   4 Gb/S
3 entries were displayed.
```

## storage tape load-balance modify

Modify the tape load balance configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage tape load-balance modify** command modifies the tape load balance setting for a specified node in the cluster.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node on which the tape load balance setting is to be modified.

**[-is-enabled {true|false}] - Is Tape Load Balance Enabled**

This parameter specifies whether tape load balancing is enabled on the node. The default setting is false.

### Examples

The following example modifies the tape load balance setting on node1 in the cluster:

```
cluster1::> storage tape load-balance modify -node node1 -is-enabled true
```

## storage tape load-balance show

Displays the tape load balance configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **storage tape load-balance show** command displays tape load balance settings for each node in

the cluster.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about tape load balancing for the specified node.

**[-is-enabled {true|false}] - Is Tape Load Balance Enabled**

Selects information about load balance configuration as specified by enabled or disabled setting.

## Examples

The following example shows the load balance setting for each node in the cluster:

```
cluster1::> storage tape load-balance show
```

Node	Enabled
node1	false
node2	false

2 entries were displayed.

## system bridge add

Add a bridge for monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system bridge add** command enables you to add FC-to-SAS bridges for SNMP monitoring in a MetroCluster configuration.

## Parameters

**-name <text> - Bridge Name**

This parameter identifies the bridge being added. It is required only when the managed-by parameter is set to in-band.

**[-managed-by {SNMP|in-band}] - Bridge Management Method**

This parameter specifies whether the bridge uses the SNMP or in-band management method. FibreBridge 6500N uses SNMP only; FibreBridge 7500N may use either.

**[-address <IP Address>] - Bridge Management Port IP Address**

This parameter specifies the IP address of the bridge that is being added for monitoring.

**[-snmp-community <text>] - SNMP Community**

This parameter specifies the SNMP community set on the bridge that is being added for monitoring.

**[-veto-backend-fabric-check {true|false}] - Veto Backend Fabric Check**

If specified, the `system bridge add` command will not check if the bridge is present in the MetroCluster's backend fabric. By default, it does not let you add bridges that are not present.

## Examples

The following command adds a bridge with IP address '10.226.197.16' for monitoring:

```
cluster1::> system bridge add -address 10.226.197.16
cluster1::> system bridge show
```

Monitor	Bridge	Symbolic Name	Vendor	Model	Bridge WWN	Is Monitored By	Managed
	ATTO_10.226.197.16	Bridge Number 16	Atto	FibreBridge 6500N	2000001086603824	true	SNMP -
	ATTO_FibreBridge6500N_2	Not Set	Atto	FibreBridge 6500N	20000010866037e8	false	SNMP -
	ATTO_FibreBridge6500N_3	Not Set	Atto	FibreBridge 6500N	2000001086609e0e	false	SNMP -
	ATTO_FibreBridge6500N_4	Not Set	Atto	FibreBridge 6500N	2000001086609c06	false	SNMP -

```
4 entries were displayed.
cluster1::>
```

# system bridge modify

Modify a bridge's configuration information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system bridge modify** enables you to modify certain parameters for identifying and accessing the FC-to-SAS bridges added for monitoring in a MetroCluster configuration.

## Parameters

### **-name <text> - Bridge Name**

This parameter specifies the name of the bridge.

### **[-address <IP Address>] - Bridge IP Address**

This parameter specifies the IP address of the bridge.

### **[-snmp-community <text>] - SNMP Community Set on the Bridge**

This parameter specifies the SNMP community set on the bridge.

### **[-managed-by {SNMP|in-band}] - Bridge Management Method**

This parameter specifies whether the bridge uses the SNMP or in-band management method. FibreBridge 6500N uses SNMP only; FibreBridge 7500N may use either.

### **[-node-visible-list <text>,...] - Nodes Bridge is Visible To**

This parameter specifies bridges that are visible to the node.

## Examples

The following command modifies 'ATTO\_10.226.197.16' bridge SNMP community to 'public':

```
cluster1::> system bridge modify -name ATTO_10.226.197.16 -address 10.226.197.16 -snmp
-community public
cluster1::>
```

# system bridge refresh

Refresh bridge info

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system bridge refresh** command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the **system switch fiber-channel add** and [system bridge add](#) commands respectively.

## Examples

The following command triggers a refresh for the SNMP data:

```
cluster1::*> system bridge refresh
cluster1::*>
```

## Related Links

- [system bridge add](#)

# system bridge remove

Remove a bridge from monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system bridge remove** enables you to remove FC-to-SAS bridges that were previously added for SNMP monitoring.

## Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge added for monitoring.

## Examples

The following command removes 'ATTO\_10.226.197.16' bridge from monitoring:

```
cluster1::> system bridge remove -name ATTO_10.226.197.16
cluster1::> system bridge show
```

Bridge	Symbolic Name	Vendor	Model	Bridge WWN	Is Monitored	Monitor Status
ATTO_FibreBridge6500N_1						

```

      Bridge Number 16
                Atto  FibreBridge 6500N
                        2000001086603824 false  -
ATTO_FibreBridge6500N_2
      Not Set      Atto  FibreBridge 6500N
                        20000010866037e8 false  -
ATTO_FibreBridge6500N_3
      Not Set      Atto  FibreBridge 6500N
                        2000001086609e0e false  -
ATTO_FibreBridge6500N_4
      Not Set      Atto  FibreBridge 6500N
                        2000001086609c06 false  -

4 entries were displayed.

```

## system bridge run-cli

Execute a CLI command on a bridge

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage bridge run-cli` command enables you to execute an ATTO bridge command.

### Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge that the command is to be executed on.

**-command <text> - CLI command to execute**

This parameter specifies the command to be executed on the named bridge.

### Examples

The following example executes a command on a bridge

```
sti8040mcc-201_siteA:> storage bridge run-cli -name ATTO_FibreBridge7500N_1 -command "Help"
```

## system bridge show

Display bridge information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system bridge show** command displays information about all the storage bridges in the MetroCluster configuration. The bridges must have been previously added for monitoring using the **system bridge add** command. If no parameters are specified, the default command displays the following information about the bridges:

- Bridge
- Symbolic Name
- Vendor
- Model
- Bridge WWN
- Is Monitored
- Is Bridge Secure
- Managed By
- Monitor Status

To display detailed profile information about a single bridge, use the **-name** parameter.

## Parameters

**{ [-fields <fieldname>, ... ]**

Displays the specified fields for all the bridges, in column style output.

**[ [-connectivity ]**

Displays the following details about the connectivity from different entities to the bridge:

- Node
- Initiator
- Initiator Side Switch Port
- Target Side Switch Port
- Target Port WWN
- Target Port Number

**[ [-cooling ]**

Displays the following details about the chassis temperature sensor(s) on the bridge:

- Sensor Name
- Reading in degree Celsius ©
- Fan operational status
- Minimum Safe Operating Temperature in degree Celsius ©

- Maximum Safe Operating Temperature in degree Celsius ©
- Sensor Status

**[ -error ]**

Displays the errors related to the bridge.

**[ -ports ]**

Displays the following details about the bridge FC ports:

- Port number
- Port administrative status
- Port operational status
- Port operating mode
- Port negotiated speed
- Peer world wide name

Displays the following details about the bridge SAS ports:

- Port number
- Port negotiated data rate
- Port data rate capability
- Port PHY1 operational status
- Port PHY2 operational status
- Port PHY3 operational status
- Port PHY4 operational status
- Port administrative status
- Port operational status
- Peer world wide name

**[ -power ]**

Displays the status of the replaceable power supplies for the FibreBridge 7500N only:

- Power supply name
- Power supply status

**[ -sfp ]**

Displays the following details about the bridge FC ports Small Form-factor Pluggable (SFP):

- Port number
- SFP vendor
- SFP serial number
- SFP part number

- SFP speed capability

Displays the following details about the bridge SAS ports Quad Small Form-factor Pluggable (QSFP):

- Port number
- QSFP vendor
- QSFP serial number
- QSFP type
- QSFP part number

Displays the following details about the bridge SAS ports Mini-SAS HD:

- Port number
- Mini-SAS HD vendor
- Mini-SAS HD serial number
- Mini-SAS HD type
- Mini-SAS HD part number

#### **[ -stats ]**

Displays the following details about the bridge FC ports:

- Port number
- Port operational status
- Port operational mode
- Port negotiated speed
- Port link failure count
- Port synchronization loss count
- Port CRC error count
- Port operational mode
- Port received word count (Rx)
- Port transmitted word count (Tx)

Displays the following details about the bridge SAS ports:

- Port number
- PHY port number
- Port negotiated speed
- Port speed capability
- Port invalid DWORD count
- Port disparity error count
- Port synchronization loss count

- Port PHY reset count
- Port link changed count
- Port CRC error count

**[`-instance` ] }**

Displays expanded information about all the bridges in the system. If a bridge is specified, then this parameter displays the same detailed information for the bridge you specify as does the `-name` parameter.

**[`-name <text>`] - Bridge Name**

Displays information only about the bridges that match the name you specify.

**[`-wwn <text>`] - Bridge World Wide Name**

Displays information only about the bridges that match the bridge WWN you specify.

**[`-model <text>`] - Bridge Model**

Displays information only about the bridges that match the bridge model you specify.

**[`-vendor {unknown|Atto}`] - Bridge Vendor**

Displays information only about the bridges that match the bridge vendor you specify.

**[`-fw-version <text>`] - Bridge Firmware Version**

Displays information only about the bridges that match the bridge firmware version you specify.

**[`-serial-number <text>`] - Bridge Serial Number**

Displays information only about the bridges that match the bridge serial number you specify.

**[`-address <IP Address>`] - Bridge IP Address**

Displays information only about the bridges that match the bridge IP address you specify.

**[`-is-monitoring-enabled {true|false}`] - Is Monitoring Enabled for Bridge?**

Displays information only about the bridges that match the bridge monitoring value you specify.

**[`-status {unknown|ok|error}`] - Bridge Status**

Displays information only about the bridges that match the bridge monitoring status you specify.

**[`-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}`] - Bridge Profile Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the profile data last successful refresh timestamp you specify.

**[`-symbolic-name <text>`] - Bridge Symbolic Name**

Displays information only about the bridges that match the symbolic name you specify.

**[`-snmp-community <text>`] - SNMP Community Set on the Bridge**

Displays information only about the bridges that match the bridge SNMP community you specify.

**[-managed-by {SNMP|in-band}] - Bridge Management Method**

This parameter specifies whether the bridge uses the SNMP or in-band management method. FibreBridge 6500N uses SNMP only; FibreBridge 7500N may use either.

**[-is-bridge-secure {true|false}] - Is Security Enabled For Bridge?**

Displays information only about the bridges that match the bridge security value you specify.

**[-node-visible-list <text>,...] - Nodes Bridge is Visible To**

Displays information only about the bridges that are available to the node.

**[-error-text-list <text>,...] - Bridge Error Description List**

Displays information only about the bridges that have the errors you specify.

**[-temp-sensor-name <text>] - Temperature Sensor Name**

Displays information only about the bridges that have the temperature sensor with the name you specify.

**[-min-safe-oper-temp <integer>] - Minimum Safe Operating Temperature in Degree Celsius**

Displays information only about the bridges that have the temperature sensor with the minimum safe operating temperature you specify.

**[-max-safe-oper-temp <integer>] - Maximum Safe Operating Temperature in Degree Celsius**

Displays information only about the bridges that have the temperature sensor with the maximum safe operating temperature you specify.

**[-temp-reading <integer>] - Chassis Temperature Sensor Reading in Degree Celsius**

Displays information only about the bridges that have the temperature sensors with the reading you specify.

**[-temp-sensor-status {normal|warning|critical}] - Chassis Temperature Sensor Status**

Displays information only about the bridges that have the temperature sensor with the status you specify.

**[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge Chassis Temperature Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the temperature sensor data last successful refresh timestamp you specify.

**[-fc-port-index-list <integer>,...] - Bridge FC Port Index List**

Displays information only about the bridges that have the ports with the indexes you specify.

**[-fc-port-oper-state-list {unknown|online|offline}] - Bridge FC Port Operational State List**

Displays information only about the bridges that have the ports with the operational states you specify.

**[-fc-port-admin-state-list {unknown|disabled|enabled}] - Bridge FC Port Admin State List**

Displays information only about the bridges that have the ports with the administrative states you

specify.

**[-fc-port-negotiated-data-rate-list {unknown|2|4|8|16}] - Bridge FC Port Negotiated Data Rate List**

Displays information only about the bridges that have the ports with the negotiated data rates you specify.

**[-fc-port-negotiated-conn-mode-list {unknown|loop|n-port}] - Bridge FC Port Negotiated Connection Mode List**

Displays information only about the bridges that have the ports with the negotiated connection modes you specify.

**[-fc-port-wwn-list <text>,...] - Bridge FC Port WWN List**

Displays information only about the bridges that have the ports with the world-wide names you specify.

**[-fc-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge FC Port Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the FC ports data last successful refresh timestamp you specify.

**[-fc-port-stats-index-list <integer>,...] - Bridge FC Port Index List**

Displays information only about the bridges that have the ports with the indexes you specify.

**[-fc-port-tx-words-list <integer>,...] - Bridge FC Port Transmitted Word Count List**

Displays information only about the bridges that have the ports with the number of transmitted words you specify.

**[-fc-port-rx-words-list <integer>,...] - Bridge FC Port Received Word Count List**

Displays information only about the bridges that have the ports with the number of received words you specify.

**[-fc-port-link-failures-list <integer>,...] - Bridge FC Port Link Failure Count List**

Displays information only about the bridges that have the ports with the number of link failures you specify.

**[-fc-port-sync-losses-list <integer>,...] - Bridge FC Port Sync Loss Count List**

Displays information only about the bridges that have the ports with the number of synchronization losses you specify.

**[-fc-port-invalid-crc-list <integer>,...] - Bridge FC Port Invalid CRC Count List**

Displays information only about the bridges that have the ports with the number of invalid CRCs you specify.

**[-fc-port-stats-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge FC Port Stats Last Successful Refresh Timestamp**

Displays information only about the bridges that match the FC port stats data last successful refresh timestamp you specify.

**[-sas-port-index-list <integer>,...] - Bridge SAS Port Index List**

Displays information only about the bridges that have the SAS ports with the indexes you specify.

**[-sas-port-oper-state-list {unknown|online|offline|degraded}] - Bridge SAS Port Operational State List**

Displays information only about the bridges that have the SAS ports with the operational states you specify.

**[-sas-port-phy1-oper-state-list {unknown|online|offline}] - Bridge SAS Port PHY1 Operational State List**

Displays information only about the bridges that have the SAS ports with the PHY1 operational states you specify.

**[-sas-port-phy2-oper-state-list {unknown|online|offline}] - Bridge SAS Port PHY2 Operational State List**

Displays information only about the bridges that have the SAS ports with the PHY2 operational states you specify.

**[-sas-port-phy3-oper-state-list {unknown|online|offline}] - Bridge SAS Port PHY3 Operational State List**

Displays information only about the bridges that have the SAS ports with the PHY3 operational states you specify.

**[-sas-port-phy4-oper-state-list {unknown|online|offline}] - Bridge SAS Port PHY4 Operational State List**

Displays information only about the bridges that have the SAS ports with the PHY4 operational states you specify.

**[-sas-port-admin-state-list {unknown|disabled|enabled}] - Bridge SAS Port Administrative State List**

Displays information only about the bridges that have the SAS ports with the administrative states you specify.

**[-sas-port-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Data Rate Capability List**

Displays information only about the bridges that have the SAS ports with the data rate capabilities you specify.

**[-sas-port-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Negotiated Data Rate List**

Displays information only about the bridges that have the SAS ports with the negotiated data rates you specify.

**[-sas-port-wwn-list <text>,...] - Bridge SAS Port WWN List**

Displays information only about the bridges that have the SAS ports with the world-wide names you specify.

**[-sas-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge SAS Port DB Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the SAS ports data last successful refresh timestamp you specify.

**[-sas-port-stats-phy-index-list <integer>,...] - Bridge SAS Port PHY Index List**

Displays information only about the bridges that have the SAS ports with the PHY indexes you specify.

**[-sas-port-link-changed-list <integer>,...] - Bridge SAS Port Link Changed Count List**

Displays information only about the bridges that have the SAS ports with the link changed count you specify.

**[-sas-port-invalid-crc-list <integer>,...] - Bridge SAS Port Invalid CRC Count List**

Displays information only about the bridges that have the SAS ports with the invalid CRCs you specify.

**[-sas-port-phy-reset-list <integer>,...] - Bridge SAS Port PHY Reset Count List**

Displays information only about the bridges that have the SAS ports with the PHY reset count you specify.

**[-sas-port-sync-losses-list <integer>,...] - Bridge SAS Port Sync Loss Count List**

Displays information only about the bridges that have the SAS ports with the synchronization losses you specify.

**[-sas-port-disparity-count-list <integer>,...] - Bridge SAS Port Disparity Count List**

Displays information only about the bridges that have the SAS ports with the disparity count you specify.

**[-sas-port-invalid-dword-list <integer>,...] - Bridge SAS Port Invalid DWORD Count List**

Displays information only about the bridges that have the SAS ports with the invalid DWORD count you specify.

**[-sas-port-stats-index-list <integer>,...] - Bridge SAS Port Index List**

Displays information only about the bridges that have the SAS ports with the indexes you specify.

**[-sas-port-stats-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Data Rate Capability List**

Displays information only about the bridges that have the SAS ports with the data rate capabilities you specify.

**[-sas-port-stats-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Negotiated Data Rate List**

Displays information only about the bridges that have the SAS ports with the negotiated data rates you specify.

**[-sas-port-stats-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] -**

**Bridge SAS Port Statistics Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the SAS port stats data last successful refresh timestamp you specify.

**[-fc-sfp-port-index-list <integer>,...] - Bridge FC Port Index List**

Displays information only about the bridges that have the FC ports with the indexes you specify.

**[-fc-port-sfp-vendor-list <text>,...] - Bridge FC Port SFP Vendor List**

Displays information only about the bridges that have the FC ports with the SFP vendors you specify.

**[-fc-port-sfp-serial-number-list <text>,...] - Bridge FC Port SFP Serial Number List**

Displays information only about the bridges that have the FC ports with the SFP serial numbers you specify.

**[-fc-port-sfp-part-number-list <text>,...] - Bridge FC Port SFP Part Number List**

Displays information only about the bridges that have the FC ports with the SFP part numbers you specify.

**[-fc-port-sfp-data-rate-capability-list {2Gb|4Gb|8Gb|16Gb|32Gb}] - Bridge FC Port SFP Data Rate Capability List**

Displays information only about the bridges that have the FC ports with the SFP data rate capabilities you specify.

**[-fc-port-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] -**

**Bridge FC Port SFP Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the FC ports SFP data last successful refresh timestamp you specify.

**[-sas-qsfp-port-index-list <integer>,...] - Bridge SAS Port Index List**

Displays information only about the bridges that have the SAS ports with the indexes you specify.

**[-sas-port-qsfp-vendor-list <text>,...] - Bridge SAS Port QSFP Vendor List**

Displays information only about the bridges that have the SAS ports with the QSFP vendors you specify.

**[-sas-port-qsfp-serial-number-list <text>,...] - Bridge SAS Port QSFP Serial Number List**

Displays information only about the bridges that have the SAS ports with the QSFP serial numbers you specify.

**[-sas-port-qsfp-type-list {unknown|optical|active-copper|passive-copper}] - Bridge SAS Port QSFP Type List**

Displays information only about the bridges that have the SAS ports with the QSFP types you specify.

**[-sas-port-qsfp-part-number-list <text>,...] - Bridge SAS Port QSFP Part Number List**

Displays information only about the bridges that have the SAS ports with the QSFP part numbers you specify.

**[-sas-port-qsfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge SAS Port QSFP Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the SAS ports QSFP data last successful refresh timestamp you specify.

**[-mini-sas-hd-index-list <integer>,...] - Bridge Mini-SAS HD Index List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD indexes that you specify.

**[-mini-sas-hd-vendor-list <text>,...] - Bridge Mini-SAS HD Vendor List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD vendors that you specify.

**[-mini-sas-hd-serial-number-list <text>,...] - Bridge Mini-SAS HD Serial Number List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD serial numbers that you specify.

**[-mini-sas-hd-type-list <text>,...] - Bridge Mini-SAS HD Type List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD types that you specify.

**[-mini-sas-hd-part-number-list <text>,...] - Bridge Mini-SAS HD Part Number List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD part numbers that you specify.

**[-mini-sas-hd-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge Mini-SAS HD Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the SAS ports Mini-SAS HD data with the last successful refresh timestamp that you specify.

**[-power-supply-index-list <integer>,...] - Bridge Power Supply Index List**

Displays information only about the bridges that have power supplies with the indexes that you specify.

**[-power-supply-name-list <text>,...] - Bridge Power Supply Name List**

Displays information only about the bridges that have power supplies with the name that you specify.

**[-power-supply-status-list {unknown|down|up}] - Bridge Power Supply Status List**

Displays information only about the bridges that have power supplies with the status that you specify.

**[-power-supply-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] -**

### Bridge Power Supply Data Last Successful Refresh Timestamp

Displays information only about the bridges that match the power supply last data with the last successful refresh timestamp that you specify.

**[-node-list {<nodename>|local}] - Node Name List**

Displays information only about the bridges that are connected to the nodes you specify.

**[-initiator-list <text>,...] - Initiator List**

Displays information only about the bridges that are connected to the nodes hosting the initiators you specify.

**[-initiator-side-switch-port-name-list <text>,...] - Initiator Side Switch Port Name List**

Displays information only about the bridges that are connected to the initiator-side switch ports you specify.

**[-target-side-switch-port-name-list <text>,...] - Target Side Switch Port Name List**

Displays information only about the bridges that are connected to the target-side switch ports you specify.

**[-target-port-wwn-list <text>,...] - Target Port WWN List**

Displays information only about the bridges that match the target ports with world-wide names you specify.

**[-target-port-index-list <integer>,...] - Target Port Index List**

Displays information only about the bridges that match the target ports with indexes you specify.

## Examples

The following example displays information about all bridges:

```
cluster1::> system bridge show
```

Bridge	Symbolic Name	Vendor	Model	Bridge WWN	Is Monitored	Monitor Status
ATTO_10.226.197.16	Bridge Number 16 retyped	Atto	FibreBridge	6500N 2000001086603824	true	ok
ATTO_10.226.197.17	Not Set	Atto	FibreBridge	6500N 20000010866037e8	true	ok
ATTO_10.226.197.18	Not Set	Atto	FibreBridge	6500N 2000001086609e0e	true	ok
ATTO_10.226.197.19	Not Set	Atto	FibreBridge	6500N 2000001086609c06	true	ok

```
4 entries were displayed.
cluster1::>
```

The following example displays connectivity (node to bridge) information about all bridges:

```
cluster1::> system bridge show -connectivity
Bridge Name: ATTO_10.226.197.16
  Bridge WWN: 2000001086603824
    Vendor: Atto
      Model: FibreBridge 6500N
        Serial Number: FB6500N101405
          Firmware Version: 1.60 A68E 51.01
            Management IP: 10.226.197.16

# system bridge config-dump collect

Retrieve and save bridge dumpconfiguration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system bridge config-dump collect` command retrieves a dumpconfiguration file from a system bridge.

## Parameters

**-bridge <text> - Bridge Name**

Use this parameter to retrieve a dumpconfiguration file from the specified bridge.

## Examples

The following example retrieves a dumpconfiguration file from bridge ATTO\_FibreBridge7500N\_1:

```
cluster1::*> system bridge config-dump collect -bridge ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the dumpconfiguration file from bridge
"ATTO_FibreBridge7500N_1".
```

```
cluster1::*>
```

# system bridge config-dump delete

Delete a dumpconfiguration file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system bridge config-dump delete` command deletes dumpconfiguration files previously retrieved with the [system bridge config-dump collect](#) command.

## Parameters

`-node {<nodename>|local}` - Node

Use this parameter to delete a dumpconfiguration file stored on the specified node.

`-file <text>` - Config File

Use this parameter to delete the dumpconfiguration file with the specified file name.

## Examples

The following example deletes `dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt` from node1:

```
cluster1::*> system bridge config-dump delete -node node1 -file
dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt

cluster1::*>
```

## Related Links

- [system bridge config-dump collect](#)

# system bridge config-dump show

Display a list of bridge dumpconfiguration files

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system bridge config-dump show` command displays information about all the dumpconfiguration files previously retrieved with the [system bridge config-dump collect](#) command. If no parameters are specified, the default command displays the following information about the dumpconfiguration files:

- Node
- File Name
- Timestamp

- Bridge
- Bridge Serial Number

To display detailed information about a single dumpconfiguration file, use the **-node** and **-file** parameters.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays information about the dumpconfiguration files stored on the node that matches the specified node name.

**[-file <text>] - Config File**

Displays information about the dumpconfiguration files that match the specified file name.

**[-bridge <text>] - Bridge Name**

Displays information about the dumpconfiguration files from the bridge that matches the specified bridge name.

**[-serial-number <text>] - Serial Number of Bridge**

Displays information about the dumpconfiguration files from the bridge that matches the specified serial number.

**[-timestamp <MM/DD/YYYY HH:MM:SS>] - Time of Collection**

Displays information about the dumpconfiguration files that were collected at the specified time.

## Examples

The following example displays information about all dumpconfiguration files:

```
cluster1::*> system bridge config-dump show

Bridge: ATTO_FibreBridge7500N_1

Node  File Name                                     Timestamp

# system bridge coredump collect

Retrieve and save coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system bridge coredump collect** command retrieves a core file from a bridge.

## Parameters

**-name <text>** - Bridge Name

This parameter specifies the bridge name from which the coredump file is to be collected.

## Examples

The following example retrieves a coredump from bridge ATTO\_FibreBridge7500N\_1:

```
cluster1::> system bridge coredump collect -bridge ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the coredump from bridge "ATTO_FibreBridge7500N_1".

cluster1::>
```

# system bridge coredump delete

Delete a saved coredump file.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system bridge coredump delete` command deletes a coredump file previously retrieved with the `system bridge coredump collect` command.

## Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge that the coredump file belongs to.

**-corename <text> - Coredump Filename**

This parameter specifies the name of the coredump file to be deleted.

## Examples

The following example deletes coredump file `core.FB7500N100018.1970-01-05.17_50_30.mem` collected from bridge ATTO\_FibreBridge7500N\_1:

```
cluster1::> system bridge coredump delete -name ATTO_FibreBridge7500N_1 -corename
core.FB7500N100018.1970-01-05.17_50_30.mem

cluster1::>
```

## Related Links

- [system bridge coredump collect](#)

# system bridge coredump show

Display a list of bridge coredumps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system bridge coredump show** command displays information about all the coredump files previously retrieved with the **system bridge coredump collect** command. If no parameters are specified, the default command displays the following information about the coredump files:

- Bridge Name
- Bridge Serial Number
- Coredump Filename
- Located on Node
- Panic Timestamp
- Panic String

To display detailed information about a single coredump file, use the **-node** and **-corename** parameters.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-serial-number <text>] - Bridge Serial Number**

Use this parameter to select the coredump files from the bridge that matches the specified bridge serial number.

**[-corename <text>] - Coredump Filename**

Use this parameter to select the coredump files that matches the specified file name.

**[-name <text>] - Bridge Name**

Use this parameter to select the coredump files from the bridge that matches the specified bridge name.

**[-node <nodename>] - Located on Node**

Use this parameter to select the coredump the coredump files that are located on the specified

node.

### **[-panic-time <MM/DD/YYYY HH:MM:SS>] - Panic Timestamp**

Use this parameter to select the coredump files that were collected at the specified time.

### **[-panic-string <text>] - Panic String**

Use this parameter to select the coredump files that matches the specified panic string.

## Examples

The following example displays information about all coredump files:

```
cluster1::> system bridge coredump show
Bridge Name: ATTO_FibreBridge7500N_1
Bridge Serial Number: FB7500N100018
  Coredump Filename: core.FB7500N100018.1970-01-05.17_50_30.mem
  Located on Node: stg-8020-6a
  Panic Timestamp: 7/6/2017 11:03:37
  Panic String: CoreDumpGenerate CLI Command

cluster1::>
```

# system bridge firmware update

Download firmware onto the bridge so it can be updated

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system bridge firmware update** command downloads the firmware onto the bridge. The bridge needs to be rebooted for the firmware update to occur. The firmware file to be used is specified by the `-uri` parameter.

## Parameters

### **-bridge <text> - Bridge Name**

This specifies the bridge whose firmware needs to be updated.

### **-uri <text> - URI**

This parameter specifies the URI from which the firmware file is downloaded onto the bridge.

**[-skip <true>] - Skip Checking for Port Path = 2**

Use this optional parameter to skip the bridge path checking allowing a firmware file to be downloaded onto the bridge. Note that doing so might cause multiple device failures.

## Examples

The following example updates the firmware on bridge ATTO\_FibreBridge7500N\_1.

```
cluster1::*> system bridge firmware update -bridge ATTO_FibreBridge7500N_1 -uri
http://10.60.132.97/firmware.zbd
```

# system bridge options modify

Enable or disable configurable options for all bridges

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system bridge options modify** command alters the value of configurable options which affect all the ATTO FibreBridges in the cluster configuration.

## Parameters

**-option-name <text> - Option Name**

The options supported are:

- enable.automagic.addition

Allowable values: {true, false}

The enable.automagic.addition option controls whether or not ATTO FibreBridge 7500N and FibreBridge 7600N bridges are automatically added for in-band monitoring by the Fabric Health Monitor.

If set to true, the feature is enabled and all ATTO FibreBridge 7500N and FibreBridge 7600N bridges in the cluster will automatically be added for in-band monitoring by the Fabric Health Monitor. This is the preferred and default value.

If set to false, the feature is disabled and ATTO bridges will not automatically be added for monitoring. This value should only be used if you do not want to monitor the bridges at all, or if you want them to be monitored via SNMP.

The ATTO FibreBridge 6500N does not have the capability to be monitored by in-band management, so this option does not apply to the 6500N.

Note that this command is cluster-specific. To affect both clusters of a MetroCluster system, the command must be executed once on each cluster of the MetroCluster system.

### **[-option-value <text>] - Option Value**

This parameter provides the value for each option. Allowable values for each option are specified in the option description above.

## Examples

The following example sets the `enable.automatic.addition` option to `true`:

```
siteA::*> system bridge options modify -option-name enable.automatic.addition -option
-value true
siteA::*>
```

## system bridge options show

Show state of configurable options for all bridges

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system bridge options show` command displays the value of configurable options which apply to all ATTO FibreBridges in the cluster configuration. If the user specifies the command without parameters, the output displays the current value of all the configurable options supported by the cluster.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-option-name <text>] - Option Name**

The options supported are:

- **enable.automatic.addition**

Allowable values {true, false}.

This option controls whether or not bridges are automatically added for in-band monitoring by

the Fabric Health Monitor.

If set to true, the feature is enabled and all ATTO 7500N and 7600N bridges will automatically be added for in-band monitoring by the Fabric Health Monitor.

If set to false, the feature is disabled and ATTO FibreBridges will not be automatically added for monitoring. They can be left unmonitored, or manually added for SNMP monitoring.

Note that this command is cluster-specific. To determine the option setting on both clusters of a MetroCluster system, the command must be executed once on each cluster of the MetroCluster system.

### **[-option-value <text>] - Option Value**

The option-value parameter specifies the value of the option. Allowable values are described for each option supported in the list above.

## Examples

The following example displays the current setting of the bridge options:

```
siteA::*> system bridge options show
Option Name           Option Value           Option Hint
-----
enable.automatic.addition  true                   {true,false} - enable auto-add
siteA::*>
```

## system chassis show

Display all the chassis in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system chassis show** command displays information about all the chassis in the cluster. By default, the command displays the following information about all the chassis in the cluster:

- Chassis ID
- Status
- List of nodes in the chassis

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

Selects the fields that you specify.

**[ [-instance ] ] }**

Displays detailed information about all the chassis in the cluster.

**[-chassis-id <text>] - Chassis ID**

Selects information about the specified chassis.

**[-member-nodes {<nodename>|local}] - List of Nodes in the Chassis**

Selects information about the chassis with the specified member node list.

**[-num-nodes <integer>] - Number of Nodes in the Chassis**

Selects information about the chassis with the specified number of nodes.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the chassis with the specified status.

## Examples

The following example displays information about all the chassis in the cluster:

```
cluster1::> system chassis show
```

Chassis ID	Status	List of Nodes
4591227214	ok	node1,node2
4591227000	ok	node1,node2

The following example displays detailed information about a specific chassis:

```
cluster1::> system chassis show -chassis-id 4591227214 -instance
```

```

                Chassis ID: 4591227214
List of Nodes in the Chassis: node1,node2
Number of Nodes in the Chassis: 2
                Status: ok

```

## system chassis fru show

Display the FRUs in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system chassis fru show** command displays information about all the major chassis specific FRUs in the cluster. By default, the command displays the following information about all the FRUs in the cluster:

- Chassis ID
- FRU name
- FRU type
- FRU state
- Nodes sharing the FRU

To display more details, use the **-instance** parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**[-instance ] }**

Displays detailed information about FRUs.

**[-node {<nodename>|local}] - Node**

Specifies the primary node name in the cluster on which Chassis health monitor is running.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-fru-name <text>] - FRU Name**

Selects information about the FRU with the specified FRU name.

**[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type**

Selects information about all the FRUs with the specified FRU type.

**[-name <text>] - FRU ID**

Selects information about the FRU with the specified FRU unique name.

**[-state <text>] - FRU State**

Selects information about all the FRUs with the specified state.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about all the FRUs with the specified status.

**[-display-name <text>] - Display Name for the FRU**

Selects information about all the FRUs with the specified FRU display name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Monitor Name**

Selects information about all the FRUs with the specified monitor name.

**[-model <text>] - Model Type**

Selects information about all the FRUs with the specified FRU model.

**[-shared {shared|not\_shared}] - Shared Resource**

Selects information about all the FRUs with the specified sharing type.

**[-chassis-id <text>] - Chassis ID**

Selects information about all the FRUs in the specified chassis.

**[-additional-info <text>] - Additional Information About the FRU**

Selects information about all the FRUs with the specified additional information.

**[-connected-nodes {<nodename>|local}] - List of Nodes Sharing the FRU**

Selects information about all the FRUs with the specified node list.

**[-num-nodes <integer>] - Number of Nodes Sharing the FRU**

Selects information about all the FRUs with the specified number of connected nodes.

## Examples

The following example displays information about all major chassis specific FRUs in the cluster:

```
cluster1::> system chassis fru show
```

Chassis ID	FRU	Type	State	Nodes Sharing the FRU
4591227214	node1	controller	ok	node1
4591227214	node2	controller	ok	node2
4591227214	PSU1 FRU	psu	GOOD	node1,node2
4591227214	PSU2 FRU	psu	GOOD	node1,node2

The following example displays detailed information about a specific FRU:

```
cluster1::> system chassis fru show -instance -fru-name "PSU1 FRU"
Node: node1
```

```
FRU Serial Number: XXT122737891
FRU Name: PSU1 FRU
FRU Type: psu
FRU Name: XXT122737891
FRU State: GOOD
Status: ok
```

```
Display Name for the FRU: PSU1 FRU
Monitor Name: chassis
Model Type: none
Shared Resource: shared
Chassis ID: 4591227214
Additional Information About the FRU: Part Number: 114-00065+A0
Revision: 020F
Manufacturer: NetApp
FRU Name: PSU
List of Nodes Sharing the FRU: node1,node2
Number of Nodes Sharing the FRU: 2
```

## system configuration backup copy

Copy a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system configuration backup copy** command copies a configuration backup from one node in the cluster to another node in the cluster.

Use the [system configuration backup show](#) command to display configuration backups to copy.

### Parameters

**-from-node {<nodename>|local} - Source Node**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

**-backup <text> - Backup Name**

Use this parameter to specify the name of the configuration backup file to copy.

**-to-node {<nodename>|local} - Destination Node**

Use this parameter to specify the name of the destination node where the configuration backup copy is created.

### Examples

The following example copies the configuration backup file **node1.special.7z** from the node **node1** to the node **node2**.

```
cluster1::*> system configuration backup copy -from-node node1 -backup
node1.special.7z -to-node node2
```

```
[Job 295] Job is queued: Copy backup job.
```

## Related Links

- [system configuration backup show](#)

# system configuration backup create

Create a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup create` command creates a new configuration backup file.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which to create the backup file.

**[-backup-name <text>] - Backup Name**

Use this parameter to specify the name of the backup file to create. The backup name cannot contain a space or any of the following characters: \* ? /

**[-backup-type {node|cluster}] - Backup Type**

Use this parameter to specify the type of backup file to create.

## Examples

The following example creates a new cluster configuration backup file called `node1.special.7z` on the node `node1`.

```
cluster1::*> system configuration backup create -node node1 -backup-name  
node1.special.7z -backup-type cluster  
[Job 194] Job is queued: Cluster Backup OnDemand Job.
```

# system configuration backup delete

Delete a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration backup delete** command deletes a saved configuration backup.

Use the [system configuration backup show](#) command to display saved configuration backups.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

**-backup <text> - Backup Name**

Use this parameter to specify the name of the configuration backup file to delete.

## Examples

The following example shows how to delete the configuration backup file **node1.special.7z** from the node **node1**.

```
cluster1::*> system configuration backup delete -node node1 -backup node1.special.7z
```

## Related Links

- [system configuration backup show](#)

# system configuration backup download

Download a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration backup download** command copies a configuration backup from a source URL to a node in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the name of the node to which the configuration backup is downloaded.

**-source <text> - Source URL**

Use this parameter to specify the source URL of the configuration backup to download.

**[-backup-name <text>] - Backup Name**

Use this parameter to specify a new local file name for the downloaded configuration backup.

**[-validate-certificate {true|false}] - Validate Digital Certificate**

Use this parameter with the value **true** to validate the digital certificate of the remote server.

## Examples

The following example shows how to download a configuration backup file from a URL to a file named **exampleconfig.download.7z** on the node **node2**.

```
cluster1::*> system configuration backup download -node node2 -source
http://www.example.com/config/download/nodeconfig.7z -backup-name
exampleconfig.download.7z
```

# system configuration backup rename

Rename a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration backup rename** command changes the file name of a configuration backup file.

Use the [system configuration backup show](#) command to display configuration backups to rename.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

**-backup <text> - Backup Name**

Use this parameter to specify the name of the configuration backup file to rename.

**-new-name <text> - New Name**

Use this parameter to specify a new name for the configuration backup file.

## Examples

The following example renames the saved configuration file `download.config.7z` on the node `node1` to `test.config.7z`.

```
cluster1::*> system configuration backup rename -node node1 -backup download.config.7z
-new-name test.config.7z
```

- [system configuration backup show](#)

# system configuration backup show

Show configuration backup information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup show` command displays information about saved configuration backups.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

Selects configuration backups that are saved on the node you specify.

`[-backup <text>] - Backup Name`

Selects configuration backups that have the backup name you specify.

`[-backup-type {node|cluster}] - Backup Type`

Selects configuration backups of the type you specify.

`[-time <MM/DD HH:MM:SS>] - Backup Creation Time`

Selects configuration backups that were saved on the date and time you specify.

**[-cluster-name <text>] - Cluster Name**

Selects configuration backups that were saved in the cluster that has the name you specify.

**[-cluster-uuid <UUID>] - Cluster UUID**

Selects configuration backups that were saved in the cluster that has the UUID you specify.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Backup**

Selects configuration backups that have the file size you specify.

**[-nodes-in-backup {<nodename>|local}] - Nodes In Backup**

Selects configuration backups that include the configuration of the nodes you specify.

**[-version <text>] - Software Version**

Selects configuration backups that have the software version you specify.

**[-is-auto {true|false}] - Backup Created from Schedule (true or false)**

A value of true selects configuration backups that were created from a schedule. A value of false selects configuration backups that were created manually.

**[-schedule <text>] - Name of Backup Schedule**

Selects configuration backups that were created by the schedule you specify.

## Examples

The following example shows typical output for this command.

```
cluster1::*> system configuration backup show
Node      Backup Tarball                               Time           Size
-----
node1     cluster1.8hour.2011-02-22.18_15_00.7z       02/22 18:15:00  7.78MB
node1     cluster1.8hour.2011-02-23.02_15_00.7z       02/23 02:15:00  7.98MB
node1     cluster1.8hour.2011-02-23.10_15_00.7z       02/23 10:15:00  7.72MB
node1     cluster1.daily.2011-02-22.00_10_00.7z       02/22 00:10:00  7.19MB
node1     cluster1.daily.2011-02-23.00_10_00.7z       02/23 00:10:00  7.99MB
Press <space> to page down, <return> for next line, or 'q' to quit... q
5 entries were displayed.
```

# system configuration backup upload

Upload a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration backup upload** command copies a configuration backup from a node in the cluster to a remote URL.

the web server to which you are uploading the configuration backup file must have PUT operations enabled for HTTP and POST operations enabled for HTTPS. Some web servers may require the installation of an additional module. For more information, see your web server's documentation.

## Parameters

### **-node** {<nodename>|local} - Node

Use this parameter to specify the name of the node from which the configuration backup is uploaded.

### **-backup** <text> - Backup Name

Use this parameter to specify the file name of the configuration backup to upload.

### **-destination** <text> - Destination URL

Use this parameter to specify the destination URL of the configuration backup.

### **[-validate-certificate** {true|false}] - Validate Digital Certificate

Use this parameter with the value **true** to validate the digital certificate of the remote server.

## Examples

The following example show how to upload the configuration backup file **testconfig.7z** from the node **node2** to a remote URL.

```
cluster1::*> system configuration backup upload -node node2 -backup testconfig.7z
-destination ftp://www.example.com/config/uploads/testconfig.7z
```

# system configuration backup settings clear-password

Clear password for destination URL

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The ``system configuration backup settings clear-password`` command clears the password used for uploads of configuration backups. Enter the command without parameters.

Use the [system configuration backup settings show](#) command to display the destination URL for configuration backups. Use the [system configuration backup settings modify](#) command to change the destination URL and remote username for configuration backups.

## Parameters

## Examples

The following example shows successful execution of this command.

```
cluster1::*> system configuration backup settings clear-password  
  
Do you want to clear the password? {y|n}:
```

## Related Links

- [system configuration backup settings show](#)
- [system configuration backup settings modify](#)

# system configuration backup settings modify

Modify configuration backup settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup settings modify` command changes settings for configuration backup.

## Parameters

### `[-destination <text>]` - Backup Destination URL

Use this parameter to specify the destination URL for uploads of configuration backups. Use the value "" to remove the destination URL. Only FTP, HTTP, HTTPS, TFTP, FTPS protocols are supported.

### `[-username <text>]` - Username for Destination

Use this parameter to specify the user name to use to log in to the destination system and perform the upload. Use the [system configuration backup settings set-password](#) command to change the password used with this user name.

**[-validate-certificate {true|false}] - Validate Digital Certificate**

Use this parameter with the value **true** to validate the digital certificate of the remote server. Digital certificate validation is disabled by default.

**[-numbackups1 <integer>] - Number of Backups to Keep for Schedule 1**

Use this parameter to specify the number of backups created by backup job schedule 1 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed. Schedule 1 is pre-programmed to be '8hour'.

**[-numbackups2 <integer>] - Number of Backups to Keep for Schedule 2**

Use this parameter to specify the number of backups created by backup job schedule 2 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed. Schedule 2 is pre-programmed to be 'daily'.

**[-numbackups3 <integer>] - Number of Backups to Keep for Schedule 3**

Use this parameter to specify the number of backups created by backup job schedule 3 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed. Schedule 3 is pre-programmed to be 'weekly'.

## Examples

The following example shows how to set the destination URL and user name used for uploads of configuration backups.

```
cluster1::*> system configuration backup settings modify -destination  
ftp://www.example.com/config/uploads/ -username admin
```

## Related Links

- [system configuration backup settings set-password](#)

# system configuration backup settings set-password

Modify password for destination URL

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration backup settings set-password** command sets the password used for uploads of configuration backups. This password is used along with the username you specify using the [system configuration backup settings modify](#) command to log in to the system and perform the upload. Enter the command without parameters. The command prompts you for a password, and for

a confirmation of that password. Enter the same password at both prompts. The password is not displayed.

Use the [system configuration backup settings show](#) command to display the destination URL for configuration backups. Use the [system configuration backup settings modify](#) command to change the destination URL and remote username for configuration backups.

## Parameters

## Examples

The following example shows successful execution of this command.

```
cluster1::*> system configuration backup settings set-password
```

```
Enter the password:
```

```
Confirm the password:
```

## Related Links

- [system configuration backup settings modify](#)
- [system configuration backup settings show](#)

# system configuration backup settings show

Show configuration backup settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration backup settings show** command displays current settings for configuration backup. These settings apply to backups created automatically by schedules. By default, the command displays the URL to which configuration backups are uploaded, and the user name on the remote system used to perform the upload.

Use the [system configuration backup settings set-password](#) command to change the password used with the user name on the destination. Use the [system configuration backup settings modify](#) command to change the destination URL and username for uploads of configuration backups, and to change the number of backups to keep for each schedule.

## Parameters

**[ -instance ]**

Use this parameter to display detailed information about configuration backup settings, including the number of backups to keep for each backup schedule.

## Examples

The following example displays basic backup settings information.

```
cluster1::*> system configuration backup settings show
Backup Destination URL                               Username
-----
ftp://www.example.com/config/uploads/                jdoe
```

The following example shows detailed output using the **-instance** parameter.

```
cluster1::*> system configuration backup settings show -instance
      Backup Destination URL: ftp://www.example.com/config/uploads/
      Username for Destination: admin
      Validate Digital Certificate: true
      Schedule 1: 8hour
Number of Backups to Keep for Schedule 1: 2
      Schedule 2: daily
Number of Backups to Keep for Schedule 2: 2
      Schedule 3: weekly
Number of Backups to Keep for Schedule 3: 2
```

# system configuration recovery cluster modify

Modify cluster recovery status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration recovery cluster modify** command modifies the cluster recovery status. This command should be used to end the cluster recovery after all recovery procedures are applied.

## Parameters

### `[-recovery-status {complete|in-progress|not-in-recovery}]` - Cluster Recovery Status

Use this parameter with the value **complete** to set the cluster recovery status after the cluster has been recreated and all of the nodes have been rejoined to it. This enables each node to resume normal system operations. The **in-progress** and **not-in-recovery** values are not applicable to this command.

## Examples

The following example modifies the cluster recovery status.

```
source::> system configuration recovery cluster modify -recovery-status complete
```

# system configuration recovery cluster recreate

Recreate cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration recovery cluster recreate** command re-creates a cluster, using either the current node or a configuration backup as a configuration template. After you re-create the cluster, rejoin nodes to the cluster using the [system configuration recovery cluster rejoin](#) command.

## Parameters

### `-from {node|backup}` - From Node or Backup

Use this parameter with the value **node** to re-create the cluster using the current node as a configuration template. Use this parameter with the value **backup** to re-create the cluster using a configuration backup as a configuration template.

### `[-backup <text>]` - Backup Name

Use this parameter to specify the name of a configuration backup file to use as a configuration template. If you specified the **-from** parameter with the value **backup**, you must use this parameter and specify a backup name. Use the [system configuration backup show](#) command to view available configuration backup files.

## Examples

The following example shows how to re-create a cluster using the node **node1** as a configuration template.

```
cluster1::*> system configuration recovery cluster recreate -from node
```

The following example shows how to re-create a cluster using the configuration backup `siteconfig.backup.7z` as a configuration template.

```
cluster1::*> system configuration recovery cluster recreate -from backup -backup
siteconfig.backup.7z
```

## Related Links

- [system configuration recovery cluster rejoin](#)
- [system configuration backup show](#)

# system configuration recovery cluster rejoin

Rejoin a cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration recovery cluster rejoin` command rejoins a node to a new cluster created earlier using the [system configuration recovery cluster recreate](#) command. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

## Parameters

**-node {<nodename>|local} - Node to Rejoin**

Use this parameter to specify the node to rejoin to the cluster.

## Examples

This example shows how to rejoin the node `node2` to the cluster.

```
cluster1::*> system configuration recovery cluster rejoin -node node2
```

```
Warning: This command will rejoin node "node2" into the local cluster,
potentially overwriting critical cluster configuration files. This
command should only be used to recover from a disaster. Do not perform
any other recovery operations while this operation is in progress.
This command will cause node "node2" to reboot.
```

```
Do you want to continue? {y|n}: y
```

## Related Links

- [system configuration recovery cluster recreate](#)

# system configuration recovery cluster show

Show cluster recovery status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration recovery cluster show** command displays the cluster recovery status. Cluster recovery status is "not-in-recovery" under normal operations, and it becomes "in-progress" if a new cluster is created using the [system configuration recovery cluster recreate](#) command with the **-from backup** parameter. When cluster recovery status is "in-progress", wait until the output of the "Is Recovery Status Persisted" field is true before using the [system configuration recovery cluster rejoin](#) command to recover other nodes in the cluster.

## Examples

The following example displays the cluster recovery status.

```
source::> system configuration recovery cluster show
           Recovery Status: in-progress
           Is Recovery Status Persisted: true
```

## Related Links

- [system configuration recovery cluster recreate](#)
- [system configuration recovery cluster rejoin](#)

# system configuration recovery cluster sync

Sync a node with cluster configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration recovery cluster sync** command synchronizes a node with the cluster configuration. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

## Parameters

**-node {<nodename>|local}** - Node to Synchronize

Use this parameter to specify the name of the node to synchronize with the cluster.

## Examples

The following example shows the synchronization of the node **node2** to the cluster configuration.

```
cluster1::*> system configuration recovery cluster sync -node node2
```

```
Warning: This command will synchronize node "node2" with the cluster
configuration, potentially overwriting critical cluster configuration
files on the node. This feature should only be used to recover from a
disaster. Do not perform any other recovery operations while this
operation is in progress. This command will cause all the cluster
applications on node "node2" to restart, interrupting administrative
CLI and Web interface on that node.
```

```
Do you want to continue? {y|n}: y
```

```
All cluster applications on node "node2" will be restarted. Verify that the cluster
applications go online.
```

# system configuration recovery node restore

Restore node configuration from a backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system configuration recovery node restore** command restores the configuration of the local node from a configuration backup file.

Use the [system configuration backup show](#) command to view available configuration backup files.

## Parameters

**-backup <text> - Backup Name**

Use this parameter to specify the name of a configuration backup file to use as the configuration template.

**[-nodename-in-backup <text>] - Use Backup Identified by this Nodename**

Use this parameter to specify a node within the configuration backup file to use as a configuration template. Only specify this parameter if you are specifying a name other than the name of the local node.

**[-force <>true>] - Force Restore Operation**

Use this parameter with the value **true** to force the restore operation and overwrite the current configuration of the local node. This overrides all compatibility checks between the node and the configuration backup. The configuration in the backup is installed even if it is not compatible with the node's software and hardware.

Use this parameter with the value **false** to be warned of the specific dangers of restoring and be prompted for confirmation before executing the command. This value also assures that the command performs compatibility checks between configuration stored in the backup and the software and hardware of the node. The default is **false**.

## Examples

The following example shows how to restore the configuration of the local node from the configuration backup of **node3** that is stored in the configuration backup file **example.backup.7z**.

```
cluster1::*> system configuration recovery node restore -backup example.backup.7z
Warning: This command overwrites local configuration files with files contained
        in the specified backup file. Use this command only to recover from a
        disaster that resulted in the loss of the local configuration files.
        The node will reboot after restoring the local configuration.
Do you want to continue? {y|n}: y
```

# system controller show

Display the controller information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller show** command displays information about all the controllers in the cluster.

These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the controllers in the cluster:

- Controller name
- System ID
- System serial number
- Controller model name
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**[-instance ]}**

Displays detailed information about all the controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the specified controller.

**[-system-id <text>] - System ID**

Selects information about the controller with the specified System ID.

**[-model <text>] - Model Name**

Selects information about the controllers with the specified model name.

**[-part-number <text>] - Part Number**

Selects information about the controllers with the specified part number.

**[-revision <text>] - Revision**

Selects information about the controllers with the specified revision.

**[-serial-number <text>] - Serial Number**

Selects information about the controller with the specified system serial number.

**[-controller-type <text>] - Controller Type**

Selects information about the controllers with the specified controller type.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the controllers with the specified health monitor status.

**[-chassis-id <text>] - Chassis ID**

Selects information about the controllers with the specified chassis ID.

## Examples

The below example displays information about all controllers in the cluster.

```
cluster1::> system controller show
  Controller Name      System ID      Serial Number   Model   Status
  -----
node1                 140733730268652  700001456939   FAS2520  ok
node2                 140733730268667  700001456941   FAS2520  ok
2 entries were displayed.
```

The example below displays detailed information about specified controller in the cluster.

```
cluster1::> system controller show -instance -node node1
      Node: node1
      System ID: 140733730268652
      Model Name: FAS2520
      Part Number: 111-01316
      Revision: 21
      Serial Number: 700001456939
      Controller Type: none
      Status: ok
      Chassis ID: 4591227214
```

## system controller bootmedia show-serial-number

Display the Boot Media Device serial number

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system controller bootmedia show-serial-number** command displays the Boot Media Device serial number. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Serial Number
- Size
- Bootmedia state

- Status

To display more details, use the **-instance** parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

Selects the fields that you specify.

**[ [-instance ] ] }**

Displays detailed information for all the bootmedia devices.

**[-node {<nodename>|local}] - Node**

Selects the bootmedia device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the bootmedia devices with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the bootmedia devices with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the bootmedia devices with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the bootmedia devices with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the bootmedia device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the bootmedia devices with the specified health monitor.

**[-usbmon-status {present|not-present}] - Bootmedia Health Monitor**

Selects the bootmedia devices with the specified USBMON status.

**[-device-state {good|warn|bad}] - Bootmedia State**

Selects the bootmedia devices with the specified device state.

**[-size <integer>] - Max Memory Size (MB)**

Selects the bootmedia devices with the specified memory size.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the bootmedia devices with the specified health monitor status.

## Examples

The following example displays the information of the bootmedia devices present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show-serial-number
```

Node	Display Name	Serial Number	(MB)	State	Status
or-12-01	BootMedia/SAMSUNG MZVLV128HCGR-00000	S2J4NXAGA08186	122104	good	ok
	BootMedia-2/SAMSUNG MZVLV128HCGR-00000	S2J4NXAGA08198	122104	good	ok

2 entries were displayed.

The following example displays the detailed information about the bootmedia present in a node:

```
cluster1::> system controller bootmedia show-serial-number -instance -node node1
Node: node1
    Vendor ID: 8086
    Device ID: 8d02
    Display Name: TOSHIBA THNSNJ060GMCU
    Unique Name: /dev/ad4s1 (TOSHIBA THNSNJ060GMCU)
    Health Monitor Name: controller
Bootmedia Health Monitor: present
    Bootmedia State: good
    Max memory size(in MB): 16367
    Status: ok
    Serial number: Y4IS104FTNEW
```

## system controller bootmedia show

Display the Boot Media Device Health Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller bootmedia show** command displays details of the bootmedia devices present in all the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name

- Display name
- Vendor ID
- Device ID
- Memory size
- Bootmedia state
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**[-instance ]}**

Displays detailed information for all the bootmedia devices.

**[-node {<nodename>|local}] - Node**

Selects the bootmedia device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the bootmedia devices with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the bootmedia devices with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the bootmedia devices with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the bootmedia devices with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the bootmedia device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the bootmedia devices with the specified health monitor.

**[-usbmon-status {present|not-present}] - Bootmedia Health Monitor**

Selects the bootmedia devices with the specified USBMON status.

**[-device-state {good|warn|bad}] - Bootmedia State**

Selects the bootmedia devices with the specified device state.

**[-size <integer>] - Max Memory Size (MB)**

Selects the bootmedia devices with the specified memory size.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the bootmedia devices with the specified health monitor status.

## Examples

The following example displays the information of the bootmedia devices present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show
Size Bootmedia
Node          Display Name          Vendor ID Device ID  (MB) State  Status
-----
node1         Micron Technology     634      655    1929 good   ok
              0x655
node2         Micron Technology     634      655    1929 good   ok
              0x655
```

The example below displays the detailed information about the bootmedia present in a node.

```
cluster1::> system controller bootmedia show -instance -node node1
Node: node1
      Vendor ID: 634
      Device ID: 655
      Display Name: Micron Technology 0x655
      Unique Name: Micron Technology 0x655 (ad.0)
      Health Monitor Name: controller
      USBMON Health Monitor: present
      Bootmedia State: good
      Max memory size(in MB): 1929
      Status: ok
```

## system controller clus-flap-threshold show

Display the controller cluster port flap threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller clus-flap-threshold show** command allows the display of the threshold for link flapping counts for all nodes. This threshold would be the number of times the cluster port links for a given node can flap (go down) within a polling period before triggering an alert.

# system controller config show-errors

Display configuration errors

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller config show-errors` displays configuration errors.

- node
- description

To display more details, use the `-instance` parameter.

## Parameters

`{ [-fields <fieldname>, ... ] }`

Selects the fields that you specify.

`[ -instance ] }`

Displays detailed information for all the PCI devices.

`[ -node {<nodename>|local} ] - Node`

Displays configuration errors on the specified node.

`[ -verbose <true> ] - Verbose Output?`

The `-verbose` parameter enables verbose mode, resulting in the display of more detailed output.

`[ -description <text> ] - Error Description`

Displays the node with the specified configuration error.

## Examples

The example below displays configuration errors on all the nodes in the cluster.

```
cluster1::> system controller config show-errors

Configuration Info and Errors for Node: cluster1-01
-----
Chelsio T320E 2x10G NIC card (PN X1008A) in slot 1 is not supported on model FAS3210

Configuration Info and Errors for Node: cluster1-02
-----
PCI-E Dual 10/100/1000 Ethernet G20 card (PN X1039A) in slot 2 is not supported on
model FAS3210
```

```
cluster1::>

cluster1::> system controller config show-errors -verbose

Configuration Info and Errors for Node: cluster1-01
-----
sysconfig: Card in slot 2 (7-1275-0008-46848) is not supported.
sysconfig: slot 12 OK: X2067: Proprietary embedded SAS HBA

cluster1::>
```

# system controller config show

## Display System Configuration Information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller config show** command displays system configuration information for the devices present in the controller. To display more details, use the **-instance** parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value.

**[-device <text>] - Device**

Selects the configuration information that matches the specified device.

**[-subslot <integer>] - Subslot Number**

Selects the configuration information that matches the specified subslot.

**[-info <text>] - Device Info**

Selects the configuration information that matches the specified device information.

**[-slot <text>] - Slot**

Selects the configuration information that matches the specified slot.

## Examples

The following example displays configuration information for slot 1 of the controller:

```
cluster1::> system controller config show -slot 1

Node: node1
Sub- Device/
Slot slot Information
-----
  1   - NVRAM10 HSL
      Device Name:      Interconnect HBA: Generic OFED Provider
      Port Name:        ib1a
      Default GUID:     fe80:0000:0000:0000:0000:0000:0000:0104
      Base LID:         0x104
      Active MTU:       8192
      Data Rate:        0 Gb/s (8X)
      Link State:       DOWN
      QSFP Vendor:      Amphenol
      QSFP Part Number: 112-00436+A0
      QSFP Type:        Passive Copper 1m ID:00
      QSFP Serial Number: APF16130066875
      QSFP Vendor:      Amphenol
      QSFP Part Number: 112-00436+A0
      QSFP Type:        Passive Copper 1m ID:00
      QSFP Serial Number: APF16130066857

cluster1::>
```

# system controller config pci show-add-on-devices

Display PCI devices in expansion slots

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller config pci show-add-on-devices** command displays information about the PCIe devices in I/O expansion slots. The command displays the following information about the PCIe devices:

- Node

- Model
- Type
- Slot
- Device
- Vendor
- Sub-device ID

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**[ [-instance ] ]**

Displays detailed information about PCI devices.

**[-node {<nodename>|local}] - Node**

Selects the PCI devices that are present in the specified node.

**[-model <text>] - Model String**

Selects the PCI devices that are present on the system with the specified model name.

**[-type <integer>] - Device Type**

Selects the PCI devices with the specified device type.

**[-slot-and-sub <text>] - PCI Slot Number**

Selects the PCI devices present in the specified slot or slot-subslot combination.

**[-device <text>] - Device**

Selects the PCI devices with the specified device ID.

**[-vendor <text>] - Vendor Number**

Selects the PCI devices with the specified vendor ID.

**[-sub-device-id <integer>] - Sub Device ID**

Selects the PCI devices with the specified sub-device ID.

## Examples

The example below displays information about PCI devices found in I/O expansion slots of all the nodes in the cluster.

```
cluster1::> system controller config pci show-add-on-devices
Node           Model           Slot Type Device  Vendor Sub-Device ID
```

```

## system controller config pci show-hierarchy

Display PCI hierarchy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system controller config pci show-hierarchy** command displays the PCI Hierarchy of all PCI devices found in a controller. The command displays the following information about the PCI devices:

- Node
- Level
- Device
- Link Capability
- Link Status

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>, ...]**

Selects the fields that you specify.

**! [-instance ] }**

Displays detailed information for PCI devices.

**[-node {<nodename>|local}] - Node**

Displays the PCI hierarchy of the specified node.

**[-level <integer>] - PCI Device Level**

Displays the PCI devices that match the specified level within the PCI hierarchy.

**[-pci-device <text>] - PCI Device**

Displays the PCI devices that match the specified device description.

**[-link-cap <text>] - Link Capability**

Displays the PCI devices that match the specified link capability.

**[-link-status <text>] - Link Status**

Displays the PCI devices that match the specified link status.

## Examples

The example below displays the PCI hierarchy for all of the nodes in the cluster.

```
cluster1::> system controller config pci show-hierarchy
PCI Hierarchy

Node: cluster1-01

## system controller coredump-device show-serial-number

Display the coredump device serial number

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system controller coredump-device show-serial-number** command displays the serial number of coredump devices. This command is only applicable to AFF A700 systems. By default, the command displays the following information about the coredump device:

- Node name
- Display name
- Serial number
- Size
- Device state
- Status

To display more details, use the **-instance** parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**[-instance ]}**

Displays detailed information for the coredump device.

**[-node {<nodename>|local}] - Node**

Selects the coredump device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the coredump device with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the coredump device with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the coredump device with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the coredump device with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the coredump device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the coredump device with the specified health monitor.

**[-health-status {present|not-present}] - Health Status**

Selects the coredump device with the specified health status.

**[-device-state {good|warn|bad}] - Device State**

Selects the coredump device with the specified device state.

**[-size <integer>] - Max Memory Size (GB)**

Selects the coredump device with the specified memory size.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the coredump device with the specified health monitor status.

**[-shelf-status {present|not-present}] - Shelf Connected Status**

Selects the coredump device with the specified shelf connected status.

## Examples

The following example displays the information of the coredump device present in all the nodes in a cluster:

```
cluster1::> system controller coredump-device show-serial-number
Size Device
Node      FRU/Display Name      Serial Number      (GB) State      Status
-----
cluster1-01
          Coredump/X9170A      A22P5061550000644  1024 good      ok
cluster1-02
          Coredump/X9170A      A22P5061550000137  1024 good      ok
2 entries were displayed.
```

The following example displays the detailed information about the coredump device present in a node:

```
cluster1::> system controller coredump-device show-serial-number -instance -node
cluster1-01
Node: cluster1-01
      Serial Number: A22P5061550000644
          Vendor ID: 1b85
          Device ID: 4018
      Display Name: Coredump/X9170A
          Unique Name: 0X917011900207410CZ000Z63000001T0003500
      Health Monitor Name: controller
          Health Status: present
          Device State: good
      Max Memory Size (GB): 1024
          Status: ok
      Shelf Connected Status: present
```

## system controller coredump-device show

Display the coredump device health status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller coredump-device show** command displays details of the coredump devices present in all the nodes in a cluster. This command is only applicable to AFF A700 systems. By default, the command displays the following information about the coredump device:

- Node name

- Display name
- Vendor ID
- Device ID
- Memory size
- Device state
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**[-instance ]}**

Displays detailed information for the coredump device.

**[-node {<nodename>|local}] - Node**

Selects the coredump device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the coredump device with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the coredump device with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the coredump device with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the coredump device with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the coredump device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the coredump device with the specified health monitor.

**[-health-status {present|not-present}] - Health Status**

Selects the coredump device with the specified health status.

**[-device-state {good|warn|bad}] - Device State**

Selects the coredump device with the specified device state.

**[-size <integer>] - Max Memory Size (GB)**

Selects the coredump device with the specified memory size.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the coredump device with the specified health monitor status.

**[-shelf-status {present|not-present}] - Shelf Connected Status**

Selects the coredump device with the specific shelf connected status.

## Examples

The following example displays the information of the coredump devices present in all the nodes in a cluster:

```
cluster1::> system controller coredump-device show
Size Device
Node      FRU/Display Name      Vendor ID Device ID      (GB) State      Status
-----
cluster1-01
          Coredump/X9170A      1b85      4018      1024 good      ok
cluster1-02
          Coredump/X9170A      1b85      4018      1024 good      ok
2 entries were displayed.
```

The example below displays the detailed information about the coredump device present in a node.

```
cluster1::> system controller coredump-device show -instance -node cluster1-01
Node: cluster1-01
  Serial Number: A22P5061550000644
  Vendor ID: 1b85
  Device ID: 4018
  Display Name: Coredump/X9170A
  Unique Name: 0X917011900207410CZ000Z63000001T0003500
  Health Monitor Name: controller
  Health Status: present
  Device State: good
  Max Memory Size (GB): 1024
  Status: ok
  Shelf Connected Status: present
```

## system controller environment show

Display the FRUs in the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller environment show** displays information about all environment FRUs in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the environment FRUs in the cluster:

- Node
- FRU name
- FRU state

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

Selects the fields that you specify.

**[ -instance ] }**

Displays detailed information about the environment FRUs.

**[ -node {<nodename>|local} ] - Node**

Selects information about all the environment FRUs that the specified node owns.

**[ -serial-number <text> ] - FRU Serial Number**

Selects information about all the environment FRUs with the specified serial number.

**[ -fru-name <text> ] - FRU Name**

Selects information about the environment FRU with the specified FRU name.

**[ -type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdim} ] - FRU Type**

Selects information about all the environment FRUs with the specified FRU type.

**[ -name <text> ] - Name**

Selects information about all the environment FRUs with the specified unique name.

**[ -state <text> ] - FRU State**

Selects information about all the environment FRUs with the specified FRU state.

**[ -status {ok|ok-with-suppressed|degraded|unreachable|unknown} ] - Status**

Selects information about all the environment FRUs with the specified health monitor status.

**[ -display-name <text> ] - Display Name for the FRU**

Selects information about all the environment FRUs with the specified display name.

**[ -monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch} ] - Monitor Name**

Selects information about all the environment FRUs with the specified monitor.

**[-model <text>] - Model Type**

Selects information about all the environment FRUs with the specified FRU model.

**[-shared {shared|not\_shared}] - Shared Resource**

Selects information about all the environment FRUs with the specified sharing type.

**[-chassis-id <text>] - Chassis ID**

Selects information about all the environment FRUs in the specified chassis.

**[-additional-info <text>] - Additional Information About the FRU**

Selects information about all the environment FRU with specified additional information.

**[-seq-state-cnt <integer>] - Count of Same State**

Selects information about all the environment FRU with specified sequential state count.

## Examples

The following example displays information about all major environment FRUs in the cluster:

```
cluster1::> system controller environment show
```

Node	FRU Name	State
node1	PSU1 FRU	GOOD
node1	PSU2 FRU	GOOD
node2	PSU1 FRU	GOOD
node2	PSU2 FRU	GOOD

The following example displays detailed information about a specific environment FRU:

```
cluster1::> system controller environment show -node node1 -fru-name "PSU1 FRU"
-instance
```

```
Node: node1
```

```
FRU Serial Number: XXT122737891
```

```
FRU Name: PSU1 FRU
```

```
FRU Type: psu
```

```
Name: XXT122737891
```

```
FRU State: GOOD
```

```
Status: ok
```

```
Display Name for the FRU: PSU1 FRU
```

```
Monitor Name: controller
```

```
Model Type: none
```

```
Shared Resource: shared
```

```
Chassis ID: 4591227214
```

```
Additional Information About the FRU: Part Number: 114-00065+A0
```

```
Revision: 020F
```

Manufacturer: NetApp  
FRU Name: PSU

# system controller flash-cache show

Display the Flash Cache device status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller flash-cache show` command displays the current Flash Cache device information.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

If this parameter is specified, only status information for the matching node is displayed.

`[-device-id <integer>] - Device ID`

If this parameter is specified, only status information for the matching device-id is displayed.

`[-slot <integer>] - Slot`

If this parameter is specified, only status information for the matching slot is displayed. Slot can have a format of slot, slot-subslot, or domain:bus:slot.

`[-subslot <integer>] - Subslot`

If this parameter is specified, only status information for the matching subslot is displayed.

`[-domain <integer>] - Domain`

If this parameter is specified, only status information for the matching PCI domain is displayed.

`[-bus <integer>] - Bus`

If this parameter is specified, only status information for the matching PCI bus is displayed.

`[-slot-string <text>] - Slot String`

If this parameter is specified, only status information for the matching slot is displayed. Format can be slot or slot-subslot.

**[-device-state****{ok|erasing|erased|failed|removed|online|offline\_failed|degraded|offline\_threshold}] - Device State**

If this parameter is specified, only status information for the matching device-state is displayed.

**[-model-number <text>] - Model Number**

If this parameter is specified, only status information for the matching model-number is displayed.

**[-part-number <text>] - Part Number**

If this parameter is specified, only status information for the matching part-number is displayed.

**[-serial-number <text>] - Serial Number**

If this parameter is specified, only status information for the matching serial-number is displayed.

**[-firmware-version <text>] - Firmware Version**

If this parameter is specified, only status information for the matching firmware-version is displayed.

**[-firmware-file <text>] - Firmware Filename**

If this parameter is specified, firmware-file is the base name of the firmware file located in disk\_fw to update the device firmware.

**[-hardware-revision <text>] - Hardware Revision**

If this parameter is specified, only status information for the matching hardware-revision is displayed.

**[-capacity <integer>] - Capacity**

If this parameter is specified, only status information for the matching capacity is displayed.

**[-last-change-time <integer>] - Time Last State Change**

If this parameter is specified, only status information for the matching last-change-time is displayed.

**[-service-time <integer>] - Service Time**

If this parameter is specified, only status information for the matching service-time is displayed.

**[-percent-online <integer>] - Percent Online**

If this parameter is specified, only status information for the matching percent-online is displayed.

**[-average-erase-cycle-count <integer>] - Avg Erase Cycle Count**

If this parameter is specified, only status information for the matching average-erase-cycle-count is displayed.

**[-threshold-profile <text>] - Threshold Profile**

If this parameter is specified, only status information for the matching threshold-profile is displayed.

## Examples

The following example displays the current state of all Flash Cache devices:

```
cluster1::> system controller flash-cache show
Node      Device ID      Model Part      Serial Number      Firmware Version      Capacity (GB)      Device State
-----
node1
          0 6-1 X9172A 119-00209 A22P7061550000004 NA00      4096 ok
          1 6-2 X9170A 119-00207 A22P5061550000135 NA00      1024 ok
node2
          0 6-1 X9172A 119-00209 A22P7061550000007 NA00      4096 ok
          1 6-2 X9170A 119-00207 A22P5061550000091 NA00      1024 ok
4 entries were displayed.
```

## system controller flash-cache secure-erase run

Perform a secure-erase operation on the targeted devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller flash-cache secure-erase run** command securely erases the given Flash Cache device.

## Parameters

**-node {<nodename>|local} - Node**

Selects the node of the specified Flash Cache devices.

**-device-id <integer> - Device Id**

Selects the device-id of the specified Flash Cache devices.

## Examples

The following example securely erases the selected Flash Cache device:

```
cluster1::> system controller flash-cache secure-erase -node node1 -device-id 0
```

# system controller flash-cache secure-erase show

Display the Flash Cache card status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller flash-cache secure-erase show` command displays the current Flash Cache device secure-erase status.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ -instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[ -node {<nodename>|local} ] - Node`

If this parameter is specified, only status information for the matching node is displayed.

`[ -device-id <integer> ] - Device Id`

If this parameter is specified, only status information for the matching device-id is displayed.

`[ -device-state {ok|erasing|erased|failed|removed} ] - Device State`

If this parameter is specified, only status information for the matching device-state is displayed.

## Examples

The following example displays the current state of all the Flash Cache devices:

```
cluster1::> system controller flash-cache secure-erase show
Node      Device ID Slot Device State
-----
node1
          0 6-1  ok
          1 6-2  erasing
node2
          0 6-1  erased
          1 6-2  ok
```

4 entries were displayed.

# system controller fru show-manufacturing-info

Display manufacturing information of FRUs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller fru show-manufacturing-info** command displays manufacturing information for field replaceable units (FRUs) installed in the system. The information includes FRU-description, serial number, part number, and revision number. To display more details, use the **-instance** parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

Displays detailed information about the installed FRUs in the system.

**[ -node {<nodename>|local} ] - Node**

Selects a specific node's installed FRUs.

**[ -system-sn <text> ] - System Serial Number**

Selects information about installed FRUs with the specified system serial number.

**[ -model-name <text> ] - Model Name**

Selects information about installed FRUs with the specified model name.

**[ -system-id <text> ] - System ID**

Selects information about installed FRUs with the specified system ID.

**[ -kernel-version <text> ] - Kernel Version**

Selects information about installed FRUs with the specified kernel version.

**[ -firmware-release <text> ] - Firmware Release**

Selects information about installed FRUs with the specified firmware release.

**[ -description <text> ] - FRU Description**

Selects information about installed FRUs with the specified FRU description.

**[-vendor-id <text>] - FRU Vendor ID**

Selects information about the FRU with the vendor identification.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-part-number <text>] - FRU Part Number**

Selects information about the FRU with the specified part number.

**[-revision <text>] - FRU Revision of Part Number**

Selects information about the FRU with the specified revision.

**[-manufacturer <text>] - FRU Manufacturer**

Selects information about the FRU with the specified manufacturer.

**[-manufacture-date <text>] - FRU Manufacturing Date**

Selects information about the FRU with the specified manufacture date.

**[-product-id <text>] - FRU Product Identifier**

Selects information about the FRU with the specified product ID.

**[-firmware-version <text>] - FRU Firmware Version**

Selects information about the FRU with the specified firmware version.

## Examples

The following example displays all installed FRUs in the system:

```
//cluster1::> system controller fru show-manufacturing-info
//Node: platsw-lodi-1-01
//System Serial Number: 791541000047
//      Model Name: FAS9040
//      System ID: 0537024373
//      Firmware release: 10.0X18
//      Kernel Version: NetApp Release sysMman_3887886_1608151712: Mon Aug 15
//                        15:54:00 PDT 2016

## system controller fru show

Display Information About the FRUs in the Controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system controller fru show** command displays information about all the controller specific Field Replaceable Units (FRUs) in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the FRUs in the cluster:

- Node
- FRU name
- Health monitor subsystem
- Health monitor status

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>, ... ] }**

Selects the fields that you specify.

**[ [-instance ] ] }**

Displays detailed information about the controller specific FRUs in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the FRUs in the specified node.

**[-subsystem <Subsystem>] - Subsystem**

Selects information about the FRUs of the specified subsystem.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-fru-name <text>] - Name of the FRU**

Selects information about the FRU with the specified FRU name.

**[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type**

Selects information about the FRU with the specified FRU type.

**[-name <text>] - FRU Name**

Selects information about the FRU with the specified unique name.

**[-state <text>] - FRU State**

Selects information about the FRU with the specified state.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the FRU with the specified health monitor status.

**[-display-name <text>] - Display Name for the Fru**

Selects information about the FRU with the specified display name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Monitor Name**

Selects information about the FRU with the specified health monitor type.

**[-model <text>] - Model Type**

Selects information about the FRU with the specified model.

**[-chassis-id <text>] - Chassis ID**

Selects information about the FRU with the specified chassis ID.

**[-location <text>] - Location of the FRU**

Selects information about the FRU with the specified FRU location.

**[-additional-info <text>] - Additional Information About the FRU**

Selects information about the FRU with the specified additional information.

## Examples

The example below displays information about all controller specific FRUs in the cluster.

```
cluster1::> system controller fru show
  Node          FRU Name          Subsystem      Status
  -----
  node1         PSU1 FRU          Environment    ok
  node1         PSU2 FRU          Environment    ok
  node1         DIMM-NV1          Memory         ok
```

```

node1          DIMM-1          Memory          ok
node1          Micron Technology 0x655 (ad.0) Motherboard  ok
node2          PSU1 FRU          Environment      ok
node2          PSU2 FRU          Environment      ok
node2          DIMM-NV1         Memory          ok
node2          DIMM-1          Memory          ok
node2          Micron Technology 0x655 (ad.0) Motherboard  ok
10 entries were displayed.

```

The example below displays information about the specific FRU.

```

cluster1::> system controller fru show -instance -serial-number AD-01-1306-2EA01E9A
                Node: node1
                Subsystem: Memory
                FRU Serial Number: AD-01-1306-2EA01E9A
                Name of the FRU: DIMM-1
                FRU Type: dimm
                FRU Name: DIMM-1
                FRU State: ok
                Status: ok
                Display Name for the Fru: DIMM-1
                Monitor Name: controller
                Model Type: none
                Chassis ID: 4591227214
                Location of the FRU: Memory Slot: 1
                Additional Information About the FRU: Part No: HMT82GV7MMR4A-H9

```

## system controller fru led disable-all

Turn off all the LEDs Data Ontap has lit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system controller fru led disable-all** command turns off all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal

FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

## Examples

Turn off all FRU fault LEDs.

```
cluster1::*> system controller fru led disable-all
14 entries were modified.
```

# system controller fru led enable-all

Light all the LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system controller fru led enable-all** command turns on all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

## Examples

Turn on all FRU fault LEDs.

```
cluster1::*> system controller fru led enable-all
14 entries were modified.
```

# system controller fru led modify

Modify the status of FRU LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system controller fru led modify** command modifies the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs.

Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

## Parameters

### **-node {<nodename>|local} - Node**

Selects FRU fault LEDs on the specified nodes.

### **-fru-id <FRU LED key> - FRU ID**

Selects the FRU fault LEDs that match the specified FRU type.

### **-fru-slot <integer> - FRU Slot**

Selects the FRU fault LEDs that match the specified slot.

### **[-fru-state {on|off|unknown}] - FRU State**

Specifies the target state for the FRU fault LED.

## Examples

Turn off DIMM 3's FRU fault LED.

```
cluster1::*> system controller fru led modify -node node1 -fru-id dimm -fru-slot 3
-fru-state off
```

The example below turns on all PCI FRU fault LEDs.

```
cluster1::*> system controller fru led modify -node node1 -fru-id pci -fru-slot * -fru
-state on
```

- [system controller fru led show](#)

# system controller fru led show

Display the status of FRU LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system controller fru led show** command displays information about the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the **system controller fru led show** command matches that specified on the FRU map label.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects FRU fault LEDs on the specified nodes.

**[-fru-id <FRU LED key>] - FRU ID**

Selects the FRU fault LEDs that match the specified FRU type.

**[-fru-slot <integer>] - FRU Slot**

Selects the FRU fault LEDs that match the specified slot.

**[-fru-bay <text>] - FRU Bay**

Selects the FRU fault LEDs that match the specified bay.

**[-fru-state {on|off|unknown}] - FRU State**

Selects the FRU fault LEDs that match the specified status.

**[-lit-by <text>] - Lit By**

Selects the FRU fault LEDs that were lit by the specified source.

## Examples

List the current state of all FRU fault LEDs.

```
cluster1::*> system controller fru led show
Node                FRU Type   Bay Slot State  Lit By
-----
host1
    controller      A 1    on    SP
    ioxm             B 1    off   -
    pci              - 1    off   -
    pci              - 2    off   -
    pci              - 3    off   -
    pci              - 4    off   -
    pci              - 5    off   -
    pci              - 6    off   -
    dimm-nv          - 1    off   -
    dimm-nv          - 2    off   -
    dimm             - 1    off   -
    dimm             - 2    off   -
    dimm             - 3    off   -
    dimm             - 4    off   -
    identify         - 1    off   -

5 entries were displayed.
```

The example below displays the status of only a specific FRU.

```
cluster1::*> system controller fru led show -node host1 -fru-id controller -fru-slot 1
Node                FRU Type   Bay Slot State  Lit By
-----
host1
    controller      A 1    off   -
```

## system controller hardware-license show

Display hardware license status on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller hardware-license show** command displays information about the controller's hardware license. The command displays the following information:

- Status
- Is Valid?
- Is Permanent?
- Expiration Date

## Examples

The following example displays hardware license status:

```
cluster1::> system controller hardware-license show
Status      Is Valid?  Is Permanent?  Expiration Date
-----
Supported   true       true           -
cluster1::>
```

# system controller hardware-license update

Update hardware license

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system controller hardware-license update** command downloads the hardware license from a specified location and updates the license file. By default, the license will be authenticated and verified against the system serial number and model string of the controller before performing the update of the hardware license. Update won't happen if either of the following happens: authentication fails, the system serial number doesn't match, or the model string doesn't match.

## Parameters

### -package <text> - Package URL

This specifies the location from which the software image is to be downloaded. The location can be specified in any of the following ways:

- As an HTTP URL in the form **http://host\_name:port/path\_to\_file** . For instance, **http://example.com/downloads/license.json** . The management utility prompts you for a user name and password before beginning the download.

If you use HTTP to transfer software images, be aware that the management

utility does not check whether the Web server is password protected; if it is not, press Enter at the prompt for user name and password.

- As an HTTPS URL in the form **https://host\_name:port/path\_to\_file** . For instance, **https://example.com/downloads/license.json** .

The HTTPS URL scheme requires that you install the HTTPS server certificate on the system by using the command "security certificate install -type server-ca".

- As an FTP URL in the form **ftp://host\_name:port/path\_to\_file** . For instance, **ftp://example.com/downloads/license.json** . If required, the management utility prompts you for a user name and password before beginning the download.
- The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as **file://usb0/<filename>** . Typically, the file name is **license.json** . The package must be present in the root directory of the USB mass storage device.

## Examples

The following example downloads license file and install it into the FRU ROM

```
cluster1::*> system controller hardware-license update -package  
http://example.com/license.json
```

# system controller ioxm show

Displays IOXM Device Health Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller ioxm show** command displays the details of the IO expansion modules (IOXMs) that are connected to the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the IOXMs:

- Node name
- Display name
- Is IOXM present?
- Power status
- Health monitor status

To display more details, use the **-instance** parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

Selects the fields that you specify.

**{ [-instance ] }**

Displays detailed information for all the IOXMs.

**{ [-node {<nodename>|local} ] } - Node**

Selects the IOXM that is connected to the specified node.

**{ [-chassis-config {c-i|c-c|c-b} ] } - Controller-IOXM or Controller-Controller or Controller-Blank**

Selects the IOXMs with the specified chassis configuration.

**{ [-is-present {present|not-present} ] } - IOXM Presence**

Selects the IOXMs that are connected and detected (**present** ) or connected but not detected (**not-present** ).

**{ [-power {good|bad} ] } - Power to IOXM**

Selects the IOXMs with the specified power state.

**{ [-display-name <text> ] } - Display Name**

Selects the IOXMs with the specified display name.

**{ [-unique-name <text> ] } - Unique Name**

Selects the IOXM with the specified unique name.

**{ [-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch} ] } - Health Monitor Name**

Selects the IOXMs with the specified health monitor.

**{ [-status {ok|ok-with-suppressed|degraded|unreachable|unknown} ] } - IOXM Health**

Selects the IOXMs with the specified health monitor status.

## Examples

The example below displays the information of all the IOXMs that are connected to the nodes in a cluster.

```
cluster1::> system controller ioxm show
```

Node	Display Name	Is-Present?	Power	Status
node1	IOXM	present	good	ok
node2	IOXM	present	good	ok

The example below displays detailed information of an IOXM that is connected to a node.

```
cluster1::> system controller ioxm show -instance -node node1
Node: node1
Controller-IOXM or Controller-Controller or Controller-Blank: c-i
  IOXM Presence: present
  Power to IOXM: good
  Display Name: node1/IOXM
  Unique Name: 8006459930
Health Monitor Name: controller

```

## system controller location-led modify

Modify the location LED state of a controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system controller location-led modify** command modifies the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

### Parameters

**-node {<nodename>|local} - Node**

Selects the location LED on the specified filers.

**[-state {on|off}] - LED State**

Modifies the state of the location LED on the filer.

### Examples

The following example turns on the location LED:

```
cluster1::*> system controller location-led modify -node node1 -state on
```

Turn off Location LED.

```
cluster1::*> system controller location-led modify -node node1 -state off
```

# system controller location-led show

Display the location LED state on controllers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller location-led show** command shows the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node**

Selects the location LED on the specified filers.

**[ -state {on|off} ] - LED State**

Displays the location LED's status.

## Examples

The following example lists the current state of the location LED:

```
cluster1::*> system controller location-led show
Node           Location LED State
-----
node1          Off
```

```
node2          Off
```

# system controller memory dimm show

Display the Memory DIMM Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller memory dimm show** command displays information about the DIMMs in all the nodes in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the DIMMs in the cluster:

- Node
- DIMM name
- Uncorrectable ECC error count
- Correctable ECC error count
- CECC Alert Method
- CPU socket
- Channel
- Slot number
- Health monitor status
- Failure reason

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**[-instance ]}**

Displays detailed information about the DIMMs in all the controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the DIMMs in the specified node.

**[-pds-id <integer>] - DIMM ID**

Selects information about the DIMMs with the specified DIMM ID.

**[-slotname <text>] - Slot Name**

Selects information about the DIMMs with the specified slot name.

**[-socket <integer>] - CPU Socket**

Selects information about the DIMMs with the specified socket ID.

**[-channel <integer>] - Channel**

Selects information about the DIMMs with the specified channel number.

**[-slot-no <integer>] - Slot Number on a Channel**

Selects information about the DIMMs with the specified slot number.

**[-serial <text>] - Serial Number**

Selects information about the DIMMs with the specified serial number.

**[-part-no <text>] - Part Number**

Selects information about the DIMMs with the specified part number.

**[-cecc-count <integer>] - Correctable ECC Error Count**

Selects information about the DIMMs with the specified correctable ECC error count.

**[-uecc-count <integer>] - Uncorrectable ECC Error Count**

Selects information about the DIMMs with the specified uncorrectable ECC error count.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects information about the DIMMs with the specified health monitor.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the DIMMs with the specified health monitor status.

**[-name <text>] - Unique Name of DIMM**

Selects information about the DIMMs with the specified unique name.

**[-display-name <text>] - Display Name for the DIMM**

Selects information about the DIMMs with the specified display name.

**[-alt-cecc-method <text>] - CECC Alert Method**

Selects information about the DIMMs with the specified CECC error alert method.

**[-alt-cecc-dimm {true|false}] - Replace DIMM**

Selects information about the DIMMs with the specified replace DIMM value.

**[-failure-reason <text>] - Failure Reason**

Selects information about the DIMMs with the specified failure reason.

## Examples

The example below displays information about the DIMMs in all the nodes in the cluster.

```
cluster1::> system controller memory dimm show
```

Failure Reason	Node	DIMM Name	UECC Count	CECC Count	Alert Method	CPU Socket	Channel	Slot Number	Status
disabled	node1	DIMM-1	0	0	bucket	0	0	0	unknown
		DIMM-NV1	0	0	bucket	0	1	1	ok
	node2	DIMM-1	1	0	bucket	0	0	0	ok
	node3	DIMM-NV1	0	0	bucket	0	1	1	ok

4 entries were displayed.

The example below displays detailed information about a specific DIMM in a specific controller.

```
cluster1::> system controller memory dimm show -instance -node node1 -pds-id 1
```

```

Node: node1
DIMM ID: 1
Slot Name: DIMM-1
CPU Socket: 0
Channel: 0
Slot Number on a Channel: 0
Serial Number: AD-01-1306-2EA01E9A
Part Number: HMT82GV7MMR4A-H9
Correctable ECC Error Count: 0
Uncorrectable ECC Error Count: 0
Health Monitor Name: controller
Status: unknown
Unique Name of DIMM: DIMM-1
Display Name for the DIMM: DIMM-1
CECC Alert Method: bucket
Replace DIMM: false
Failure Reason: disabled

```

## system controller nvram-bb-threshold show

Display the controller NVRAM bad block threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller nvram-bb-threshold show** command displays the threshold for the NVRAM bad block counts for a node.

# system controller pci show

Display the PCI Device Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller pci show** command displays details of the PCI devices present in all of the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the PCI devices:

- Node name
- Display name
- Correctable error count
- Functional link width
- Functional link speed
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**[-instance ]}**

Displays detailed information for all of the PCI devices.

**[-node {<nodename>|local}] - Node**

Selects the PCI devices that are present in the specified node.

**[-bus-number <integer>] - Bus Number**

Selects the PCI devices with the specified bus number.

**[-device-number <integer>] - Device Number**

Selects the PCI devices with the specified device number.

**[-function-number <integer>] - Function Number**

Selects the PCI devices with the specified function number.

**[-slot-number <integer>] - Slot Info**

Selects the PCI devices with the specified slot number.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the PCI devices monitored by the specified health monitor.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the PCI devices with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the PCI devices with the specified device ID.

**[-physical-link-width <integer>] - Physical Link Width**

Selects the PCI devices with the specified physical link width.

**[-functional-link-width <integer>] - Functional Link Width**

Selects the PCI devices with the specified functional link width.

**[-physical-link-speed <text>] - Physical Link Speed(GT/s)**

Selects the PCI devices with the specified physical link speed.

**[-functional-link-speed <text>] - Functional Link Speed(GT/s)**

Selects the PCI devices with the specified functional link speed.

**[-unique-name <text>] - Unique Name**

Selects the PCI devices with the specified unique name.

**[-corr-err-count <integer>] - Correctable Error Count**

Selects the PCI devices with the specified correctable error count.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the PCI devices with the specified health monitor status.

**[-display-name <text>] - Display Name**

Selects the PCI devices with the specified display name.

**[-cerr-diff <integer>] - Correctable Error Difference**

Selects the PCI devices with the specified difference in correctable error count.

## Examples

The example below displays the information about the PCIe devices present in all of the nodes in the cluster.

```
cluster1::> system controller pci show
```

Node	Display Name	Correctable Error Count	Functional Link Width	Functional Link Speed	Functional Status
cluster1-01	Ontap PCI Device 0	0	4	5GT/s	ok
cluster1-02	Ontap PCI Device 4	0	4	5GT/s	ok

The example below displays detailed information about a PCIe device in a node.

```
cluster1::> system controller pcie show -instance -node cluster1-01 -bus-number 1
Node: cluster1-01
    Bus Number: 1
    Device Number: 0
    Function Number: 0
    Slot Info: 0
    Health Monitor Name: controller
    Vendor ID: 11f8
    Device ID: 8001
    Physical Link Width: 4
    Functional Link Width: 4
    Physical Link Speed(GT/s): 5GT/s
    Functional Link Speed(GT/s): 5GT/s
    Unique Name: ontap0@pci0:1:0:0
    Correctable Error Count: 0
    Status: ok
    Display Name: Ontap PCI Device 0
    Correctable Error Difference: 0
```

## system controller pcicerr threshold modify

Modify the Node PCIe error alert threshold

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system controller pcicerr threshold modify** command modifies node-wide PCIe correctable error threshold counts in the cluster.

### Parameters

**[-pcie-cerr-threshold <integer>] - Corr. Error Limit**

The PCIe error threshold count that would trigger an alert if exceeded.

**[-nvram-bb-threshold <integer>] - NVRAM Bad Block limit**

The NVRAM bad block threshold count that would trigger an alert if exceeded.

## Examples

The example below displays the information about setting node-wide PCIe error threshold count in the cluster:

```
cluster1::> system controller threshold modify -pcie-cerr-threshold 100
```

## system controller pcicerr threshold show

Display the Node PCIe error alert threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller pcicerr threshold show** command displays information about node-wide PCIe correctable error threshold counts in the cluster.

## Examples

The example below displays the information about node-wide PCIe error threshold count in the cluster:

```
cluster1::> system controller pcicerr threshold show

PCIe Error Threshold
-----
                        200
```

## system controller platform-capability show

Display platform capabilities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller platform-capability show** command displays information about all platform capabilities for each controller in the cluster. By default, the command displays the following information about all controllers in the cluster:

- Controller Name
- Capability ID
- Capability Supported?
- Capability Name

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

Displays detailed information about all controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the specified controller.

**[-capability-id <integer>] - Capability ID**

Selects the desired capability ID.

**[-supported <text>] - Supported?**

Selects the desired capability support state (true or false).

**[-name <text>] - Capability Name**

Selects the desired capability name.

## Examples

The following example displays platform capability information for the controller:

```
cluster1::> system controller platform-capability show
Node          Capability ID Supported? Capability Name
-----
or-099-diag-01
              0          false    CAP_CMCI_ENABLED
              1          false    CAP_HA_CONFIG_ONLY
              2          true     CAP_SUPPORT_CARD_FRU
              3          true     CAP_SCORPIO_EN
              4          false    CAP_NVD_EN
              5          false    CAP_ENABLE_HPET
              6          false    CAP_VERIFY_ACPI_TABLE
7 entries were displayed.
```

# system controller replace cancel

Cancel ongoing controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system controller replace cancel** command is used to cancel a controller replacement that is in paused state (paused-on-request, paused-on-error or paused-for-intervention). The update cannot be canceled if it is not in a paused state.

## Examples

The following example displays a cancel operation:

```
cluster1::> system controller replace cancel
Warning: The controller replacement will be canceled and any changes will have to be
reverted manually.
Do you want to continue? {y|n}: y
Controller replacement canceled successfully.
```

# system controller replace pause

Pause ongoing controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system controller replace pause** command is used to pause a currently running replacement. The operation pauses at the next predefined update stage (for example, after finishing the current task it will pause the next restartable task) which might take some time to reach. When the update reaches the pause point, it transitions into the pause-on-request state.

## Examples

The following example displays pause operation:

```
cluster1::> system controller replace pause

A pause requested for Controller Replacement operation.
The current task will continue and the next restartable task will be paused.
```

# system controller replace resume

Resume paused controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system controller replace resume** command is used to resume an update that is currently in one of paused-on-request, paused-on-error or paused-for-intervention states. If the update is not paused then an error is returned.

## Examples

The following example shows a resume operation:

```
cluster1::> system controller replace resume  
  
Controller replacement resumed successfully.
```

# system controller replace show-details

Display detailed status of controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system controller replace show-details** command displays detailed information about the currently running and previously run non-disruptive controller replacement operations. The command displays the following information:

- Phase
- Node
- Task name
- Task status
- Error message

## Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the

specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[`-instance`] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-operation-identifier {None|Controller-replacement}`] - Operation Identifier**

Specifies the NDO operation identifier.

### **[`-task-identifier <integer>`] - Task Identifier**

Specifies the identification number of the task.

### **[`-node <nodename>`] - Node That Performs Operation**

Specifies the node that is to be replaced.

### **[`-task-phase {None|Initialization|Precheck|Commit|Collect-info|Preop|Resource-release|Verification|Resource-regain|Postop|Uncommit|Postcheck|Cleanup}`] - Task Phase**

Specifies the phase of the operation.

### **[`-task-name <text>`] - Name of the Task**

Specifies the name of the task.

### **[`-task-status {None|Ready-to-start|In-progress|Waiting|Paused-on-error||Paused-for-intervention|Paused-on-request|Completed-on-first-node|Completed|Failed|Pause_req|Canceled}`] - Status of the Task**

Specifies the status of the task.

### **[`-task-error <text>`] - Error During the Task Execution**

Specifies the error occurred.

### **[`-task-recovery-action <text>`] - Action to Recover from Error**

Specifies the action to be taken in case of error.

## Examples

The following example displays detailed information about the non-disruptive replacement operation:

```
cluster1::*> system controller replace show-details
Task Phase      Node           Task Name      Operation-State
-----
Precheck        node1          Cluster Health Check  Completed
                MCC Cluster Check  Completed
                Aggr Relocation    Completed
                Status Check
                Model Name Check   Completed
                Cluster Quorum Check Completed
                Image Version Check Completed
```

```

HA Status Check      Completed
Aggregate Status    Completed
Check
Disk Status Check    Completed
Data LIF Status Check Completed
Cluster LIF Status  Completed
Check
ASUP Status Check    Completed
CPU Utilization Check Completed
Aggr Reconstruction Completed
Check
Node Affinity Job    Completed
Check
Collect-info      node1      Verify Details      Paused-for-intervention
                  node2      Verify Details      Paused-for-intervention
17 entries were displayed.

```

## system controller replace show

Display status of controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system controller replace show** command displays overall information about the currently running, or previously run controller replacement operation. The command displays the following information:

- Operation Status
- Error message
- Recommended action

### Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

## Examples

The following example displays information about automated nondisruptive operation:

```
cluster1::*> system controller replace show
Node                Status                Error-Action
-----
node1               Paused-for-intervention  Follow the instructions given in
                               Step Details
node2               None

Step Details:
-----
Controller replacement operation has been paused for user intervention.
Collect the following info from the current node:
  1. vserver services name-service dns show
  2. service-processor show -node * -instance
  3. network port ifgrp show
  4. network port vlan show
  5. network interface failover-groups show
  6. storage array config show -switch switchname
  7. storage encryption disk show
2 entries were displayed.
```

## system controller replace start

Start controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system controller replace start** command is used to initiate a controller-replacement operation. The update is preceded by a validation of the HA pair to ensure that any issues that might affect the update are identified.

There are predefined points in the update when the update can be paused (either requested by the user or by the operation in case of an error or for manual intervention).

### Parameters

**[-nodes <nodename>, ...] - Nodes for Controller Replacement**

Specifies the nodes that are to be replaced.

**[-simulate <>true>] - Simulate Controller Replacement**

Dry run the operation. Checks for all validations.

**[-skip-metrocluster-check {true|false}] - Skip Metrocluster Check before Replacement**

Skips the DR mirror offline check when performing Metrocluster validation. In 4-node Metrocluster configuration, if controller replacement is already complete one one site, then the partner site should replace its controllers by setting this parameter to **true** . The default value is false.

**[-nso {true|false}] - Select NSO Procedure**

Follow the negotiated switchover switchback based controller replacement procedure for 4 node MCC FC system. To select ARL based procedure for 4 node MCC FC , this parameter needs to be set to **false** .This parameter is only honored in MCC configuration. Hence, setting or unsetting of this parameter has no effect in HA configuration. The default value is true for MCC FC.

## Examples

The following example shows the replacement operation:

```
cluster1::> system controller replace start -nodes node1,node2 -simulate true
```

```
Warning: 1.Current version of node is 9.4.0
```

```
    Before starting controller replacement, please ensure that the new
    controllers are in the version 9.4.0
```

```
2. Verify that NVMEM or NVRAM batteries of the new nodes are charged, and charge them
    if they are not. You need to physically check the new nodes to see if
    the NVMEM or NVRAM batteries are charged. You can check the battery status either
    by connecting to a console or using SSH, logging into the Service Processor
    (SP) for your system, and use the system sensors to see if the battery has a
    sufficient charge.
```

```
Attention: Do not try to clear the NVRAM contents. If there is a need to clear the
    contents of NVRAM, contact Fujitsu support personnel.
```

```
3. If you are replacing the controllers with an used one, please ensure to run
    wipeconfig before controller replacement
```

```
4. Current model name is FAS8040
```

```
    Before starting the operation, please ensure that the new controller model is
    supported for controller replacement.
```

```
Do you want to continue? {y|n}: y
```

```
Controller replacement: Prechecks in progress.....
```

```
Controller replacement has been paused for user intervention.
```

```
Please collect the following info from the current node:
```

```
vserver services name-service dns show
```

```
network interface show -curr-node node -role cluster,intercluster,node-mgmt,cluster-
mgmt
```

```
network port show -node node -type physical
```

```
service-processor show -node * -instance
```

```
network fcp adapter show -node node
```

```
network port ifgrp show
```

```
network port vlan show
```

```
system node show -instance -node node
```

```
run -node node sysconfig
```

```
storage aggregate show -node node
volume show -node node
network interface failover-groups show
storage array config show -switch switchname
system license show -owner node
storage encryption disk show
```

# system controller service-event delete

Manually clear a selected service event

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller service-event delete** command removes the service event from the list and extinguishes all related FRU attention LEDs.

In some cases, where the underlying fault condition remains, the service event might be reported again, causing it to reappear in the list. In such cases, it is necessary to remedy the underlying fault condition in order to clear the service event.

## Parameters

### **-node {<nodename>|local} - Node**

Selects service events on the specified nodes.

### **-event-id <integer> - Service Event ID**

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row to delete. Use the [system controller service-event show](#) command to find the event identifier for the service event to delete.

## Examples

The following example lists the currently active service events. Then, using the listed Service Event ID, the service event is deleted:

```
cluster1::> system controller service-event show

Node          ID  Event Location          Event Description
-----
plata4-1a    1   DIMM in slot 1 on Controller A   Uncorrectable ECC

cluster1::> system controller service-event delete -event-id 1
```

## Related Links

- [system controller service-event show](#)

# system controller service-event show

Display the active service events causing attention LEDs to be lit

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller service-event show** command displays one or more events that have been detected by the system for which a physical service action might be required. Physical service actions sometimes involve replacing or re-seating misbehaving FRUs. In such cases FRU attention LEDs will be illuminated to assist in physically locating the FRU in need of attention. When the FRU in question is contained within another FRU, both the inner and outer FRU attention LEDs will be lit. It creates a path of LEDs that starts at the chassis level and leads to the FRU in question. For example, if a DIMM is missing from the controller motherboard, the storage OS will detect this and log a service event whose location is the DIMM slot on the controller. The DIMM slot LED, controller LED and chassis LED will all be lit to create a path of LEDs to follow.

FRU Attention LEDs that are not visible from outside of the system (e.g. those on the controller motherboard such as DIMMs, boot device etc.) will remain on for a few minutes, even after power is removed from the containing FRU. As such, when the controller is removed from the chassis, a DIMM slot FRU attention LED will remain on, helping to locate the FRU in need of attention.

Generally, service events are cleared automatically when the issue is resolved. The corresponding FRU attention LEDs are extinguished accordingly. In cases where the service event request is caused by an environmental issue, it might be necessary to manually remove the service event from the list. This can be done using the [system controller service-event delete](#) command.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects service events on the specified nodes.

**[-event-id <integer>] - Service Event ID**

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row for use with the [system controller service-event delete](#) command

**[-event-loc <text>] - Location**

Selects the service events that match the specified event location.

**[-event-desc <text>] - Description**

Selects the service events that match the specified event description.

**[-event-timestamp <text>] - Timestamp**

The time that the event occurred, recorded by the Service Processor

## Examples

The following example lists the currently active service events.

```
cluster1::> system controller service-event show
```

Node	ID	Event Location	Event Description
plata4-1a	1	DIMM in slot 1 on Controller A	Uncorrectable ECC

# system controller slot module insert

Add a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller slot module insert` command adds a module on the controller.

## Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

**-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

## Examples

The following example adds a module in the local node:

```
p2i030::> system controller slot module insert -node local -slot 1

Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be powered
        on and initialized.
Do you want to continue? {y|n}:y
The module has been successfully powered on, initialized and placed into service.

p2i030::>
```

## system controller slot module remove

Remove a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller slot module remove` command removes a module on the controller.

### Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

**-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

## Examples

The following example removes a module in the local node:

```
p2i030::> system controller slot module remove -node local -slot 1

Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be
        powered off for removal.
Do you want to continue? {y|n}: y
The module has been successfully removed from service and powered off. It can now be
safely removed.

p2i030::>
```

# system controller slot module replace

Power off a module on the controller for replacement

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller slot module replace** command powers off a module on the controller for replacement.

## Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

**-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

## Examples

The following example powers off a module in the local node:

```
p2i030::> system controller slot module replace -node local -slot 1

Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be powered
off for replacement.
Do you want to continue? {y|n}: y
The module has been successfully powered off. It can now be safely replaced. After the
replacement module is inserted, use the "system controller slot module insert" command
to place the module into service.

p2i030::>
```

# system controller slot module show

Display hotplug status of a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller slot module show** command displays hotplug status of a module on the controller. The command displays the following information about the PCIe modules:

- Node
- Slot
- Module
- Status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**{ [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the PCIe modules that are present in the specified node.

**[-slot <text>] - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

**[-status <text>] - Module Status**

Selects hotplug status for PCIe modules.

**[-card <text>] - Module Name**

Selects module name for PCIe modules.

## Examples

The following example displays hotplug status of PCI modules found in the local node:

```

::> system controller slot module show -node local
Node          Slot  Module                               Status
-----
localhost     1     IO_CARRIER_NIANTIC_NIC             powered-on
localhost     2     IO_4X_10GBT_INTL_NIC                 powered-on
localhost     3     IO_4X_12Gb_PMC_SAS                    powered-on
localhost     4     IO_4X_10GBE_16GFC_QLGC_CNA           powered-on
localhost     5     IO_4X_12Gb_PMC_SAS                    powered-on
localhost     6     NVRAM10                               hotplug-not-supported
localhost     6-1   empty                                  empty
localhost     6-2   empty                                  empty
localhost     7     IO_4X_12Gb_PMC_SAS                    powered-on
localhost     8     IO_4X_10GBT_INTL_NIC                 powered-on

```

```
system controller sp config show
```

```
localhost          9      IO_4X_12Gb_PMC_SAS      powered-on
localhost          10     IO_4X_12Gb_PMC_SAS      powered-on
localhost          11     IO_4X_12Gb_PMC_SAS      powered-on
13 entries were displayed.

```

## system controller sp config show

Display the Service Processor Config Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system controller sp config show** command displays the following configuration information of the service processor for all nodes in the cluster:

- Node name
- Service processor status
- Service processor firmware version
- Booted firmware version
- Service processor configuration status
- Physical Ethernet link status of service processor
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the field that you specify.

**[-instance ] }**

Displays detailed configuration information of the service processor.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the service processor configuration of the specific node.

**[-version <text>] - Firmware Version**

Selects the service processor configuration with the specified firmware version.

**[-boot-version {primary|backup}] - Booted Version**

Selects the service processor configuration with the specified version of the currently booted partition.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the service processor configuration with the specified monitor name.

**[-sp-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - SP Status**

Selects the service processor configuration with the specified status of service processor.

**[-sp-config {true|false}] - Auto Update Configured**

Selects information about the service processor with the specified configuration status of the service processor.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the service processor configuration information with the specified service processor status.

**[-link-status {up|down|disabled|unknown}] - Public Link Status**

Selects the service processor configuration with the specified physical ethernet link status.

**[-name <text>] - Display Name**

Selects the service processor configuration with the specified unique name.

## Examples

The example below displays configuration of the service processor in all the nodes in the cluster:

```
cluster1::> system controller sp config show
      Firmware   Booted   Auto Update   SP   Link
Node  Version    Version   Configured   Status Status   Status
-----
node1  2.2.2       primary   true          online up       ok
node2  2.2.2       primary   true          online up       ok
```

The example below displays configuration of the service processor of a particular node in detail:

```
cluster1::> system controller sp config show -instance -node node1
      Node: node1
      Firmware Version: 2.2.2
      Booted Version: primary
      Health Monitor Name: controller
      SP Status: online
      Auto Update Configured: true
      Status: ok
```

Public Link Status: up  
Display Name: SP Config

# system controller sp upgrade show

Display the Service Processor Upgrade Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system controller sp upgrade show** command displays the following information about the service processor firmware of all the nodes in the cluster:

- Node name
- Is new firmware available?
- Is autoupdate enabled?
- Status of autoupdate
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

## Parameters

**{ [-fields <fieldname>, ... ] }**

Selects the fields that you specify.

**[ [-instance ] ] }**

Displays detailed upgrade information of the service processor.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the upgrade information of the service processor on the specified node.

**[-new-fw-avail {true|false}] - New Firmware Available**

Selects the information of the service processors which have new firmware available.

**[-new-fw-version <text>] - New Firmware Version**

Selects the information about service processors with the specified firmware version.

**[-auto-update {true|false}] - Auto Update**

Selects the information about service processors with the specified state.

**[-auto-update-stat {installed|corrupt|updating|auto-updating|none}] - Auto Update Status**

Selects the information about service processors with the specified auto update status.

**[-auto-update-sttime <MM/DD/YYYY HH:MM:SS>] - Auto Update Start Time**

Selects the information about service processors with the specified start time.

**[-auto-update-entime <MM/DD/YYYY HH:MM:SS>] - Auto Update End Time**

Selects the information about service processors with the specified end time.

**[-auto-update-per <integer>] - Auto Update Percent Done**

Selects the information about service processors with the specified auto update percentage completed.

**[-auto-update-maxret <integer>] - Auto Update Maximum Retries**

Selects the information about service processors with the specified maximum number of retries.

**[-auto-update-curret <integer>] - Auto Update Current Retries**

Selects the information about service processors with the specified number of current retries.

**[-auto-update-prevstat {failed|passed}] - Previous AutoUpdate Status**

Selects the information about service processors with the specified automatic update status.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the information about service processors with the specified monitor name.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the information about service processors with the specified health monitor status.

**[-name <text>] - Display Name**

Selects the information about service processors with the specified display name.

## Examples

The example below displays service processor upgrade information for all nodes in the cluster:

```
cluster1::> system controller sp upgrade show
New   Firmware      Auto Update   Auto Update
Node  Available       Feature       Status        Status
----  -
node1 false          true          installed     ok
node2 false          true          installed     ok
2 entries were displayed.
```

The example below displays the detailed service processor upgrade information for a specific node:

```
cluster1::> system controller sp upgrade show -instance -node node1
Node: node1
  New Firmware Available: false
  New Firmware Version: Not Applicable
  Auto Update: true
  Auto Update Status: installed
  Auto Update Start Time: Thu Oct 20 20:06:03 2012 Etc/UTC
  Auto Update End Time: Thu Oct 20 20:09:19 2012 Etc/UTC
  Auto Update Percent Done: 0
  Auto Update Maximum Retries: 5
  Auto Update Current Retries: 0
  Previous AutoUpdate Status: passed
  Health Monitor Name: controller
    Status: ok
    Display Name: SP Upgrade
```

## system feature-usage show-history

### Display Feature Usage History

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Display feature usage information in the cluster on a per-node and per-week basis.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays feature usage information for the specified node name.

**[-serial-number <Node Serial Number>] - Node Serial Number**

Displays feature usage information for the specified serial number.

**[-feature-name <Managed Feature>] - Feature Name**

Displays feature usage information for the specified feature name.

**[-week-number <Sequence Number>] - Week Number**

Displays feature usage information for the specified week number.

**[-usage-status {not-used|configured|in-use|not-available}] - Usage Status**

Displays feature usage information that matches the specified usage status.

**[-date-collected <MM/DD/YYYY HH:MM:SS>] - Collection Date**

Displays feature usage information that is collected on the day matching the specified date.

**[-owner <text>] - Owner**

Displays feature usage information for the specified owner name.

**[-feature-message <text>] - Feature Message**

Displays feature usage information that contains the specified feature message.

## Examples

The following example displays a usage output filtered by the serial number and feature name:

```
cluster1::> system feature-usage show-history -serial-number 1-81-
00000000000000001122334455 -feature-name NFS
Node Serial Number: 1-81-00000000000000001122334455
Feature Name: NFS
Owner: node1
Week # Usage Status      Date Collected      Feature Message
-----
    4 in-use             01/22/13 10:00:00
    3 in-use             01/15/13 10:00:00
    2 not-used           01/08/13 10:00:00
    1 configured         01/01/13 10:00:00

4 entries were displayed.
```

# system feature-usage show-summary

## Display Feature Usage Summary

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Display usage summary information about features in the cluster on a per-node basis. The summary information includes counter information such as the number of weeks the feature was in use and the last date and time the feature was used. Additional information can also be displayed by using the *-instance* parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-serial-number <Node Serial Number>] - Node Serial Number**

Displays usage summary information for the specified serial number.

**[-feature-name <Managed Feature>] - Feature Name**

Displays usage summary information for the specified feature name.

**[-weeks-in-use <integer>] - Weeks In-Use**

Displays usage summary information for features matching the number of weeks in use.

**[-last-used <MM/DD/YYYY HH:MM:SS>] - Date last used**

Displays usage summary information for features last used on the specified date.

**[-owner <text>] - Owner**

Displays usage summary information for the specified owner name.

**[-weeks-not-used <integer>] - Weeks Not Used**

Displays usage summary information for features matching the number of weeks not in use.

**[-weeks-configured <integer>] - Weeks Configured**

Displays usage summary information for features matching the number of weeks that the feature was in configuration.

**[-weeks-not-available <integer>] - Weeks Data Not Available**

Displays usage summary information for features matching the number of weeks when usage data was not available.

## Examples

The following example displays a usage summary output for a cluster of two nodes:

```
cluster1::> system feature-usage show-summary
Node Serial Number: 1-81-00000000000000001122334455
Owner: node1
Feature Name  Weeks In Use      Date Last Used
-----
CIFS          10 1/1/2013 23:27:49
NFS           15 1/8/2013 23:48:03
```

```

Node Serial Number: 1-81-000000000000001122334466
Owner: node2
Feature Name   Weeks In Use   Date Last Used
-----
CIFS           10 1/1/2013 23:26:38
NFS            20 1/8/2013 23:46:48
4 entries were displayed.

```

## system fru-check show

Display Information About the FRUs in the Controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system fru-check show** command checks and displays the results of quick diagnostic tests done for certain FRUs of each controller in the cluster. The tests are not intended to be exhaustive, but simply to do a quick check of certain FRUs especially after replacement.

### Parameters

**{ [-fields <fieldname>, ...]**

Selects the fields that have the specified name.

**[-instance ]}**

Selects detailed information (if available) for all the FRUs.

**[-node {<nodename>|local}] - Node**

Selects the FRUs that belong to the node that has the specified name.

**[-serial-number <text>] - FRU Serial Number**

Selects the FRU matching the specified serial number.

**[-fru-name <text>] - FRU Name**

Selects the FRU matching the specified fru-name.

**[-fru-type {controller|dimm|bootmedia|nvram|nvdim}] - FRU Type**

Selects the FRUs of the specified type.

**[-fru-status {pass|fail|unknown}] - Status**

Selects the FRUs whose FRU check status matches that specified. "pass" indicates the FRU is operational. "fail" indicates the FRU is not operating correctly. "unknown" indicates a failure to obtain FRU information during the check.

**[-display-name <text>] - Display Name**

Selects the FRU matching the specified display name.

**[-location <text>] - Location**

Selects the FRUs whose location matches that specified. Example: Memory Slot: 1

**[-additional-info <text>] - Additional Info**

Selects the FRUs whose additional information matches that specified. Example: Part No: 69003140-I00-NTA-T

**[-reason <text>] - Details**

Selects the FRUs whose failure reason matches that specified.

## system ha interconnect config show

Display the high-availability interconnect configuration information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system ha interconnect config show** command displays the high-availability interconnect device basic configuration information.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>,...** parameter, the command displays only the fields that you specify.

**[ [-instance ] ]**

Use this parameter to display all the fields from all nodes in cluster.

**[-node {<nodename>|local}] - Node**

Use this parameter to display all the fields from the specified node in the cluster.

**[-transport <text>] - Interconnect Type**

Selects the nodes that match this HA interconnect transport type.

**[-local-sysid <integer>] - Local System ID**

Selects the nodes that match this local system unique identifier.

**[-partner-sysid <integer>] - Partner System ID**

Selects the nodes that match this partner system unique identifier.

**[-initiator {local|partner}] - Connection Initiator**

Selects the nodes that match this parameter value. The value is the initiator of the connection request.

**[-port-name <text>,...] - Port**

Selects the nodes that match this port name.

**[-ipaddress <text>,...] - IP Address**

Selects the nodes that match this IP address.

**[-interface {backplane|external}] - Interface**

Selects the nodes that match this parameter value. **external** means the HA interconnect links between partner nodes are connected externally. **backplane** means the HA interconnect links between partner nodes are connected over the backplane.

## Examples

The following example displays the HA interconnect configuration information on FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect config show
Node: ic-f8040-01
    Interconnect Type: Infiniband (Mellanox ConnectX)
    Local System ID: 536875713
    Partner System ID: 536875678
    Connection Initiator: local
    Interface: backplane

Port   IP Address      Flags
----   -
ib0a   192.0.3.236    0x0
ib0b   192.0.3.237    0x0
Node: ic-f8040-02
    Interconnect Type: Infiniband (Mellanox ConnectX)
    Local System ID: 536875678
    Partner System ID: 536875713
    Connection Initiator: partner
    Interface: backplane

Port   IP Address      Flags
----   -
ib0a   192.0.3.96     0x0
ib0b   192.0.3.97     0x0

2 entries were displayed.
```

The following example displays the HA interconnect configuration information on FAS2500 series nodes in the cluster:

```
cluster1::*> system ha interconnect config show
Node: ic-f2554-03
    Interconnect Type: Infiniband (Mellanox Sinai)
    Local System ID: 1781036608
    Partner System ID: 1780360209
    Connection Initiator: local
    Interface: backplane
```

Port	IP Address	Flags
ib0a	ib0a	-

```
Node: ic-f2554-04
    Interconnect Type: Infiniband (Mellanox Sinai)
    Local System ID: 1780360209
    Partner System ID: 1781036608
    Connection Initiator: partner
    Interface: backplane
```

Port	IP Address	Flags
ib0a	ib0a	-

2 entries were displayed.

## system ha interconnect link off

Turn off the interconnect link

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system ha interconnect link off** command turns off the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn off the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn off the link.

### Parameters

#### **-node <nodename> - Node**

This mandatory parameter specifies the node on which the interconnect link is to be turned off. The value "local" specifies the current node.

#### **-link {0|1} - Link**

This mandatory parameter specifies the interconnect link number (0-based) to turn off.

## Examples

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0

Error: command failed: Invalid link value 0. Specify 1.

cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0

cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

## system ha interconnect link on

Turn on the interconnect link

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect link on** command turns on the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn on the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn on the link.

## Parameters

### **-node <nodename> - Node**

This mandatory parameter specifies the node on which the interconnect link is to be turned on. The value "local" specifies the current node.

### **-link {0|1} - Link**

This mandatory parameter specifies the interconnect link number (0-based) to turn on.

## Examples

The following example displays output of the command on the nodes with a single interconnect link

or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0  
Error: command failed: Invalid link value 0. Specify 1.  
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0  
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

## system ha interconnect ood clear-error-statistics

Clear error statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system ha interconnect ood clear-error-statistics** command enables you to clear all the error statistics collected for the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

### Parameters

**-node <nodename> - Node**

This mandatory parameter specifies which node will have the error statistics cleared. The value "local" specifies the current node.

### Examples

```
cluster1::*> system ha interconnect ood clear-error-statistics -node ic-f2554-03
```

# system ha interconnect ood clear-performance-statistics

Clear performance statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect ood clear-performance-statistics** command enables you to clear all the performance statistics collected for the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

**-node <nodename> - Node**

This mandatory parameter specifies which node will have the performance statistics cleared. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood clear-performance-statistics -node ic-f2554-03
```

# system ha interconnect ood disable-optimization

Disable coalescing work requests

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect ood disable-optimization** command disables the optimization capability on the high-availability interconnect device. The command is only supported on FAS2500 series nodes in the cluster.

## Parameters

**-node <nodename> - Node**

This mandatory parameter specifies which node will have the optimization disabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood disable-optimization -node ic-f2554-03
```

# system ha interconnect ood disable-statistics

Disable detailed statistics collection

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect ood disable-statistics** command disables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

**-node <nodename> - Node**

This mandatory parameter specifies which node will have the statistics collection disabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood disable-statistics -node ic-f2554-03
```

# system ha interconnect ood enable-optimization

Enable coalescing work requests

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect ood enable-optimization** command enables you to turn on optimization (coalescing out-of-order delivery requests) on the high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node**

This mandatory parameter specifies which node will have the optimization enabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood enable-optimization -node ic-f2554-03
```

# system ha interconnect ood enable-statistics

Enable detailed statistics collection

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect ood enable-statistics** command enables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node**

This mandatory parameter specifies which node will have the statistics collection enabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood enable-statistics -node ic-f2554-03
```

# system ha interconnect ood send-diagnostic-buffer

Send diagnostic buffer to partner

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect ood send-diagnostic-buffer** command enables you to run a short out-of-order delivery diagnostic test. The command sends a buffer to the partner controller over the high-availability interconnect. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

**-node <nodename> - Node**

This mandatory parameter specifies which node will send the diagnostic buffer to its partner. The value "local" specifies the current node.

## Examples

The following example demonstrates how to use this command to send a diagnostic buffer to the partner:

```
cluster1::*> system ha interconnect ood send-diagnostic-buffer -node ic-f2554-03
```

# system ha interconnect ood status show

Display the high-availability interconnect device out-of-order delivery (OOD) information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect ood status show** command displays configuration information of the out-of-order delivery-capable high-availability interconnect devices. This command is supported only on FAS2500 series nodes in the cluster.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command displays only the fields that you specify.

**[ [-instance ] ] }**

Use this parameter to display all the fields from all nodes in cluster.

**[-node {<nodename>|local}] - Node**

Use this parameter to display all the fields from the specified node in the cluster.

**[-is-ood-enabled {true|false}] - Is OOD Enabled**

Selects the nodes that match this parameter value.

**[-is-coalescing-enabled {true|false}] - Is Coalescing Enabled**

Selects the nodes that match this parameter value.

## Examples

The following example displays the HA interconnect device out-of-order delivery configuration information on FAS2500 series nodes in the cluster.

```
cluster1::*> system ha interconnect ood status show
Node: ic-f2554-03
    NIC Used: 0
    Is OOD Enabled: true
    Is Coalescing Enabled: true
Node: ic-f2554-04
    NIC Used: 0
    Is OOD Enabled: true
    Is Coalescing Enabled: true
2 entries were displayed.
```

## system ha interconnect port show

Display the high-availability interconnect device port information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system ha interconnect port show** command displays the high-availability interconnect device port physical layer and link layer status information.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command displays only the fields that you specify.

**[ [-instance ] ] }**

Use this parameter to display all the fields from all nodes in the cluster.

**[-node {<nodename>|local}] - Node**

Use this parameter to display all the fields from the specified node in the cluster.

**[-link-monitor {on|off}] - Link Monitor Detection**

Selects the nodes that match this parameter value.

**[-port <integer>,...] - Port Number**

Selects the nodes that match this parameter value.

**[-phy-layer-state {invalid|sleep|polling|disabled|port-configuration-testing|linkup|link-error-recovery|phytest|reserved}] - Physical Layer State**

Selects the nodes that match this parameter value.

**[-link-layer-state {invalid|down|initialize|armed|active|reserved}] - Link Layer State**

Selects the nodes that match this parameter value.

**[-phy-link-up-count <integer>,...] - Physical Link Up Count**

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned up.

**[-phy-link-down-count <integer>,...] - Physical Link Down Count**

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned down.

**[-is-active-link {true|false}] - Is the Link Active**

Selects the nodes that match this parameter value. The value **true** means the interconnect data channels are established on this link.

## Examples

The following example displays the HA interconnect device port information on FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect port show
      Physical Link
      Link      Layer Layer
Node  Monitor  Port  State  State  Physical Physical Active
-----  -----  ----  -----  -----  -----  -----  -----
ic-f8040-01  on
                0  linkup  active    1      0  true
                1  linkup  active    1      0  false
ic-f8040-02  on
                0  linkup  active    1      0  true
                1  linkup  active    1      0  false
2 entries were displayed.
```

# system ha interconnect statistics clear-port-symbol-error

Clear the high-availability interconnect port symbol errors

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect statistics clear-port-symbol-error` command clears the high-availability interconnect device port symbol errors. This command is supported only on FAS2500 series nodes in the cluster.

To display the high-availability interconnect device port statistics, use the [statistics show -object ic\\_hw\\_port\\_stats](#) command.

## Parameters

`-node <nodename>` - Node

Selects the nodes that match this parameter value.

## Examples

```
cluster1::*> system ha interconnect statistics clear-port-symbol-error -node ic-f2554-03
```

## Related Links

- [statistics show](#)

# system ha interconnect statistics clear-port

Clear the high-availability interconnect port counters

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect statistics clear-port` command clears the high-availability interconnect device port statistics. This command is supported only on FAS2500 series and FAS8000 series nodes in the cluster.

To display the high-availability interconnect device port statistics, use the [statistics](#)

`show -object ic_hw_port_stats` command.

## Parameters

**-node <nodename> - Node**

Selects the nodes that match this parameter value.

## Examples

```
cluster1::*> system ha interconnect statistics clear-port -node ic-f8040-01
```

## Related Links

- [statistics show](#)

# system ha interconnect statistics show-scatter-gather-list

Display the high-availability interconnect scatter-gather list entry statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect statistics show-scatter-gather-list` command displays the high-availability interconnect device scatter-gather list entry statistics. Out of all possible 32 entries in a scatter-gather list, the command displays only the entries that have valid data.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**[-instance ]}**

Use this parameter to display all the fields from all nodes in cluster.

**[-node {<nodename>|local}] - Node**

Use this parameter to display all the fields from the specified node in the cluster.

**[-sge <integer>,...]** - Scatter-Gather Entry

Selects the nodes that match this scatter-gather element index value.

**[-total-count <integer>,...] - Total Count**

Selects the nodes that match this parameter value. The value is the total number of times a particular scatter-gather list element is used.

**[-total-size <integer>,...] - Total Size**

Selects the nodes that match this parameter value. The value is the total number of bytes written by the high-availability interconnect device using a particular scatter-gather list element.

## Examples

```
cluster1::*> system ha interconnect statistics show-scatter-gather-list
```

```
Node: ic-f8040-01
```

Entry	Count	Size
1	410925	77344493
2	988	1246987
3	72	747325
4	93264	1527155579
8	9	294912
9	9	294912

```
Node: ic-f8040-02
```

Entry	Count	Size
1	1544405	310004390
2	6217	16779908
3	1222	12003411
4	338606	5543436659
6	2	41980
7	2	46136
8	18	589824
9	18	589824

```
2 entries were displayed.
```

# system ha interconnect statistics performance show

Display the high-availability interconnect device performance statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system ha interconnect statistics performance show** command displays the high-availability

interconnect device performance statistics.

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>,...** parameter, the command displays only the fields that you specify.

### **| [-instance ] }**

Use this parameter to display all the fields from all nodes in cluster.

### **[-node {<nodename>|local}] - Node**

Use this parameter to display all the fields from the specified node in the cluster.

### **[-elapsed <integer>] - Elapsed Time (secs)**

Selects the nodes that match this parameter value. Displays the total elapsed time between statistics collection start time to end time. During the initialization stage, statistics collection starts when the partner node is up and ready. After the initialization stage, the statistics collection start time is reset after every execution of this command. This means that after the initialization stage, elapsed time represents the time between current command execution and previous command execution.

### **[-qmax-wait <integer>] - Maximum Queue Wait Count**

Selects the nodes that match this wait value. The queue maximum wait value is the total number of times the interconnect device waited to post requests on the send queue.

### **[-qmax-wait-time <integer>] - Average Queue Wait Time (usecs)**

Selects the nodes that match this average wait time value. The queue maximum wait time is the average amount of time the interconnect device waited to post requests on the send queue.

### **[-qmax-timeout <integer>] - Maximum Queue Timeouts**

Selects the nodes that match this parameter value. The queue maximum timeout value is the total number of times the interconnect device timed out waiting to post requests on the send queue.

### **[-preempt-timeout <integer>] - Preempt Timeouts**

Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID is preempted.

### **[-nonpreempt-timeout <integer>] - Non-Preempt Timeouts**

Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID stopped due to interconnect device read/write timeout.

### **[-notify-timeout <integer>] - Notify Timeouts**

Selects the nodes that match this parameter value. The timeout value is the total number of times data transfer on the HA interconnect timed out.

**[-avg-rnv-msgs-time <integer>] - Remote NV Messages Average Time (usecs)**

Selects the nodes that match this parameter value. The value is the average time between remote NV messages.

**[-rnv-transfers <integer>] - Total Remote NV Transfers**

Selects the nodes that match this parameter value. The value is the total number of remote NV transfers attempted.

**[-avg-rnv-transfer-size <integer>] - Remote NV Average Transfer Size**

Selects the nodes that match this parameter value. The value is the average remote NV message transfer size.

**[-avg-rnv-transfer-time <integer>] - Remote NV Transfers Average Time (usecs)**

Selects the nodes that match this parameter value. The value is the average transfer time taken by remote NV messages.

**[-ic-waits <integer>] - Total Count of IC waits for Given ID**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waits until the transfer of a given ID is successful.

**[-ic-waitdone-time <integer>] - Average IC Waitdone Time (usecs)**

Selects the nodes that match this parameter value. The value is the average time the interconnect device spent waiting for the IDs to be transferred successfully.

**[-ic-isdone <integer>] - Total IC isdone Checks**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect client checked for the completion of a given transfer ID.

**[-ic-isdone-pass <integer>] - Total IC isdone Checks Success**

Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is successful.

**[-ic-isdone-fail <integer>] - Total IC isdone Checks Failed**

Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is not successful.

**[-ic-small-writes <integer>] - IC Small Writes**

Selects the nodes that match this parameter value. The value is the total number of <4K size writes performed by the interconnect device.

**[-ic-4k-writes <integer>] - IC 4K Writes**

Selects the nodes that match this parameter value. The value is the total number of 4K size writes performed by the interconnect device.

**[-ic-8k-writes <integer>] - IC 8K Writes**

Selects the nodes that match this parameter value. The value is the total number of 8K size writes performed by the interconnect device.

**[-ic-16k-writes <integer>] - IC 16K+ Writes**

Selects the nodes that match this parameter value. The value is the total number of 16K or more size writes performed by the interconnect device.

**[-ic-xorder-writes <integer>] - IC XORDER Writes**

Selects the nodes that match this parameter value. The value is the total number of out-of-order writes performed by the interconnect device.

**[-ic-xorder-reads <integer>] - IC XORDER Reads**

Selects the nodes that match this parameter value. The value is the total number of out-of-order reads performed by the interconnect device.

**[-rdma-read <integer>] - RDMA Reads Count**

Selects the nodes that match this parameter value. The value is the total number of RDMA reads performed by the interconnect device.

**[-rdma-read-waitdone-time <integer>] - Average IC Waitdone RDMA-READ Time (usecs)**

Selects the nodes that match this parameter value. The value is the average time the interconnect device spent polling for transfer IDs on the RDMA-read channel.

**[-avg-mbytes-second <text>] - Average MegaBytes Transferred per second**

Selects the nodes that match this parameter value. The value is the average megabytes (MB) transferred per second.

**[-avg-bytes-transfer <integer>] - Average Bytes per Transfer**

Selects the nodes that match this parameter value. The value is the average amount of bytes sent per transfer.

**[-total-transfers <integer>] - Total Transfers**

Selects the nodes that match this parameter value. The value is the total number of transfers made through the interconnect device.

**[-avg-nvlog-sync-time <integer>] - Average Time for NVLOG Sync (msecs)**

Selects the nodes that match this parameter value. The value is the average time taken to sync NVLOG between HA partner nodes.

**[-max-nvlog-sync-time <integer>] - Maximum Time for NVLOG Sync (msecs)**

Selects the nodes that match this parameter value. The value is the maximum time taken to sync NVLOG between HA partner nodes.

**[-max-sgl-length <integer>] - Maximum Scatter-Gather Elements in a List**

Selects the nodes that match this parameter value. The value is the maximum length of the scatter-gather list supported by the interconnect device.

**[-ic-recq-waits <integer>] - Total Receive Queue Waits to Post Buffer**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waited to post an empty buffer into the receive queue.

**[-avg-recq-wait-time <integer>] - Average Time Receive Queue Waited (usecs)**

Selects the nodes that match this parameter value. The value is the average amount of time the interconnect device waited to post an empty buffer into the receive queue.

## Examples

The following example displays the HA interconnect device performance statistics for FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect statistics performance show
                                     Node: ic-f8040-01
                                     Elapsed Time (secs): 6
                                     Maximum Queue Wait Count: 33
                                     Average Queue Wait Time (usecs): 30

## system ha interconnect status show

Display the high-availability interconnect connection status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect status show` command displays the high-availability interconnect

connection status. Connection status information displayed by this command varies by controller model. For nodes with two HA interconnect links over the backplane or connected externally, this command displays the following information:

- Node
- Link status on the first port
- Link status on the second port
- Is the link on first port active?
- Is the link on second port active?
- Interconnect RDMA status

For nodes with a single HA interconnect link, this command displays following the information:

- Node
- Link status
- Interconnect RDMA status

Running the command with the **-instance** or **-node** parameter displays detailed information about the interconnect device and its ports.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>,...** parameter, the command displays only the fields that you specify.

**[-instance ]}**

Use this parameter to display all the fields for the specified node or all the nodes.

**[-node {<nodename>|local}] - Node**

Use this parameter to display all the fields for the specified node.

**[-link-status {up|down}] - Link Status**

Selects the nodes that match this parameter value. The value **up** means link is online.

**[-link0-status {up|down}] - Link 0 Status**

Selects the nodes that match this parameter value. The value **up** means link is online.

**[-link1-status {up|down}] - Link 1 Status**

Selects the nodes that match this parameter value. The value **up** means link is online.

**[-ic-rdma {up|down}] - IC RDMA Connection**

Selects the nodes that match this parameter value. The value **up** means active interconnect connection with its partner.

**[-is-link0-active {true|false}] - Is Link 0 Active**

Selects the nodes that match this parameter value. The value **true** means the interconnect data channels are established on this link.

**[-is-link1-active {true|false}] - Is Link 1 Active**

Selects the nodes that match this parameter value. The value **true** means the interconnect data channels are established on this link.

**[-slot <integer>] - Slot Number**

Selects the nodes that match this PCI slot number.

**[-driver-name <text>] - Driver Name**

Selects the nodes that match this interconnect device driver name.

**[-firmware <text>] - Firmware Revision**

Selects the nodes that match this firmware version.

**[-version <text>] - Version Number**

Selects the nodes that match this parameter value.

**[-device-type <text>] - Device Type**

Selects the nodes that match this interconnect device type.

**[-serial-number <text>] - Serial Number**

Selects the nodes that match this interconnect device serial number.

**[-debug-firmware {yes|no}] - Debug Firmware**

Selects the nodes that match this parameter value.

**[-command-revision <integer>] - Command Revision**

Selects the nodes that match this interconnect device command revision.

**[-hardware-revision <integer>] - Hardware Revision**

Selects the nodes that match this interconnect device hardware revision.

**[-port1 <integer>] - Port Number 1**

Selects the nodes that match this parameter value.

**[-port1-port-name <text>] - Port Name**

Selects the nodes that match this port name.

**[-port1-gid <text>] - Global Identifier**

Selects the nodes that match this global identifier value.

**[-port1-base-lid <text>] - Base Local Identifier**

Selects the nodes that match this base local identifier value.

**[-port1-rm-lid <text>] - Remote Local Identifier**

Selects the nodes that match this remote local identifier value.

**[-port1-mtu <integer>] - Maximum Transmission Unit**

Selects the nodes that match this parameter value.

**[-port1-data-rate <text>] - Data Rate**

Selects the nodes that match this parameter value.

**[-port1-link-info <text>] - Link Information**

Selects the nodes that match this parameter value.

**[-port1-qsfp-vendor <text>] - QSFP Vendor**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

**[-port1-qsfp-part-number <text>] - QSFP Part Number**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part-number.

**[-port1-qsfp-type <text>] - QSFP Type**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

**[-port1-qsfp-serial-number <text>] - QSFP Serial Number**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

**[-port2 <integer>] - Port Number 2**

Selects the nodes that match this parameter value.

**[-port2-port-name <text>] - Port Name**

Selects the nodes that match this port name.

**[-port2-gid <text>] - Global Identifier**

Selects the nodes that match this global identifier value.

**[-port2-base-lid <text>] - Base Local Identifier**

Selects the nodes that match this base local identifier value.

**[-port2-rm-lid <text>] - Remote Local Identifier**

Selects the nodes that match this remote local identifier value.

**[-port2-mtu <integer>] - Maximum Transmission Unit**

Selects the nodes that match this parameter value.

**[-port2-data-rate <text>] - Data Rate**

Selects the nodes that match this parameter value.

**[-port2-link-info <text>] - Link Information**

Selects the nodes that match this parameter value.

**[-port2-qsfp-vendor <text>] - QSFP Vendor**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

**[-port2-qsfp-part-number <text>] - QSFP Part Number**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part number.

**[-port2-qsfp-type <text>] - QSFP Type**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

**[-port2-qsfp-serial-number <text>] - QSFP Serial Number**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

## Examples

The following example displays status information about the HA interconnect connection on FAS8000 series nodes with two HA interconnect links in the cluster:

```
cluster1::*> system ha interconnect status show
Node: ic-f8040-01
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
Node: ic-f8040-02
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
2 entries were displayed.
```

The following example displays status information about the HA interconnect connection on FAS2500 series nodes with a single HA interconnect link in the cluster:

```
cluster1::*> system ha interconnect status show
Node: ic-f2554-01
    Link Status: up
    IC RDMA Connection: up
Node: ic-f2554-02
    Link Status: up
    IC RDMA Connection: up
2 entries were displayed.
```

The following example displays detailed information about the HA interconnect link when parameters like **-instance** , **-node** are used with the ``system ha interconnect status show `` command

```
cluster1::*> system ha interconnect status show -instance -node ic-f8040-01
Node: ic-f8040-01
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
        Slot: 0
        Driver Name: IB Host Adapter i0 (Mellanox ConnectX MT27518 rev. 0)
        Firmware: 2.11.534
        Debug Firmware: no

Interconnect Port 0 :
    Port Name: ib0a
        GUID: fe80:0000:0000:0000:00a0:9800:0030:33ec
        Base LID: 0x3ec
        MTU: 4096
        Data Rate: 40 Gb/s (4X) QDR
    Link Information: ACTIVE

Interconnect Port 1 :
    Port Name: ib0b
        GUID: fe80:0000:0000:0000:00a0:9800:0030:33ed
        Base LID: 0x3ed
        MTU: 4096
        Data Rate: 40 Gb/s (4X) QDR
    Link Information: ACTIVE
```

## system health alert delete

Delete system health alert

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system health alert delete** command deletes all the alerts on the cluster with the specified input parameters.

### Parameters

**-node {<nodename>|local}** - Node

Use this parameter to delete alerts generated on a cluster only on the node you specify.

**-monitor <hm\_type>** - Monitor

Use this parameter to delete alerts generated on a cluster only on the monitor you specify.

**-alert-id <text> - Alert ID**

Use this parameter to delete alerts generated on a cluster only on the alert ID you specify.

**-alerting-resource <text> - Alerting Resource**

Use this parameter to delete alerts generated on a cluster on the alerting resource you specify.

## Examples

This example shows how to delete an alert with the specified alert-id:

```
cluster1::> system health alert delete -alert-id DualPathToDiskShelf_Alert -alerting
-resource *
```

# system health alert modify

Modify system health alert

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system health alert modify** command suppresses alerts generated on the cluster and sets the acknowledgement state for an alert.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which you want to change the state.

**-monitor <hm\_type> - Monitor**

Use this parameter to specify the monitor name on which you want to change the state.

**-alert-id <text> - Alert ID**

Use this parameter to specify the alert ID on which you want to change the state.

**-alerting-resource <text> - Alerting Resource**

Use this parameter to specify the alerting resource name on which you want to change the state.

**[-acknowledge {true|false}] - Acknowledge**

Use this parameter to set the acknowledgement state to true or false.

**[-suppress {true|false}] - Suppress**

Use this parameter to set the suppress state to true or false.

**[-acknowledger <text>] - Acknowledger**

Use this parameter to set the acknowledgedger as the filter for setting state.

**[-suppressor <text>] - Suppressor**

Use this parameter to set the suppressor as the filter for setting state.

## Examples

This example modifies the alert field states on the cluster:

```
cluster1::> system health alert modify -node * -alert-id DualPathToDiskShelf_Alert  
-suppress true
```

# system health alert show

View system health alerts

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system health alert show** command displays information about all the alerts generated on the system. Using **-instance** will add detailed information.

## Parameters

{ [-fields <fieldname>,...]

Selects the fields that you specify.

[-instance ]}

Displays the following additional information about each alert:

- Node name
- Resource name
- Severity of the alert
- Time of alert generation
- Suppress state of the alert
- Acknowledge state of the alert
- Probable cause for the alert
- Possible effect due to the alert
- Recommended corrective actions to follow

**[-node {<nodename>|local}] - Node**

Selects the alerts generated for the specified node.

**[-monitor <hm\_type>] - Monitor**

Selects the alerts with the specified monitor name.

**[-alert-id <text>] - Alert ID**

Selects the alerts with the specified alert ID.

**[-alerting-resource <text>] - Alerting Resource**

Selects the alerts with the specified alerting resource name.

**[-subsystem <hm\_subsystem>] - Subsystem**

Selects the alerts generated on the monitoring subsystem.

**[-indication-time <Date>] - Indication Time**

Selects the alerts with the specified indicated time.

**[-perceived-severity <hm\_perceived\_sev>] - Perceived Severity**

Selects the alerts with the perceived severity level.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Selects the alerts that contain the specified probable cause.

**[-probable-cause-description <text>] - Description**

Selects the alerts containing the specified probable cause description.

**[-corrective-actions <text>] - Corrective Actions**

Selects the alerts with the specified recommended corrective action.

**[-possible-effect <text>] - Possible Effect**

Selects the alerts with the specified possible effect.

**[-acknowledge {true|false}] - Acknowledge**

Selects the alerts with the specified acknowledgement status.

**[-suppress {true|false}] - Suppress**

Selects the alerts with the specified suppressor field status of true or false.

**[-policy <text>] - Policy**

Selects the alerts with the specified policy name.

**[-acknowledger <text>] - Acknowledger**

Selects the alerts with the specified acknowledger field.

**[-suppressor <text>] - Suppressor**

Selects the alerts with the specified suppressor field.

**[-additional-info <text>,...] - Additional Information**

Selects the alerts with the specified additional information.

**[-alerting-resource-name <text>] - Alerting Resource Name**

Selects the alerts with the specified alerting resource name.

**[-tags <hm\_alert\_type>,...] - Additional Alert Tags**

Selects the alerts with the specified keywords.

## Examples

The example below displays information about all the alerts generated in the cluster:

```
cluster1::> system health alert show
Node: node1
    Alert ID: DualPathToDiskShelf_Alert
    Resource: Shelf ID 2
    Severity: Major
    Suppress: false
    Acknowledge: false
    Tags: quality-of-service, nondisruptive-upgrade
    Probable Cause: Disk shelf 2 does not have two paths to controller
node1.
    Possible Effect: Access to disk shelf 2 via controller node1 will be
lost with a single hardware component failure (e.g.
cable, HBA, or IOM failure).
    Corrective Actions: 1. Halt controller node1 and all controllers attached to disk
shelf 2.
2. Connect disk shelf 2 to controller node1 via two paths
following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
```

The example below displays additional information about a specific alert generated in the cluster:

```
cluster1::> system health alert show -monitor node-connect -alert-id
DualPathToDiskShelf_Alert -instance
Node: node1
    Monitor: node-connect
    Alert ID: DualPathToDiskShelf_Alert
    Alerting Resource: 50:05:0c:c1:02:00:0f:02
    Subsystem: SAS-connect
    Indication Time: Mon Mar 21 10:26:38 2011
    Perceived Severity: Major
    Probable Cause: Connection_establishment_error
    Description: Disk shelf 2 does not have two paths to controller node1.
    Corrective Actions: 1. Halt controller node1 and all controllers attached to disk
shelf 2.
```

```

                2. Connect disk shelf 2 to controller node1 via two paths
following the rules in the Universal SAS and ACP Cabling Guide.
                3. Reboot the halted controllers.
                4. Contact support personnel if the alert persists.
Possible Effect: Access to disk shelf 2 via controller node1 will be lost with
a single hardware component failure (e.g. cable, HBA, or IOM failure).
Acknowledge: false
Suppress: false
Policy: DualPathToDiskShelf_Policy
Acknowledger: -
Suppressor: -
Additional Information: Shelf uuid: 50:05:0c:c1:02:00:0f:02
Shelf id: 2
Shelf Name: 4d.shelf2
Number of Paths: 1
Number of Disks: 6
Adapter connected to IOMA:
Adapter connected to IOMB: 4d
Alerting Resource Name: Shelf ID 2
Additional Alert Tags: quality-of-service, nondisruptive-upgrade

```

## system health alert definition show

Display system health alert definition

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system health alert definition show** command displays information about the various alerts defined in the system health monitor policy file. Using **-instance** will display additional details.

### Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

[-instance ]}

Use this parameter to display additional information on each alert definition.

- Node name
- Monitor name
- Subsystem identifier
- Alert ID
- Severity of the alert

- Probable cause
- Probable cause description
- Possible effect due the error state
- Recommended corrective actions to be followed
- Any additional information
- Additional alert tags

**[-node {<nodename>|local}] - Node**

Selects the alert definitions for the specified node.

**[-monitor <hm\_type>] - Monitor**

Selects the alert definitions with the specified monitor name.

**[-alert-id <text>] - Class of Alert**

Selects the alert definitions with the specified alert identifier.

**[-perceived-severity <hm\_perceived\_sev>] - Severity of Alert**

Selects the alert definitions with the specified perceived severity.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Selects the alert definitions with the specified probable cause of the alert.

**[-probable-cause-description <text>] - Probable Cause Description**

Selects the alert definitions with the specified probable cause description.

**[-possible-effect <text>] - Possible Effect**

Selects the alert definitions with the specified possible effect.

**[-corrective-actions <text>] - Corrective Actions**

Selects the alert definitions with the specified corrective action.

**[-subsystem <hm\_subsystem>] - Subsystem Name**

Selects the alert definitions with the specified subsystem.

**[-additional-information <text>] - Additional Relevant Data**

Selects the alert definitions with the specified additional information.

**[-tags <hm\_alert\_type>, ...] - Additional Alert Tags**

Selects the alert definitions with the specified keywords.

## Examples

The example below displays information about all the definitions in the alert definition file:

```
cluster1::> system health alert definition show
Node           Monitor           Subsystem           Alert ID
```

```

-----
node-01      system-connect      SAS-connect      DualControllerNonHa_
                          Alert
              Severity: Major
              Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected to
                          two controllers
                          ($(sschm_shelf_info.connected-nodes)) that are
                          not an HA pair.
              Possible Effect: Access to disk shelf $(sschm_shelf_info.id) may
                          be lost with a single controller failure.
              Corrective Actions: 1. Halt all controllers that are connected to disk shelf
$(sschm_shelf_info.id).
                          2. Connect disk shelf $(sschm_shelf_info.id) to both HA
controllers following the rules in the Universal SAS and ACP Cabling Guide.
                          3. Reboot the halted controllers.
                          4. Contact support personnel if the alert persists.
              Additional Info: -
              Tags: quality_of_service, nondisruptive-upgrade

```

The example below displays detailed information about the definitions in the alert definition file:

```

cluster1::> system health alert definition show -instance
Node: krivC-01
              Monitor: system-connect
              Class of Alert: DualControllerNonHa_Alert
              Severity of Alert: Major
              Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected to two
controllers ($(sschm_shelf_info.connected-nodes)) that are not an HA pair.
              Possible Effect: Access to disk shelf $(sschm_shelf_info.id) may be lost
with a single controller failure.
              Corrective Actions: 1. Halt all controllers that are connected to disk shelf
$(sschm_shelf_info.id).
              2. Connect disk shelf $(sschm_shelf_info.id) to both HA controllers following
the rules in the Universal SAS and ACP Cabling Guide.
              3. Reboot the halted controllers.
              4. Contact support personnel if the alert persists.
              Subsystem Name: SAS-connect
              Additional Relevant Data: -
              Additional Alert Tags: quality_of_service, nondisruptive-upgrade

```

## system health autosupport trigger history show

View system health alert history

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system health autosupport trigger history show** command displays all the alert triggers in the cluster that generated the AutoSupport messages. The following fields are displayed in the output:

- Node name
- Monitor name
- Subsystem
- Alert identifier
- Alerting resource
- Severity
- If an AutoSupport has been sent due to this alert

## Parameters

**{ [-fields <fieldname>,...]**

Use this parameter to display only the fields you specify.

**[-instance ]}**

Use this parameter to display additional information about all of the alerts that were generated.

**[-node {<nodename>|local}] - Node**

Use this parameter to display AutoSupport trigger history on the specified node.

**[-monitor <hm\_type>] - Monitor**

Use this parameter to display AutoSupport trigger history with the specified monitor name.

**[-alert-id <text>] - Alert ID**

Use this parameter to display the AutoSupport message that was triggered by the specified alert ID.

**[-alerting-resource <text>] - Alerting Resource**

Use this parameter to display the AutoSupport message that was triggered by the specified alerting resource.

**[-subsystem <hm\_subsystem>] - Subsystem**

Use this parameter to display the AutoSupport message that was triggered by the specified subsystem.

**[-indication-time <Date>] - Indication Time**

Use this parameter to display the AutoSupport message that was triggered at the indicated time.

**[-perceived-severity <hm\_perceived\_sev>] - Perceived Severity**

Use this parameter to display the AutoSupport message that was triggered by alerts with the specified perceived severity.

**[-autosupport-triggered {true|false}] - AutoSupport Triggered**

Use this parameter to display the alerts that generated AutoSupport messages.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Use this parameter to display the alerts that were generated with the specified probable cause.

**[-corrective-actions <text>] - Corrective Actions**

Use this parameter to display the AutoSupport alerts with the specified corrective actions.

**[-asup-enable {true|false}] - Enable Asup for This Alert**

Use this parameter to enable or disable an AutoSupport message for this alert.

**[-alert-clear-time <Date>] - Alert Clear Time**

Use this parameter to display the alerts that were cleared at a given time.

## Examples

This example displays information about the AutoSupport trigger history

```
cluster1::> system health autosupport trigger history show
Node           Monitor           Subsystem           Alert ID
-----
node1          node-connect      SAS-connect         DualPathToDiskShelf_
                                     Alert
Resource: 50:05:0c:c1:02:00:0f:02
Severity: Major
AutoSupport sent: true
```

This example displays info about the autosupport trigger history in detail

```
cluster1::> system health autosupport trigger history show -instance
Node: node1
Monitor: node-connect
Alert ID: DualPathToDiskShelf_Alert
Alerting Resource: 50:05:0c:c1:02:00:0f:02
Subsystem: SAS-connect
Indication Time: Thu Mar 17 11:59:09 2011
Perceived Severity: Major
AutoSupport Triggered: true
Probable Cause: Connection_establishment_error
Corrective Actions: 1. Halt controller node1 and all controllers attached to
disk shelf 2.
2. Connect disk shelf 2 to controller node1 via two paths following the rules in the
```

```

Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Enable asap for this alert: true
Alert Clear Time: Wed May 29 16:10:13 2013

```

## system health config show

Display system health configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system health config show** command displays the configuration and status of each health monitor in the cluster. The command shows a health status for each health monitor. The health status is an aggregation of the subsystem health for each subsystem that the health monitor monitors. For example, if a health monitor monitors two subsystems and the health status of one subsystem is "ok" and the other is "degraded", the health status for the health monitor is "degraded".

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the health monitors present on the specified node.

**[-monitor <hm\_type>] - Monitor**

Use this parameter to display the health monitors with the specified monitor name.

**[-subsystem <hm\_subsystem>, ...] - Subsystem**

Selects the health monitors with the specified subsystems.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health**

Selects the health monitors with the specified health status.

**[-mon-version <text>] - Monitor Version**

Selects the health monitors with the specified monitor version.

**[-pol-version <text>] - Policy File Version**

Selects the health monitors with the specified health monitor policy version.

**[-context {Node |Cluster}] - Context**

Selects the health monitors with the specified running context.

**[-aggregator <hm\_type>] - Aggregator**

Selects the health monitors with the specified aggregator.

**[-resources <text>,...] - Resource**

Selects the health monitors with the specified resource name.

**[-init-state {Invalid|Initailizing|Initialized|Starting\_Discovery|Starting\_Re-Discovery|Discovery\_Done\_Partially|Discovery\_Done}] - Subsystem Initialization Status**

Selects the health monitors with the specified subsystem initialization state.

**[-sub-pol-versions <text>] - Subordinate Policy Versions**

Selects the health monitors with the specified subordinate policy version.

## Examples

The example below displays information about health monitor configuration:

```
cluster1::> system health config show
Node          Monitor          Subsystem        Health
-----
node1         node-connect     SAS-connect     degraded
node1         system-connect   SAS-connect     degraded
node1         system           SAS-connect     degraded
```

The example below displays detailed information about health monitor configuration:

```
cluster1::> system health config show -instance
Node: node1
           Monitor: node-connect
           Subsystem: SAS-connect
           Health: degraded
           Monitor Version: 1.0
           Policy File Version: 1.0
           Context: node_context
           Aggregator: system-connect
           Resource: SasAdapter, SasDisk, SasShelf
           Subsystem Initialization Status: initialized
           Subordinate Policy Versions: 1.0 SAS, 1.0 SAS multiple adapters
```

# system health policy definition modify

Modify system health policy definition

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system health policy definition modify** enables or disables health monitoring policies based on input parameters the user provides.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which you want to enable or disable the policy.

**-monitor <hm\_type> - Monitor**

Use this parameter to specify the monitor name for which you want to be enable or disable the policy.

**-policy-id <text> - Policy**

Use this parameter to specify the policy identifier that you want to enable or disable.

**[-enable {true|false}] - Policy Status**

Use this parameter with the value "true" to enable the policy. Set the value to "false" to disable the policy.

**[-asup-enable {true|false}] - Enable AutoSupport for This Alert**

Use this parameter to enable or disable an AutoSupport message for this alert.

## Examples

This example modifies policy state on the cluster:

```
cluster1::> system health policy definition modify -node node1
             -policy-id ControllerToShelfIomA_Policy -enable false -monitor *
```

# system health policy definition show

Display system health policy definitions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system health policy definition show** command lists the health monitor policy definitions as described by the health monitor policy file. The command displays the following fields:

- Node name
- Monitor name
- Policy name
- Policy rule expression
- Expression for joining two tables
- Policy status
- Alert identifier
- Responsible resource name

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node**

Selects policy definitions for the specified node.

**[ -monitor <hm\_type> ] - Monitor**

Selects policy definitions with the specified monitor name.

**[ -policy-id <text> ] - Policy**

Selects policy definitions with the specified policy identifier.

**[ -rule-expression <ArithExpr> ] - Rule Expression**

Selects policy definitions with the specified rule of expression.

**[ -where <ArithExpr> ] - Variable Equivalence**

Selects rules that match the provided expression. This expression is part of the alert definition. It is shown for reference only and cannot be changed.

**[ -enable {true|false} ] - Policy Status**

Use this parameter with the value set to "true" to select policy definitions that are enabled. Set the value to "false" to select policy definitions that are disabled.

**[-alert-id <text>] - Alert ID**

Selects all policy definitions of the specified alert identifier.

**[-responsible-resource-info <text>] - Table and ID of Resource at Fault**

Selects all policy definitions with the specified responsible resource.

**[-asup-enable {true|false}] - Enable AutoSupport for This Alert**

Selects policy definitions for which AutoSupport messages are either enabled or disabled.

## Examples

The example below displays information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show
Node          Monitor          Policy
-----
node1         node-connect     ControllerToShelfIomA_Policy
Policy Rule Expression: nschm_shelf_info.num-paths == 2
                    nschm_shelf_info.iomb-adapter == NULL
                    Where: -
                    Enable: true
                    Alert ID: ControllerToShelfIomA_Alert
                    Number of Alerts: -
                    Responsible Resource: nschm_shelf_info.name
```

The example below displays detailed information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show -instance
Node: node1
                    Monitor: node-connect
                    Policy: ControllerToShelfIomA_Policy
                    Rule Expression: nschm_shelf_info.num-paths == 2
                    nschm_shelf_info.iomb-adapter == NULL
                    Variable Equivalence: -
                    Policy Status: true
                    Alert ID: ControllerToShelfIomA_Alert
                    Table and ID of Resource at Fault: nschm_shelf_info.name
```

## system health status show

Display system health monitoring status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system health status show` command displays the health monitor status. The possible states are:

- ok
- ok-with-suppressed
- degraded
- unreachable

## Examples

This example displays information about health monitoring status:

```
cluster1::> system health status show
Status
-----
degraded
```

# system health subsystem show

Display the health of subsystems

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system health subsystem show` command displays the health status of each subsystem for which health monitoring is available. This command aggregates subsystem health status from each node in the cluster. A subsystem's health status changes to "degraded" when a health monitor raises an alert. You can use the [system health alert show](#) command to display information about generated alerts.

## Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance ]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-subsystem <hm\_subsystem>] - Subsystem

Selects the specified subsystem.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health**

Selects subsystems that have the specified health status.

**[-init-state {Invalid|Initailizing|Initialized|Starting\_Discovery|Starting\_Re-Discovery|Discovery\_Done\_Partially|Discovery\_Done}] - Initialization State**

Selects subsystems that have the specified initialization state.

**[-outstanding-alert-count <integer>] - Number of Outstanding Alerts**

Selects subsystems that have the specified number of outstanding alerts.

**[-suppressed-alert-count <integer>] - Number of Suppressed Alerts**

Selects subsystems that have the specified number of suppressed alerts.

**[-node {<nodename>|local}] - Node**

Selects subsystems for the specified node.

**[-refresh-interval <[<integer>h][<integer>m][<integer>s]>, ...] - Subsystem Refresh Interval**

The refresh interval is in minutes. A value of zero disables the sub-system refresh until a reboot or restart of the subsystem process.

## Examples

The example below displays the health status of each subsystem:

```
cluster1::> system health subsystem show
Subsystem      Health
-----
SAS-connect    degraded
Switch-Health  OK
CIFS-NDO       OK
```

The example below displays detailed information about the health status of each subsystem:

```
cluster1::> system health subsystem show -instance
Subsystem: SAS-connect
Health: degraded
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
Node: node1,node2
Subsystem Refresh Interval: 30m, 30m
Subsystem: Switch-Health
Health: ok
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
```

```

Node: node1
Subsystem Refresh Interval: 5m
Subsystem: CIFS-NDO
Health: OK
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
Node: node1
Subsystem Refresh Interval: 5m

```

# system license add

Add one or more licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command adds a license to a cluster. To add a license you must specify a valid license key, which you can obtain from your sales representative.

## Parameters

**-license-code <License Code V2>, ... - License Code V2**

This parameter specifies the key of the license that is to be added to the cluster. The parameter accepts a list of 28 digit upper-case alphanumeric character keys.

## Examples

The following example adds a list of licenses with the keys AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA and BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB to the cluster

```
cluster1::> system license add -license-code AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA,
BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
```

# system license clean-up

Remove unnecessary licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command manages licenses in the cluster that have no effect, and so can be removed. Licenses that have expired or are not affiliated with any controller in the cluster are deleted by this command. Licenses that cannot be deleted are displayed with reasons for the non-deletion.

## Parameters

### **[-unused <true>] - Remove unused licenses**

If you use this parameter, the command removes licenses in the cluster that are not affiliated with any controller in the cluster.

### **[-expired <true>] - Remove expired licenses**

If you use this parameter, the command removes licenses in the cluster that have expired.

### **[-n, -simulate <true>] - Simulate Only**

If you use this parameter, the command will not remove the licenses. Instead it will display the licenses that will be removed if this parameter was not provided.

## Examples

The following example simulates and displays the licenses that can be cleaned up:

```
cluster-1::> system license clean-up -expired -unused
```

The following licenses were safely deleted:

Serial number: 1-80-000011

Owner: cdancluster-1

Package	Reason
CIFS	License has expired

Serial number: 4067154888

Owner: none

Package	Reason
Cloud	License has expired

Serial number: 1-81-00000000000000004067154999

Owner: none

Package	Reason
iSCSI	License unused by any node in the cluster

The following licenses are either expired or unused but cannot be safely deleted:

```
Serial number: 4067154778
```

```
Owner: node1
```

```
Package Reason
```

```
-----
Cloud Feature would be impaired upon removal
```

```
Serial number: 4067154779
```

```
Owner: node2
```

```
Package Reason
```

```
-----
Cloud System generated license
```

## system license delete

Delete a license

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command deletes a license from a cluster.

### Parameters

**-serial-number <text> - Serial Number**

This parameter specifies the serial number of the license that is to be deleted from the cluster. If this parameter is not provided, the default value is the serial number of the cluster.

**-package <Licensable Package> - Package**

This parameter specifies the name of the package that is to be deleted from the cluster.

### Examples

The following example deletes a license named CIFS and serial number 1-81-00000000000000000123456 from the cluster:

```
cluster1::> system license delete -serial-number 1-81-00000000000000000123456
-package CIFS
```

The following example deletes from the cluster all of the licenses under the installed-license Core Bundle for serial number 123456789:

```
cluster1::> system license delete { -serial-number 123456789 -installed-license "Core
```

```
Bundle" }
```

# system license show-aggregates

Display status of aggregates leases and license used.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the status of all ONTAP aggregates.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you use this parameter, the command displays information only about aggregates that match the given node.

**[-aggr-name <text>] - Aggregate Name**

If you use this parameter, the command displays information only about aggregate that match the given aggregate.

**[-aggr-size {<integer>[KB|MB|GB|TB|PB]}] - Aggregate Size**

If you use this parameter, the command displays information only about aggregates that match the given physical size of an aggregate.

**[-licensed-size {<integer>[KB|MB|GB|TB|PB]}] - Licensed Size**

If you use this parameter, the command displays information only about aggregates that match the given licensed-size.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Lease Expiration**

If you use this parameter, the command displays information only about aggregates that match the given lease expiration.

**[-status <AggrLicStatus>] - Aggregate Status**

If you use this parameter, the command displays information only about aggregates that match the given status.

**[-compliant {true|false}] - Is Aggregate Compliant**

If you use this parameter, the command displays information only about aggregates that match the given state of compliance.

**[-aggr-uuid <UUID>] - Aggregate UUID**

If you use this parameter, the command displays information only about aggregate that match the given aggregate uuid.

## Examples

The following example displays the license status of the cluster:

```
cluster1::> system license show-aggregates
Licensed Physical
Node      Aggregate                Size      Size Lease Expiration  Status
-----

```

# system license show-serial-numbers

## Display History of Serial Numbers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the history of changes to the support and node serial numbers. The node serial number and the support serial number of an ONTAP system are generally the same and do not change over time. However, when capacity pools licensing is used, the support serial number is that of the capacity pool license serial number and the node serial number is generated by the license manager. Also, when a cluster is upgraded or converted from capacity tiers licensing to capacity pools licensing, its support serial numbers as well as its node serial numbers change.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-seqnum <Sequence Number>] - Sequence number**

Event sequence number

**[-node {<nodename>|local}] - Node**

Selects the node names that match this parameter value.

**[-date <MM/DD/YYYY HH:MM:SS>] - Date**

Selects the dates of serial number changes that match this parameter value.

**[-reason <text>] - Reason for change**

Reasons for serial number changes.

**[-support-serial-number <text>] - Support Serial Number**

Selects the support serial numbers that match this parameter value.

**[-node-serial-number <text>] - Node Serial Number**

Selects the node serial number that match this parameter value.

## Examples

The following example displays the serial number change history of a four node capacity pools

cluster. Its two HA pairs were originally assigned to capacity pools 390000101 and 390000102, and then both were reassigned to another capacity pool 390000103:

```
cluster1::> system license show-serial-numbers

Change Date: 06/06/2019
  Reason: Reassignments of capacity pools
Node          Support Serial    Node Serial
-----
node1         390000103         99939000010100000001
node2         390000103         99939000010100000002
node3         390000103         99939000010200000003
node4         390000103         99939000010200000004

Change Date: 03/01/2019
  Reason: Initial installation
Node          Support Serial    Node Serial
-----
node1         390000101         99939000010100000001
node2         390000101         99939000010100000002
node3         390000102         99939000010200000003
node4         390000102         99939000010200000004
```

The following example displays the history of a four node cluster converted from capacity tiers licensing to capacity pools licensing:

```
cluster1::> system license show-serial-numbers

Change Date: 06/06/2019
  Reason: Conversions from capacity tiers to pools
Node          Support Serial    Node Serial
-----
node1         390000103         99939000010300000011
node2         390000103         99939000010300000012
node3         390000103         99939000010300000013
node4         390000103         99939000010300000014

Change Date: 03/01/2019
  Reason: Initial installation
Node          Support Serial    Node Serial
-----
node1         310000101         310000101
node2         310000102         310000102
node3         310000103         310000103
node4         310000104         310000104
```

The following example displays the history of an evaluation cluster that was upgraded to capacity pools licensing:

```
cluster1::> system license show-serial-numbers
```

```
Change Date: 06/06/2019
```

```
Reason: Conversions from capacity tiers evaluation to pools
```

Node	Support Serial	Node Serial
node1	390000103	99939000010300000011
node2	390000103	99939000010300000012
node3	390000103	99939000010300000013

## system license show-status

Display license status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the status of all Data ONTAP licenses.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**{ [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-status {not-compliant|eval|partially-installed|valid|not-installed|not-applicable|not-known}]**

**- Current State**

If you use this parameter, the command displays information only about licenses that match the given status.

**[-license <Licensable Package>] - License**

If you use this parameter, the command displays information only about licenses that match the given license.

**[-scope {site|cluster|node|pool}] - License Scope**

If you use this parameter, the command displays information only about licenses that match the given scope.

**[-detailed-status <text>,...] - Detailed Status**

If you use this parameter, the command displays information only about licenses that match the given detailed-status.

## Examples

The following example displays the license status of the cluster:

```
cluster1::> system license show-status
Status   License                Scope   Detailed Status
-----
partially-installed
          CIFS                 node    License missing on: Node2-Cluster1.

```

# system license show

## Display licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system license show` command displays the information about licenses in the system.

## Parameters

**{[-fields <fieldname>,...]}**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[-instance ]}**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-serial-number <text>] - Serial Number**

If you use this parameter, the command displays information only about the licenses that matches the serial number you specify.

**[-package <Licensable Package>] - Package**

If you use this parameter, the command displays information only about the specified package.

**[-owner <text>] - Owner**

If you use this parameter, the command displays information only about the packages that matches the owner name you specify.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration**

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

**[-description <text>] - Description**

If you use this parameter, the command displays information only about the licenses that matches the description you specify.

**[-type {license|site|demo|subscr|capacity|capacity-per-term|enabled}] - Type**

If you use this parameter, the command displays information only about the licenses that have the license type you specify.

**[-customer-id <text>] - Customer ID**

If you use this parameter, the command displays information only about the licenses that have the customer-id you specify.

**[-installed-license <text>] - Installed License Name**

If you use this parameter, the command displays information only about the licenses that match the installed license you specify.

**[-host-id <text>] - Host Id**

If you use this parameter, the command displays information only about the license that have the host id you specify.

**[-capacity {<integer>[KB|MB|GB|TB|PB]] - License Capacity**

If you use this parameter, the command displays information only about the licenses that match the capacity you specify.

## Examples

The following example displays information about all licensed packages in the cluster:

```
cluster1::> system license show
```

```
Serial Number: 1-81-0000000000000001122334455
```

```
Owner: node2
```

```
Installed License: Legacy Key
```

```
Capacity: -
```

Package	Type	Description	Expiration
NFS	license	NFS License	-
CIFS	license	CIFS License	-
iSCSI	license	iSCSI License	-
SnapRestore	license	SnapRestore License	-
FlexClone	license	FlexClone License	-
S3	license	S3 License	-

```
Serial Number: 123456789
```

```
Owner: node1
```

```
Installed License: Core Bundle
```

```
Capacity: 10TB
```

Package	Type	Description	Expiration
NFS	capacity	NFS License	-
CIFS	capacity	CIFS License	-
iSCSI	capacity	iSCSI License	-
SnapRestore	capacity	SnapRestore License	-
FlexClone	capacity	FlexClone License	-
S3	capacity	S3 License	-

```
12 entries were displayed.
```

# system license update-leases

Begin lease reconciliation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system license update-leases` command attempts to update (that is, renew) any capacity pool leases that have expired.

## Parameters

**`[-node {<nodename>|local}]` - Nodes to Attempt Renewal**

This optional parameter directs the system to update leases for only the specified nodes.

**`[-force {true|false}]` - Force Renewal of Valid Leases**

This optional parameter, if set with a value of "true", directs the system to update all leases for a node, not just those that have expired.

## Examples

The following example updates all leases on a node:

```
cluster1::*> system license update-leases -node node1 -force true
Number of Leases Updated: 3
Number of Leases Not Updated: 0 (error), 0 (already up-to-date)
```

# system license capacity show

(DEPRECATED)-Show license capacity status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future release of Data ONTAP. Use the "[system license show-status](#)" command.

The `system license capacity show` command displays the information about the licenses in the system that are specifically related to storage capacity limits.

## Parameters

### **{[-fields <fieldname>,...]}**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### **{[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### **[-serial-number <Node Serial Number>] - Serial Number**

If you use this parameter, the command displays information only about the capacity-related licenses that matches the serial number you specify.

### **[-package <Licensable Package>] - Package**

If you use this parameter, the command displays information only about the package you specify.

### **[-owner <text>] - Owner**

If you use this parameter, the command displays information only about the capacity-related licenses that have the owner you specify.

### **[-max-capacity {<integer>[KB|MB|GB|TB|PB]}] - Maximum Capacity**

If you use this parameter, the command displays information only about the capacity-related licenses that have the maximum amount of attached storage capacity you specify.

### **[-current-capacity {<integer>[KB|MB|GB|TB|PB]}] - Current Capacity**

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node with the current attached capacity you specify.

### **[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date**

If you use this parameter, the command displays information only about the capacity-related licenses that have the expiration date you specify.

### **[-reported-state {evaluation|warning|missing|enforcement|installed}] - Reported State**

If you use this parameter, the command displays information only about the capacity-related licenses that have the reported state you specify.

### **[-node {<nodename>|local}] - Node Name**

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node you specify.

## Examples

The following example displays information about all capacity-related licensed packages in the cluster, for a hypothetical cluster of four nodes:

Note that for some nodes below, the maximum capacity is displayed as "-" (meaning "unlimited").

This happens when there is no capacity license for the node - the node is operating with a limited-time temporary capacity license.

```
cluster1::> system license capacity show

Node:          node1
Serial Number: 1-81-0000000000001234567890123456
                Max  Current
Package          Capacity Capacity Expiration
-----
Select          2TB  15.81GB 4/11/2016 00:00:00
Node:          node2

- [system license show-status](#)

# system license license-manager check

Display license manager status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system license license-manager check` checks the connectivity status of a node to the License Manager that the node was configured to use. The status of a node might indicate that the License Manager is inaccessible. If so, the status message contains additional text in parentheses. The text options and descriptions are as follows:

- `license_expired` : The License Manager has a license, but it is expired.
- `network_error` : The node is unable to establish basic network connectivity.
- `no_valid_license` : The License Manager does not have a valid capacity pool license.

All other values indicate an internal error.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ [-instance ] ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This parameter directs the system to display results for the License Manager configured for the specified node.

**[-status <text>] - Status**

This parameter directs the system to display results for the given status message.

## Examples

The following examples check the status of the configured License Manager, before and after its license has expired:

```
cluster1::*> system license license-manager check -node node1
Node: node1
LM status: License Manager (1.2.3.4:5678) is accessible.

cluster1::*> system license license-manager check

Node                Status
-----
node1                License Manager (1.2.3.4:5678) is accessible.
node2                License Manager (1.2.3.4:5678) is accessible.
2 entries were displayed.
cluster1::*> system license license-manager check -node node1
Node: node1
LM status: License Manager (1.2.3.4:5678) is inaccessible (license_expired).

cluster1::*> system license license-manager check

Node                Status
-----
```

```
node1          License Manager (1.2.3.4:5678) is inaccessible (license_expired).
node2          License Manager (1.2.3.4:5678) is inaccessible (license_expired).
2 entries were displayed.
```

## system license license-manager modify

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``system license license-manager modify`` command modifies the configuration information for the License Manager the system is using.

### Parameters

**[-host <text>] - License Manager Host**

Sets the specified host, which can either be a fully qualified domain name (FQDN) or an IP address.

### Examples

The following example modifies information about the License Manager configuration:

```
cluster1::*> system license license-manager modify -host myhost.mycompany.com
```

## system license license-manager show

Display license manager information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``system license license-manager show`` command displays the information about the current License Manager configuration.

### Examples

The following example displays information about current License Manager configuration:

```
cluster1::*> system license license-manager show
```

License Manager Host: 1.2.3.4

# system license status show

(DEPRECATED)-Display license status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future release of Data ONTAP. Use the "[system license show-status](#)" command.

This command displays the list of licensable packages in the system and their current licensing status.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-package <Licensable Package>] - Package Name**

If you use this parameter, the command displays information only about the specified package.

**[-method {none|license|site|demo|subscr|capacity|enabled}] - Licensed Method**

If you use this parameter, the command displays information only about the packages with the specified licensed method.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date**

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

**[-description <text>] - Description**

If you use this parameter, the command displays information only about the licenses that match the description you specify.

**[-status-details <text>] - Additional Information About Status**

This option displays additional information regarding the cluster-level license status for license methods.

## Examples

The following example displays the license status of the cluster:

```
cluster1::> system license status show
Package           Licensed Method  Expiration           Status Details
-----
Base              site             -                    -

## system limits show

Displays the Maximum volume limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command displays the Maximum volumes allowed in a node and maximum allowed size of a volume.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node's filer ID**

This parameter indicates the node name.

**[-max-aggr-size <integer>] - Maximum Aggregate Size in TB**

This parameter indicates the Maximum aggregate size in TB

**[-max-vol-size <integer>] - Maximum Volume Size in TB**

This parameter indicates Maximum Volume Size in TB

**[-max-node-vvols <integer>] - Maximum Number of Volumes**

This parameter indicates the Maximum Number of Volumes

**[-max-hya-ssd-limit <integer>] - Maximum SSD on a Flash Pool Aggregate**

This parameter indicates the Maximum hya ssd limit

**[-is-200tb-vol-size-allowed {true|false}] - Is system allowed to create vvols upto 200TB**

This parameter indicates the whether the volume of size 200TB is allowed

**[-max-vol-size-old <integer>] - Old Maximum Volume Size in TB**

This parameter indicates Maximum Volume Size in TB prior to 9.12.1

## Examples

Example shows the output of system limits show

```
cluster1::> system limits show
      Node           Max_volume_size  Max_volume_count
-----
node1           16                      500
```

## system node halt

Shut down a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node halt** command stops all activity on a node. You may supply a reason for the shutdown, which will be stored in the audit log. You may also keep partner nodes from performing storage takeover during the shutdown.

## Parameters

### **-node {<nodename>|local} - Node**

Use this mandatory parameter to specify the node that you want to shut down. The value **local** specifies the current node.

### **[-reason <text>] - Reason for Shutdown**

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

### **[-f, -inhibit-takeover <true>] - Disallow Storage Takeover by Partner**

This parameter optionally forces the shutdown and prevents storage failover. LIFs will migrate prior to shutdown even when inhibit-takeover is set to **true**. To prevent LIF migration, skip-lif-migration-before-shutdown should be set to **true**. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover.

If -inhibit-takeover is set to true, the default behavior of the [storage failover show`-fields onreboot`](#) command is ignored.

If you enter this command without using this parameter, its effective value is false and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to true and storage takeover is disabled during reboot.

### **[-d, -dump <true>] - Create a Core Dump**

If this parameter is set to true, it forces a dump of the kernel core when halting the node.

### **[-skip-lif-migration-before-shutdown <true>] - Skip Migrating LIFs Away from Node Prior to Shutdown**

If this parameter is specified, LIF migration prior to the shutdown will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the shutdown has occurred. The default is to migrate LIFs prior to the shutdown. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to shutdown. If the migration fails or times out, the shutdown will be aborted.

### **[-ignore-quorum-warnings <true>] - Skip Quorum Check Before Shutdown**

If this parameter is specified, quorum checks will be skipped prior to the shutdown. The operation will continue even if there is a possible data outage due to a quorum issue.

### **[-ignore-strict-sync-warnings <true>] - Skip SnapMirror Synchronous Strict Sync Check Before Reboot**

If this parameter is specified, the check for volumes that are in SnapMirror Synchronous

relationships with policy of type strict-sync-mirror will be skipped. The operation will continue even if there is a possible data outage due to not being able to fully sync data.

### **[-power-off {true|false}] - Power off the node after shutdown**

If this parameter is specified, the node will be powered off at the end of the halt operation.

## Examples

The following example shuts down the node named cluster1 for hardware maintenance:

```
cluster1::> system halt -node cluster1 -reason 'hardware maintenance'
```

## Related Links

- [storage failover show](#)

# system node migrate-root

Start the root aggregate migration on a node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node migrate-root** command migrates the root aggregate of a node to a different set of disks. You need to specify the node name and the list of disks on which the new root aggregate will be created. The command starts a job that backs up the node configuration, creates a new aggregate, set it as new root aggregate, restores the node configuration and restores the names of original aggregate and volume. The job might take as long as a few hours depending on time it takes for zeroing the disks, rebooting the node and restoring the node configuration.

## Parameters

### **-node {<nodename>|local} - Node**

Specifies the node that owns the root aggregate that you wish to migrate. The value **local** specifies the current node.

### **{ -disklist <disk path name>, ... - List of Disks for New Root Aggregate**

Specifies the list of disks on which the new root aggregate will be created. All disks must be spares and owned by the same node. Minimum number of disks required is dependent on the RAID type.

### **-raid-type {raid\_tec|raid\_dp|raid4|raid\_ep} - RAID Type for the New Root Aggregate**

Specifies the RAID type of the root aggregate. The default value is **raid-dp**.

**| -resume <true> - Resume a Failed Migrate Operation }**

Resumes a failed migrate-root operation if the new\_root aggregate is created and the old root aggregate is in the restricted state.

## Examples

The command in the following example starts the root aggregate migration on node node1:

```
cluster1::> system node migrate-root -node node1 -disklist
1.11.8,1.11.9,1.11.10,1.11.11,1.11.12 -raid-type raid-dp
```

# system node modify

Modify node attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node modify** command sets the attributes of a node.

The owner, location, and asset tag attributes are informational only, and do not affect the operation of the node or the cluster. The cluster eligibility attribute marks a node as eligible to participate in a cluster. The epsilon attribute marks a node as the tie-breaker vote if the cluster has an even number of nodes.

Any field of type <text> may be set to any text value. However, if the value contains spaces or other special characters, you must enter it using double-quotes as shown in the example below.

Use the [system node show](#) command to display the field values that this command modifies.

## Parameters

**-node {<nodename>|local} - Node**

This mandatory parameter specifies which node will have its attributes modified. The value "local" specifies the current node.

**[-owner <text>] - Owner**

This optional text string identifies the node's owner. Fill it in as needed for your organization.

**[-location <text>] - Location**

Use this text string to identify the physical location of the node. This text string is optional; fill it in as needed for your organization.

**[-assettag <text>] - Asset Tag**

If your organization uses asset tags to track equipment, you can use this text string to store that tag's value.

**[-eligibility {true|false}] - Eligibility**

This parameter specifies whether the node is eligible to participate in a cluster. If you modify another node's eligibility to false, it will no longer be visible from other nodes in the cluster. If you modify the local node's eligibility to false, the node will no longer be active in the cluster and you will not be able to see any cluster nodes from it.

**[-epsilon {true|false}] - Epsilon**

If specified as true for a node, this value designates the specified node as epsilon for this cluster. In a cluster, only one node can be designated as epsilon at any given time. A node can be designated as Epsilon to add weight to its voting in a cluster with an even number of nodes.

**[-skip-quorum-check-before-eligible <true>] - Skip Quorum Check Before Setting Node Eligible**

If this parameter is specified, quorum checks will be skipped prior to setting a node eligible. When setting a node to eligible, the operation will continue even if there is a possible data outage due to a quorum issue.

**[-skip-quorum-check-before-ineligible <true>] - Skip Quorum Check Before Setting Node Ineligible**

If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

**[-is-diff-svcs {true|false}] - Differentiated Services**

If set to `true` this means that the specified node and its HA partner is part of differentiated services storage infrastructure. The default value for this setting is false.

## Examples

The following example modifies the attributes of a node named node0. The node's owner is set to "IT" and its location to "Data Center 2."

```
cluster1::> system node modify -node node0 -owner "IT" -location "Data Center 2"
```

## Related Links

- [system node show](#)

# system node reboot

Reboot a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node reboot** command restarts a node. You can supply a reason for the reboot, which is stored in the audit log. You can also keep partner nodes from performing storage takeover during the reboot and instruct the rebooted node to create a core dump.

## Parameters

### **-node {<nodename>|local} - Node**

Specifies the node that is to be restarted. The value "local" specifies the current node.

### **[-f, -inhibit-takeover <true>] - Disallow Storage Takeover by Partner**

If set to **true**, this parameter specifies that the node's failover partner is not allowed to take over for the node when the node is rebooted. LIFs will migrate prior to reboot even when inhibit-takeover is set to **true**. To prevent LIF migration, skip-lif-migration-prior-to-reboot should be set to **true**. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover. If you enter this command without using this parameter, its effective value is false and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to true and storage takeover is disabled during reboot.

### **[-reason <text>] - Reason for Reboot**

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

### **[-d, -dump <true>] - Create a Core Dump**

If you would like the node to create a core dump before restarting, specify the **true** value with this parameter. If you enter this command without using this parameter, its effective value is false and the node doesn't create a core dump. If you enter this parameter without a value, it is automatically set to true and the node creates a core dump.

### **[-skip-lif-migration-before-reboot <true>] - Skip Migrating LIFs Away from Node Prior to Reboot**

If this parameter is specified, LIF migration prior to the reboot will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the reboot has occurred. The default is to migrate LIFs prior to the reboot. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to reboot. If the migration fails or times out, the reboot will be aborted.

### **[-ignore-quorum-warnings <true>] - Skip Quorum Check Before Reboot**

If this parameter is specified, quorum checks will be skipped prior to the reboot. The operation will continue even if there is a possible data outage due to a quorum issue.

### **[-ignore-strict-sync-warnings <true>] - Skip SnapMirror Synchronous Strict Sync Check Before Reboot**

If this parameter is specified, the check for volumes that are in SnapMirror Synchronous relationships with policy of type strict-sync-mirror will be skipped. The operation will continue

even if there is a possible data outage due to not being able to fully sync data.

## Examples

The command in the following example restarts the node named cluster1 for a software upgrade:

```
cluster1::> system node reboot -node cluster1 -reason "software upgrade"
```

# system node rename

Rename a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node rename** command changes a node's name. Both the node to be modified and the new name of that node must be specified with the following parameters. This command is best executed from the node that is being renamed, using the **-node local** parameter.

Use the [system node show](#) command to display the names of all the nodes in the current cluster.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies which node you are renaming. The value **local** specifies the current node.

### **-newname <text> - New Name**

Use this parameter to specify the new name of the node.

- The name must contain only the following characters: A-Z, a-z, 0-9, "-" or "\_".
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

## Examples

The following example changes the name of the node named node3 to node4.

```
cluster1::> system node rename -node node3 -newname node4
```

## Related Links

- [system node show](#)

# system node restore-backup

Restore the original backup configuration to the HA target node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node restore-backup** command restores the backup configuration file that is stored on the partner node to the specified target node in an HA pair. The backup configuration file is restored after Data ONTAP has been installed on the target node.

The backup configuration file is stored on the HA partner node while the target node is down. After the target node has been installed, the partner node sends this backup configuration file to the target node through the management network by using the **system node restore-backup** command to restore the original configuration. This procedure is commonly used when replacing the target node's boot device.

The target IP address should be the address of the target node used for netboot installation.

## Parameters

**-node {<nodename>|local} - Node**

Specifies the partner node that sends the backup configuration file to the target node. The value "local" specifies the current node.

**-target-address <Remote InetAddress> - HA Partner IP Address**

Specifies the IP address for the target node.

# system node revert-to

Revert a node to a previous release of Data ONTAP

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node revert-to** command reverts a node's cluster configuration to the given version. After the **system node revert-to** command has finished, the **revert\_to** command must be run from the nodeshell. The **revert\_to** command reverts the filesystem on individual nodes to the target release. Before running **revert-to** in the cluster shell, the target release must be installed on the

node.

## Parameters

### **-node {<nodename>|local} - Node**

Specifies the node that is to be reverted. The value **local** specifies the current node.

### **-version <revert version> - Data ONTAP Version**

Specifies the version of Data ONTAP to which the node is to be reverted.

### **[-check-only <true>] - Capability Check**

If set to **true**, this parameter specifies that the cluster configuration revert should perform checks to verify all of the preconditions necessary for revert-to to complete successfully. Setting the parameter to **true** does not run through the actual revert process. By default this option is set to **false**.

## Examples

The command in the following example reverts cluster configuration of a node named node1 to Data ONTAP version 9.11

```
cluster1::*> system node revert-to -node node1 -version 9.11
```

## system node run-console

Access the console of a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command allows you to access the console of any remote node on the same cluster. The remote access is helpful in situations where the node cannot be booted up or has network issues. This command establishes an SSH session with the Service Processor of a remote node and accesses that node's console over the serial channel. This command works even if Data ONTAP is not booted up on the remote node. You can get back to the original node by pressing Ctrl+D. This command works only on SSH sessions and not on physical console sessions.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies the node whose physical console you want to access.

## Examples

The following example accesses the console of node2 in the same cluster.

```
cluster1::> system node run-console -node node2
Pressing Ctrl-D will end this session and any further sessions you might open on top
of this session.
Type Ctrl-D.
SP-login: admin
Password:

## system node run

Run interactive or non-interactive commands in the nodeshell

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Use the **system node run** command to run certain commands from the nodeshell CLI on a specific node in the cluster. You can run a single nodeshell command from the clustershell that returns immediately, or you can start an interactive nodeshell session from which you can run multiple nodeshell commands.

Nodeshell commands are useful for root volume management and system troubleshooting. Commands that are available through the nodeshell are scoped to a single node in the cluster. That is, they affect only the node specified by the value of the **-node** parameter and do not operate on other nodes in the cluster. To see a list of available nodeshell commands, type '?' at the interactive nodeshell prompt. For more information on the meanings and usage of the available commands, use the **man** command in the nodeshell.

Only one interactive nodeshell session at a time can be run on a single node. Up to 24 concurrent, non-interactive sessions can be run at a time on a node.

When running the nodeshell interactively, exit the nodeshell and return to the clustershell by using the **exit** command. If the nodeshell does not respond to commands, terminate the nodeshell process and return to the clustershell by pressing Ctrl-D.

The **system node run** command is not available from the GUI interface.

An alternate way to invoke the **system node run** command is by typing the **run** as a single word.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the name of the node on which you want to run the nodeshell command. If you specify only this parameter, the command starts an interactive nodeshell session that lasts indefinitely. You can exit the nodeshell to the clustershell by pressing Ctrl-D or by typing the **exit** command.

### **{ [-command <text>,...] - Command to Run**

This optionally specifies the name of a single nodeshell command to run on the specified node. To see a list of available nodeshell commands, type '?' at an interactive nodeshell prompt.

### **[ [-reset <true>] - Reset Existing Connection }**

If this parameter is specified with the **true** value, it terminates any existing interactive nodeshell session on the specified node. The default value is **false**.

## Examples

The following example runs the nodeshell command **sysconfig -V** on a node named node1:

```
cluster1::> system node run -node node1 -command sysconfig -V
volume node1_aggr0 (1 RAID group):
    group 0: 3 disks
```

The following example starts a nodeshell session on a node named node2 and then runs the nodeshell **sysconfig -V** command. The system remains in the nodeshell after running the **sysconfig -V** command.

```
cluster1::> run -node node2
Type 'exit' or 'Ctrl-D' to return to the CLI
node2> sysconfig -V
volume node2_aggr0 (1 RAID group):
    group 0: 3 disks
node2>
```

The following example starts a nodeshell session on a node named node1 and then runs two nodeshell commands, **aggr status** first and **vol status** second. Use quotation marks and semicolons when executing multiple nodeshell commands with a single **run** command.

```
cluster1::> run -node node1 -command "aggr status; vol status"
    Aggr State          Status          Options
    aggr0 online        raid_dp, aggr  root
```

```

parity uninit'd!
32-bit
aggr1 online      raid_dp, aggr
parity uninit'd!
32-bit
Volume State     Status           Options
vol0 online      raid_dp, flex   root, nvfail=on
parity uninit'd!
root_vs0 online  raid_dp, flex   create_ucose=on,
cluster         convert_ucose=on,
parity uninit'd! maxdirsiz=102400

```

## system node show-discovered

Display all nodes discovered on the local network

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system node show-discovered** command displays information about all the detectable nodes on the local cluster network. This includes both nodes in a cluster and nodes that do not belong to a cluster. You can filter the output to show only nodes that do not belong to a cluster or nodes that are in a cluster.

To see a list of values that are in use for a particular field, use the **-fields** parameter of this command with the list of field names you wish to view.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command only displays the fields that you specify.

**[ -instance ] }**

If the **-instance** parameter is specified, the command displays detailed information about each node.

**[ -node <text> ] - Node Name**

This parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all discovered nodes.

**[ -is-in-cluster {true|false} ] - Is in a Cluster**

If this parameter is set to **false**, the command lists only nodes that do not belong to a cluster.

**[-cluster-uuid <UUID>] - Cluster UUID**

Displays information about nodes belonging to the cluster that has the UUID you specify.

**[-cluster-name <text>] - Cluster Name**

Displays information about nodes belonging to the cluster that has the name you specify.

**[-serial-number <text>] - Node Serial Number**

Displays information about the node that has the serial number you specify.

**[-addresses <IP Address>, ...] - Cluster IP Addresses**

Displays information about the node that has the cluster IP addresses you specify.

**[-netmask <IP Address>] - Cluster Address Mask**

Displays information about the nodes that have the netmask address you specify.

**[-nvrmaid <nvrmaid>] - Node NVRAM ID**

Displays information about the node that has the NVRAM ID you specify.

**[-partner-nvrmaid <nvrmaid>] - Partner NVRAM ID**

Displays information about the node that has an HA partner with the NVRAM ID you specify.

**[-model <text>] - Model**

Displays the nodes that have the specified model number.

**[-version <text>] - Software Version**

Displays the nodes that have the specified version of Data ONTAP.

## Examples

The following example displays information about all discovered nodes in the cluster network:

```
cluster1::*> system node show-discovered
Node          Cluster      Addresses      NVRAM ID      Partner NVRAM
-----
4069114-60-0  -            169.254.232.178 4069114600    -
4069114-60-2  -            169.254.79.38   4069114602    -
4069114-60-3  -            169.254.195.76  4069114603    -
cluster1-01   cluster1     169.254.140.39  4069114628    4069114629
cluster1-02   cluster1     169.254.138.137 4069114629    4069114628
```

## system node show

Display the list of nodes in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node show** command displays information about the nodes in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the **-fields** parameter of this command with the list of field names you wish to view. Use the [system node modify](#) command to change some of the field values that this command displays.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -inventory ]**

Use this parameter to display inventory information such as serial numbers, asset tags, system identifiers, and model numbers.

**[ -messages ]**

Use this parameter to display system messages for each node.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information for node names that match this parameter value.

**[-owner <text>] - Owner**

Selects nodes that have owner values that match this parameter value.

**[-location <text>] - Location**

Selects nodes at specific physical locations that match this parameter value.

**[-model <text>] - Model**

Selects nodes that have model numbers that match this parameter value.

**[-serialnumber <text>] - Serial Number**

Selects nodes that have serial numbers that match this parameter value.

**[-assettag <text>] - Asset Tag**

Selects nodes that have asset tags that match this parameter value.

**[-uptime {<seconds>|[<d> days] <hh>:<mm>[:<ss>]}] - Uptime**

Selects nodes that have uptimes that match this parameter value. This parameter is most useful

when used with a range indicator such as less than or greater than, as in:

```
show -uptime >"30 days 00:00"
```

#### **[-nvrleid <nvrleid>] - NVRAM System ID**

Selects nodes that have NVRAM system IDs that match this parameter value.

#### **[-systemid <text>] - System ID**

Selects nodes that have system IDs that match this parameter value.

#### **[-vendor <text>] - Vendor**

Selects nodes that have vendor names that match this parameter value.

#### **[-health {true|false}] - Health**

Selects nodes that have health values that match this parameter value. Specify **true** to display healthy nodes, and **false** to display unhealthy nodes.

#### **[-eligibility {true|false}] - Eligibility**

Selects nodes that have voting eligibility values that match this parameter value.

#### **[-epsilon {true|false}] - Epsilon**

Selects nodes that have epsilon holding designations that match this parameter value. This is useful to find out which node, if any, in the current cluster has been designated as epsilon. Specify **true** to display the node holding epsilon, and **false** to display nodes not holding epsilon.

#### **[-uuid <UUID>] - UUID**

Selects nodes that have the specified universal unique identifiers that match this parameter value.

#### **[-is-diff-svcs {true|false}] - Differentiated Services**

If true, the corresponding node is considered to be part of differentiated services storage infrastructure.

#### **[-is-all-flash-optimized {true|false}] - All-Flash Optimized**

Selects nodes that have "All-Flash Optimized" personality values that match this parameter value. Specify **true** to display nodes which support only SSD drives, and **false** to display nodes which support all kinds of drives.

#### **[-is-capacity-optimized {true|false}] - Capacity Optimized**

Selects nodes that have "Capacity Optimized" personality values that match this parameter value. Specify **true** to display nodes which support only SSD drives with Capacity Optimized personality enabled and set **false** otherwise.

#### **[-is-qlc-optimized {true|false}] - QLC Optimized**

Selects nodes that have "QLC Optimized" personality values that match this parameter value. Specify **true** to display nodes which support only SSD drives with QLC Optimized personality enabled and set **false** otherwise.

**[-is-all-flash-select-optimized {true|false}] - All-Flash Select Optimized**

Selects nodes that have "All-Flash Select Optimized" personality values that match this parameter value. Specify **true** to display nodes which support only SSD drives, and **false** to display nodes which support all kinds of drives.

**[-sas2-sas3-mixed-stack-support {all|direct-attached|bridge-attached|none}] - SAS2/SAS3 Mixed Stack Support**

Selects nodes that have "SAS2/SAS3 Mixed Stack Support" values that match this parameter value. The possible values are:

- **all** : SAS2/SAS3 mixing supported on all stacks
- **direct-attached** : SAS2/SAS3 mixing supported on direct-attached stacks
- **bridge-attached** : SAS2/SAS3 mixing supported on bridge-attached stacks
- **none** : SAS2/SAS3 mixing not supported

## Examples

The following example displays information about all nodes in the cluster:

```
cluster1::> system node show
Node  Health Eligibility Uptime          Model  Owner  Location
-----
node0  true   true           89 days 23:47 MODELXX  IT     Data Center 2
node1  true   true           15 days 22:37 MODELXX             Data Center 2
node2  true   true           15 days 23:00 MODELXX             Data Center 2
node3  true   true           15 days 22:37 MODELXX             Data Center 2
4 entries were displayed.
```

This example displays the locations and model numbers of all nodes that are in physical locations that have names beginning with "Lab":

```
cluster1::> system node show -location lab* -fields location, model
node      location model
-----
node5     Lab 1   MODELXX
node7     Lab 3   MODELXX
node9     Lab 5   MODELXX
```

# system node autosupport invoke-core-upload

Generate and send an AutoSupport message with an existing core file.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport invoke-core-upload** command sends two AutoSupport messages. The first AutoSupport message contains the content relevant to this core upload. This AutoSupport message has subject line with prefix "CORE INFO:". The second AutoSupport message contains the core file specified by the "-core-filename" option. This AutoSupport message has subject line with prefix "CORE UPLOAD:". The command requires that the specified file be present while the AutoSupport message is being transmitted.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent. Defaults to localhost.

### **[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify the text in the subject line of the AutoSupport message.

### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to an alternate destination. Only "http" and "https" protocols are supported. If this parameter is omitted, the message is sent to all the recipients defined by the system node autosupport modify command.

### **[-force <>true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### **[-case-number <text>] - Case Number for This Core Upload**

Use this parameter to specify the optional case number to be associated with this AutoSupport message.

### **-core-filename <text> - The Existing Core Filename to Upload**

Use this parameter to specify the core file to be included in the AutoSupport message. Use the system node coredump show command to list the core files by name.

## Examples

Use this command to list the core files from a node:

```
cluster1::> system node coredump show -node local
Node:Type Core Name                               Saved Panic Time
-----
node:kernel
           core.4073000068.2013-09-11.15_05_01.nz  true  9/11/2013 15:05:01
```

Use this command to invoke an AutoSupport message with the corefile core.4073000068.2013-09-11.15\_05\_01.nz:

```
cluster1::> system node autosupport invoke-core-upload -core-filename
core.4073000068.2013-09-11.15_05_01.nz -node local
```

# system node autosupport invoke-diagnostic

Generate and send an AutoSupport message with diagnostic content from specified subsystems.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node autosupport invoke-diagnostic** command sends an AutoSupport message from a node containing basic content from all subsystems along with troubleshooting and diagnostic content from specified subsystems.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent.

**[-message-subject <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify text sent in the subject line of the AutoSupport message.

**[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to the destination you specify instead of the configured destination. Only "file", "mailto", "http", and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the [system node autosupport modify](#) command.

### **[-force <true>] - Generate and Send Even if Disabled**

This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If "0", then obey the normal "state", "support" and "diagnostic-content-state" flags. If this is "1", then ignore the "state", "support" and "diagnostic-content-state".

### **-subsystems <subsys1,subsys2,...>,... - Subsystems to Collect Basic, Troubleshooting & Diagnostic Content**

Use this mandatory parameter to include basic, troubleshooting, and diagnostic configuration content from the subsystems you specify. Content is collected from the "mandatory" subsystem and the subsystems you specify. You can specify up to four subsystems.

## Examples

The following example sends a diagnostic AutoSupport message from a node named myNode containing information from the "mandatory" subsystem and basic, troubleshooting and diagnostic contents from "raid", "waf" and "ha" subsystems:

```
cluster1::> system node autosupport invoke-diagnostic -node myNode -subsystems
raid,waf,ha
```

## Related Links

- [system node autosupport modify](#)

# system node autosupport invoke-performance-archive

Generate and send an AutoSupport message with performance archives.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport invoke-performance-archive** command sends an AutoSupport message with the performance archives from a node. The command requires that the performance archives in the specified date range be present while the AutoSupport message is being transmitted.

Performance archive upload is not supported when the **-remove-private-data** parameter is enabled. To disable this parameter, use the [system node autosupport modify -remove-private-data false](#) command.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent. The default setting is localhost.

### **[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify the text in the subject line of the AutoSupport message.

### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the system node autosupport modify command.

### **[-force <>true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### **[-case-number <text>] - Case Number for This Performance Archive Upload**

Use this parameter to specify the optional case number to be associated with this AutoSupport message.

### **-start-date <MM/DD/YYYY HH:MM:SS> - Start Date for Performance Archive Dataset**

Use this parameter to specify the start date for the files in the performance archive dataset to be included in the AutoSupport message.

### **{ -end-date <MM/DD/YYYY HH:MM:SS> - End Date for Performance Archive Dataset**

Use this parameter to specify the end date for the files in the performance archive dataset to be included in the AutoSupport message. The end date should be within six hours of the start date.

### **[-duration <[<integer>h][<integer>m][<integer>s]> - Duration of Performance Archive Dataset }**

Use this parameter with start-date to specify the duration of the performance archive dataset to be included in the AutoSupport message. The maximum duration limit is six hours from the start date.

## Examples

Use this command to invoke an AutoSupport message to include the performance archives in the given date range:

```
cluster1::> system node autosupport invoke-performance-archive -node local -start-date
9/12/2013 19:37:24 -end-date 9/12/2013 22:37:24
cluster1::> system node autosupport invoke-performance-archive -node local -start-date
11/21/2013 13:42:09 -duration 6h
```

## Related Links

- [system node autosupport modify](#)

# system node autosupport invoke-splog

Generate and send an AutoSupport message with collected service-processor log files

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport invoke-splog` command sends an AutoSupport message with the Service Processor (SP) or baseboard management controller (BMC) log files from a specified node in the cluster.

## Parameters

### `-remote-node {<nodename>|local}` - Node

Use this parameter to specify the node from which Service Processor log files are to be collected.

### `[-log-sequence <integer>]` - Log File Sequence Number

Use this parameter to specify the sequence number of the Service Processor log files to be collected. If this parameter is omitted, the latest Service Processor log files are collected.

### `[-uri <text>]` - Alternate Destination for This AutoSupport

Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the [system node autosupport modify](#) command.

### `[-force <>true>]` - Generate and Send Even if Disabled

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### `[-full <>true>]` - Full Log Collection

Use this parameter to collect full logs from the SP or BMC.

### `[-show-full-progress <>true>]` - Full Log Collection Progress Status

Use this parameter to find the status of a full log collection from a SP or BMC.

## Examples

Use this command to invoke an AutoSupport message to include the Service Processor log files collected from node cluster1-02.

```
cluster1::> system node autosupport invoke-splog -remote-node cluster1-02
[Job 777] Job succeeded: Log files from the service processor have been
transferred to "/mroot/etc/log/sp/ondemand" on node cluster1-01, and
AutoSupport message has been triggered.
```

```
cluster1::>
```

- [system node autosupport modify](#)

# system node autosupport invoke

Generate and send an AutoSupport message

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport invoke` command sends an AutoSupport message from a node.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent.

**[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify text sent in the subject line of the AutoSupport message. This parameter is not available when the **-type** parameter is set to performance.

**-type {test|performance|all} - Type of AutoSupport Collection to Issue**

Use this parameter to specify the type of AutoSupport collection to issue. There is no default; you must specify a **-type**.

- **test** - The message contains basic information about the node. When the AutoSupport message is received by Fujitsu support personnel, an e-mail confirmation is sent to the system owner of record. This enables you to confirm that the message is being received by Fujitsu support personnel.
- **all** - The message contains all collected information about the node.
- **performance** - The message contains only performance information about the node. This parameter has effect only if performance AutoSupport messages are enabled, which is controlled by the **-perf** parameter of the [system node autosupport modify](#) command.

### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to the destination you specify instead of the configured destination. Only "file", "mailto", "http", and "https" protocols are supported. If this parameter is omitted, the message is sent to all of the recipients defined by the [system node autosupport modify](#) command.

### **[-force <>true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the message even if AutoSupport is disabled on the node.

## Examples

The following example sends a test AutoSupport message from a node named node0 with the text "Testing ASUP":

```
cluster1::> system node autosupport invoke -node node0 -type test -message "Testing ASUP"
```

## Related Links

- [system node autosupport modify](#)

# system node autosupport modify

Modify AutoSupport configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport modify** command modifies the AutoSupport configuration of all the nodes in the cluster.

## Parameters

### **-node {<nodename>|local} - Node**

The AutoSupport configuration will be modified on all nodes in the cluster, even if this parameter is specified.

This parameter is ignored, but retained for CLI backward compatibility.

### **[-state {enable|disable}] - State**

Use this parameter to specify whether AutoSupport is enabled or disabled. The default setting is **enable**. When AutoSupport is disabled, messages are not sent to anyone, including the vendor's

Fujitsu support personnel, your internal support organization, or partners.

### **[-mail-hosts <text>,...] - SMTP Mail Hosts**

Use this parameter to specify up to five SMTP mail hosts through which AutoSupport messages are sent out. This parameter is required if you specify e-mail addresses in the `-to`, `-noteto`, or `-partner-address` parameters or if you specify `smtp` in the `-transport` parameter. Separate multiple mail hosts with commas and do not use spaces in between. The AutoSupport delivery engine attempts to use these hosts for delivery in the order that you specify.

You can optionally specify a port value for each mail server. A port value can be specified on none, all, or some of the mail hosts. The port specification for a mail host consists of a colon (":") and a decimal value between 1 and 65335, and follows the mailhost name (for example, **mymailhost.example.com:5678**). The default port value is **25**.

Also, you can optionally prepend a user name and password combination for authentication to each mail server. The format of the username and password pair is **user1@mymailhost.example.com**. User will be prompted for the password. The username and password can be specified on none, all, or some of the mail hosts.

The default value for this parameter is **mailhost**.

### **[-from <mail address>] - From Address**

Use this parameter to specify the e-mail address from which all the nodes in the cluster send AutoSupport messages. The default is Postmaster. If you require node-specific "from" addresses, enable the `node-specific-from` (privilege: advanced) parameter.

### **[-to <mail address>,...] - List of To Addresses**

Use this parameter to specify up to five e-mail addresses to receive AutoSupport messages that are most relevant for your internal organization. Separate multiple addresses with commas with no spaces in between. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the `-to` parameter of the [system node autosupport trigger modify](#) command. By default, no list is defined.

### **[-noteto <mail address>,...] - (DEPRECATED) List of Noteto Addresses**

This parameter has been deprecated and might be removed in a future version of ONTAP. Instead, use the [event notification create](#) command to map the **important-events** system filter to the newly created event destination. This will send an email notification for all events with a severity of ERROR, ALERT, or EMERGENCY. For events with other severity values, a new event filter needs to be created using the [event filter create](#) command. Filter rules can be added to the filter using the [event filter rule add](#) command. This newly created filter has to be mapped to the event destination.

Use this parameter to specify up to five addresses to receive a short-note version of AutoSupport messages that are most relevant for your internal organization. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. Individual

trigger events can change the default usage of this parameter using the **-noteto** parameter of the **system node autosupport trigger modify** command. By default, no list is defined.

### **[-partner-address <mail address>,...]** - List of Partner Addresses

Use this parameter to specify up to five e-mail addresses to receive all AutoSupport messages including periodic messages. This parameter is typically used for support partners. For this parameter to have effect, the **-mail-hosts** parameter must be configured correctly. By default, no list is defined.

### **[-support {enable|disable}]** - Send AutoSupport Messages to Vendor Support

Use this parameter to specify whether to send all AutoSupport messages to your vendor's Fujitsu support personnel. (Destination information is pre-defined and does not require configuration.) When **-state** is enabled and **-support** is disabled, messages are sent to the addresses specified in the **-to**, **-noteto**, or **-partner-address** parameters but are not sent to your vendor's Fujitsu support personnel. The default is **enable**.

### **[-transport {smtp|http|https}]** - Protocol to Contact Support

Support for **http** transport has been deprecated and might be removed in a future version of ONTAP.

Use this parameter to specify the protocol used to deliver AutoSupport messages to your vendor's Fujitsu support personnel. This parameter applies only when the **-support** parameter is set to **enable**. If you specify **http** or **https** and your network uses a proxy, you must also set the **-proxy-url** parameter. If you specify **smtp**, you must also configure the **-mail-hosts** parameter.

### **[-proxy-url <text>]** - Support Proxy URL

Use this parameter to specify an HTTP or HTTPS proxy if the **-transport** parameter is set to HTTP or HTTPS and your organization uses a proxy. Enter the URL without an **http://** or **https://** prefix. If authentication is required, use the format "[username]@[host][:port]". You will be prompted for the password. The default is an empty string. To specify a proxy that contains a question mark, press ESC followed by the "?". This field can be cleared by setting the value to an empty string using two double quotes ("").

### **[-hostname-subj {true|false}]** - Hostname Subject

Use this parameter to specify whether the hostname of the node is included in the subject line of the AutoSupport message. The default is **false**. This parameter applies only if the **-remove-private-data** parameter is **true**.

### **[-perf {true|false}]** - Performance Data Enable

Use this parameter to specify whether performance data is sent to Fujitsu support personnel and addresses specified in the **-partner-address** parameter. The default is **true**.

### **[-retry-interval <[<integer>h][<integer>m][<integer>s]>]** - Retry Interval

Use this parameter to specify the amount of time to delay before trying to send an AutoSupport message again after a sending failure. Values may end with "s", "m", or "h" to indicate seconds, minutes, or hours, respectively. The minimum interval is 30 seconds and the maximum is 1 day. The default is 4 minutes.

**[-retry-count <integer>] - Retry Count**

Use this parameter to specify the number of times to try resending mail before dropping it. The minimum number is 5 and the maximum is 30. The default is 15 times.

**[-reminder {true|false}] - Reminder Enable**

Use this parameter to enable or disable a reminder message that is sent when AutoSupport is not configured to send messages to Fujitsu support personnel. This reminder is logged as an EMS event called "autosupport.general.reminder" every 24 hours. The default is **true**.

**[-max-http-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum HTTP Size**

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for HTTP and HTTPS transfers. This parameter applies only to messages sent to Fujitsu support personnel and only if the -transport parameter is set to HTTP or HTTPS. Setting the value to 0 disables the delivery size budget. The default is 50 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the -instance parameter.

**[-max-smtp-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum SMTP Size**

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for SMTP (e-mail) transfers. This parameter applies to messages sent to the addresses specified in the -to, -noteto, and -partner-address parameters. If the -transport parameter is set to smtp, this parameter also applies to messages sent to the vendor's Fujitsu support personnel. Setting the value to 0 disables the delivery size budget. The default is 5 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the -instance parameter.

**[-remove-private-data {true|false}] - Remove Sensitive Data**

Use this parameter with the value **true** to remove, encode, or mask sensitive data from AutoSupport attachments and headers. Use this feature to eliminate private data from all AutoSupport messages.

Eliminated data might include: IP addresses, MAC addresses, URIs, DNS names, e-mail addresses, port numbers, node names, Vserver names, cluster names, aggregate names, volume names, junction paths, policy names, user IDs, group IDs, LUNs, NVMe namespaces and qtree names.

The default is **false**.

Changing this value from false to true deletes the AutoSupport history and all files associated with it.

### **[-validate-digital-certificate {true|false}] - Validate Digital Certificate Received**

Use this parameter with the value **true** to force each node to validate digital certificates that it receives. The default is **true**. When this value is true, the certificate might be validated by OCSP. The OCSP validation for these certificates is controlled by [security config ocsf enable -app autosupport](#) and [security config ocsf disable -app autosupport](#).

### **[-ondemand-state {enable|disable}] - AutoSupport OnDemand State**

Use this parameter to specify whether the AutoSupport OnDemand feature is enabled or disabled. The default is **enable**. When AutoSupport OnDemand is enabled, support personnel can remotely trigger new AutoSupport messages, re-send existing AutoSupport messages and decline the delivery of unwanted AutoSupport messages. When this option is disabled, this node will not respond to any AutoSupport OnDemand requests from support personnel.

### **[-ondemand-remote-diagnostics-state {enable|disable}] - AutoSupport OnDemand Remote Diagnostics State**

Use this parameter to specify whether the AutoSupport OnDemand Remote Diagnostics feature is enabled or disabled. The default is **enable**. When AutoSupport OnDemand Remote Diagnostics is enabled, support personnel can remotely trigger new AutoSupport messages on this node to gather information during troubleshooting scenarios. When this option is disabled, support personnel will still be able to re-send existing AutoSupport messages that may not have been transmitted correctly.

### **[-node-specific-from {enable|disable}] - Node-Specific From Address**

Use this parameter to specify whether the "from" e-mail address needs to be node-specific. If enabled, the node-specific "from" e-mail address is generated by prepending the node name and "-" to the configured "from" address. For example, if the node name is "cluster-01" and the "from" parameter is "[prod@company.com](#)", the generated "from" e-mail address is "[cluster-01-prod@company.com](#)".

## Examples

The following example enables AutoSupport on all nodes in the cluster with the following settings:

- SMTP mail host named [smtp.example.com](#).
- E-mail "from" address of [alerts@example.com](#)
- E-mail "to" address of [support@example.com](#)
- AutoSupport messages sent to support personnel
- HTTPS set as transport protocol
- If sending fails, the system will wait 23 minutes before retrying.

```
cluster1::> system node autosupport modify -state enable -mail-hosts smtp.example.com
-from alerts@example.com -to support@example.com -support enable -transport https
```

```
-retry-interval 23m
```

The following examples show how to modify AutoSupport URLs when using IPv6 address literals:

```
cluster1::> system node autosupport modify -mail-hosts [2620:10a:4002:6004::bbbb]:25
```

```
cluster1::> system node autosupport modify -proxy-url  
username:password@[2620:10a:4002:6004::bbbb]:8080
```

# system node autosupport show

Display AutoSupport configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport show` command displays the AutoSupport configuration of one or more nodes.

## Parameters

`{ [-fields <fieldname>, ... ]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-config ]`

Use this parameter to display the retry interval, retry count, throttle, and reminder settings of all nodes in the cluster.

**[ -recent ]**

Use this parameter to display the subject and time of the last AutoSupport message generated by each node in the cluster.

**[ -support-http ]**

Use this parameter to display whether HTTP support is enabled in the cluster, and identify the transport protocol and the support proxy URL used.

**[ -support-smtp ]**

Use this parameter to display whether SMTP (e-mail) support is enabled in the cluster, and identify the transport protocol and the "to" e-mail address used.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node**

The AutoSupport configuration is identical for all nodes in the cluster.

Use this parameter to display detailed information about the node you specify.

**[ -state {enable|disable} ] - State**

Use this parameter to display information only about nodes that have the AutoSupport state you specify.

**[ -mail-hosts <text>, ... ] - SMTP Mail Hosts**

Use this parameter to display information only about nodes that use the mail hosts you specify.

**[ -from <mail address> ] - From Address**

Use this parameter to display information only about nodes that have the "from" e-mail address you specify.

**[ -to <mail address>, ... ] - List of To Addresses**

Use this parameter to display information only about nodes that have the "to" e-mail addresses you specify.

**[ -noteto <mail address>, ... ] - (DEPRECATED) List of Noteto Addresses**

This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to display information only about nodes that send short-note e-mail messages to the e-mail addresses you specify. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device.

**[ -partner-address <mail address>, ... ] - List of Partner Addresses**

Use this parameter to display information only about nodes that have the "partner-address" e-mail addresses you specify. These addresses are not subject to the delivery limitations configured for the "-to" addresses of AutoSupport triggers.

**[-support {enable|disable}] - Send AutoSupport Messages to Vendor Support**

Use this parameter with the value "enable" to display information only about nodes that send AutoSupport messages to your vendor's Fujitsu support personnel. Use this parameter with the value "disable" to display information only about nodes that do not send AutoSupport messages to your vendor's Fujitsu support personnel.

**[-transport {smtp|http|https}] - Protocol to Contact Support**

Use this parameter to display information only about nodes that use the protocol you specify to send AutoSupport messages.

**[-url <text>] - Support URL for HTTP/HTTPS**

Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP and HTTPS POST operations.

**[-put-url <text>] - Support URL for HTTP/S PUT**

Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP PUT operations.

**[-proxy-url <text>] - Support Proxy URL**

Use this parameter to display information only about nodes that use the proxy URL you specify.

**[-support-address <mail address>,...] - Support Address**

Use this parameter to display information only about nodes that use the external support address you specify.

**[-hostname-subj {true|false}] - Hostname Subject**

Use this parameter to display information only about nodes that include their hostname in the "Subject:" line of AutoSupport messages. If the parameter "remove-private-data" is **false**, this parameter has no effect.

**[-perf {true|false}] - Performance Data Enable**

Use this parameter with the value "true" to display information only about nodes that send periodic performance AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not send periodic performance messages.

**[-retry-interval <[<integer>h][<integer>m][<integer>s]>] - Retry Interval**

Use this parameter to display information only about nodes that use the retry interval you specify.

**[-retry-count <integer>] - Retry Count**

Use this parameter to display information only about nodes that use the retry count you specify.

**[-reminder {true|false}] - Reminder Enable**

Use this parameter with the value "true" to display information only about nodes that send messages reminding administrators to enable AutoSupport if AutoSupport is not enabled. Use this parameter with the value "false" to display information only about nodes that do not send reminder messages.

**[-last-subject <text>] - (DEPRECATED) Last Subject Sent**

This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to display information only about nodes whose last AutoSupport message had the "Subject:" line you specify.

**[-last-time <MM/DD/YYYY HH:MM:SS>] - (DEPRECATED) Last Time Sent**

This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to display information only about nodes whose last AutoSupport message was sent at the date and time you specify. Specify the date and time in the format "MM/DD/YYYY HH:MM:SS".

**[-max-http-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum HTTP Size**

Use this parameter to display information only about nodes that limit the maximum size of HTTP transfers to the file size you specify.

**[-max-smtp-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum SMTP Size**

Use this parameter to display information only about nodes that limit the maximum size of SMTP (e-mail) transfers to the file size you specify.

**[-remove-private-data {true|false}] - Remove Sensitive Data**

Use this parameter with the value "true" to display information only about nodes that remove sensitive data from AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not remove sensitive data.

**[-validate-digital-certificate {true|false}] - Validate Digital Certificate Received**

Use this parameter with the value "true" to display information only about nodes that validate digital certificates they receive. Use this parameter with the value "false" to display information only about nodes that do not validate digital certificates.

**[-ondemand-state {enable|disable}] - AutoSupport OnDemand State**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand state you specify.

**[-ondemand-remote-diagnostics-state {enable|disable}] - AutoSupport OnDemand Remote Diagnostics State**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand Remote Diagnostics state you specify.

**[-ondemand-server-url <text>] - AutoSupport OnDemand Server URL**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand Server URL you specify.

**[-node-specific-from {enable|disable}] - Node-Specific From Address**

Use this parameter to display information that matches the specified value - enabled or disabled.

## Examples

The following example displays the AutoSupport configuration for a node named node3:

```
cluster1::> system node autosupport show -node node3
                Node: node3
                State: enable
                SMTP Mail Hosts: smtp.example.com
                From Address: alerts@example.com
                List of To Addresses: support@example.com
                List of Noteto Addresses: -
                List of Partner Addresses: support@partner.com
Send AutoSupport Messages to Vendor Support: enable
                Protocol to Contact Support: https
                Support Proxy URL: support.proxy.example.com
                Hostname Subject: true
                Performance Data Enable: true
                Retry Interval: 4m
                Retry Count: 15
                Reminder Enable: true
                The Transmission Window: 1h
                Last Subject Sent: WEEKLY
                Last Time Sent: 3/1/2019 06:00:03
                Maximum HTTP Size: 50MB
                Maximum SMTP Size: 5MB
                Remove Sensitive Data: false
                Validate Digital Certificate Received: true
                Continue Local Collection while Disabled: true
```

## system node autosupport check show-details

Display detailed status of AutoSupport subsystem

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport check show-details` command displays the detailed status of the AutoSupport subsystem. This includes verifying connectivity to your vendor's AutoSupport destinations by sending test messages and providing a list of possible errors in your AutoSupport configuration settings.

### Parameters

`{[-fields <fieldname>,...]}`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the

specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[`-instance`] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-node <nodename>`] - Node**

Selects the check results that match this parameter value. This parameter specifies the node whose status is being displayed.

### **[`-check-type <Type of AutoSupport Check>`] - AutoSupport Check Type**

Selects the check results that match this parameter value. This parameter specifies the type of AutoSupport check being performed.

### **[`-status {ok|warning|failed|not-run}`] - Status of the Check**

Selects the check results that match this parameter value. This parameter specifies the result of this AutoSupport check.

### **[`-error-detail <text>`] - Detailed Description of Error**

Selects the check results that match this parameter value. This parameter specifies the detailed error message for this AutoSupport check.

### **[`-corrective-action <text>`] - Corrective Action**

Selects the check results that match this parameter value. This parameter specifies a description of how to correct any errors seen as part of this AutoSupport Check

## Examples

The following example displays the detailed status of the AutoSupport subsystem for a node named node2:

```
cluster1::> system node autosupport check show-details -node node2
```

```
Node: node2
```

```
Category: http-https
```

```
  Component: http-put-destination
```

```
    Status: ok
```

```
    Detail: Successfully connected to "support.netapp.com/put".
```

```
Component: http-post-destination
```

```
  Status: ok
```

```
  Detail: Successfully connected to "support.netapp.com/post".
```

```
Category: smtp
```

```
  Component: mail-server
```

```
    Status: ok
```

```
    Detail: Successfully connected to "mailhost.netapp.com".
```

```

Component: mail-server
    Status: ok
    Detail: Successfully connected to "sendmail.domain.com".
Component: mail-server
    Status: ok
    Detail: Successfully connected to "qmail.domain.com".

Category: on-demand
    Component: ondemand-server
    Status: ok
    Detail: Successfully connected to "support.netapp.com/aods".

Category: configuration
    Component: configuration
    Status: ok
    Detail: No configuration issues found.

```

# system node autosupport check show

Display overall status of AutoSupport subsystem

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport status check show` command displays the overall status of the AutoSupport subsystem.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[ -node <nodename> ] - Node`

Selects the nodes that match this parameter value. This parameter specifies the node whose status is being displayed.

`[ -http-status {ok|warning|failed|not-run} ] - Overall Status of AutoSupport HTTP/HTTPS`

**Destinations**

Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport HTTP destination was established.

**[-aod-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport OnDemand Server**

Selects the nodes that match this parameter value. This parameter specifies the detailed description of the connectivity status to the AutoSupport OnDemand Server.

**[-smtp-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport SMTP Destinations**

Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport mailhost was established.

**[-config-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport Configuration**

Selects the nodes that match this parameter value. This parameter specifies whether the AutoSupport configuration check succeeded or not.

**[-warning-text <text>] - Conditional Warning Message**

Selects the nodes that match this parameter value. This parameter specifies how to get more details regarding the status of the AutoSupport subsystem, in case of any errors.

## Examples

The following example displays the overall status of the AutoSupport subsystem on a node named node2:

```
cluster1::> system node autosupport check show -node node2
```

```
On Demand
Server      SMTP      Configuration
-----
ok          ok          ok
```

# system node autosupport destinations show

Display a summary of the current AutoSupport destinations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport destinations show** command displays a list of all message destinations used by AutoSupport. The command provides you with a quick summary of all addresses and URLs that receive AutoSupport messages from all nodes in the cluster.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display only destinations that receive AutoSupport messages from the node you specify.

**[-destinations <text>, ...] - Destinations**

Use this parameter to display only destination lists for nodes that send AutoSupport messages to the destinations you specify.

## Examples

This example displays all of the destinations in use by the current cluster. Each node uses the same destination for HTTP POST, HTTP PUT, and e-mail notifications.

```
cluster1::> system node autosupport destinations show
Node
  Destinations
-----
node1
  https://asuppost.example.com/cgi-bin/asup.cgi
  https://asupput.example.com/cgi-bin/asup.cgi
  support@example.com

node2
  https://asuppost.example.com/cgi-bin/asup.cgi
  https://asupput.example.com/cgi-bin/asup.cgi
  support@example.com
```

## system node autosupport history cancel

Cancel an AutoSupport Transmission.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system node autosupport history cancel** command cancels an active AutoSupport transmission. This command is used to pause or abandon a long running delivery of an AutoSupport message. The cancelled AutoSupport message remains available for retransmission using the system node

[autosupport history retransmit](#) command.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node on which to cancel the AutoSupport message. The default setting is localhost.

### **-seq-num <Sequence Number> - AutoSupport Sequence Number**

Use this parameter to specify the sequence number of the AutoSupport message you want to cancel.

### **[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport**

Use this parameter to specify the destination type for the AutoSupport message you want to cancel.

## Examples

Use this command to cancel the AutoSupport message delivery with seq-num 10 to all destinations.

```
cluster1::> system node autosupport history cancel -node local -seq-num 10
```

Use this command to cancel the AutoSupport message delivery with seq-num 10 via HTTP only.

```
cluster1::> system node autosupport history cancel -node local -seq-num 10  
-destination http
```

## Related Links

- [system node autosupport history retransmit](#)

# system node autosupport history retransmit

Selectively retransmit a previously collected AutoSupport.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport history retransmit** command retransmits a locally stored AutoSupport message.

Support personnel might ask you to run this command to retransmit an AutoSupport message. You might also retransmit an AutoSupport message if you run the [system node autosupport history show](#)

command and notice that a message was not delivered.

If you retransmit an AutoSupport message, and if support already received that message, the support system will not create a duplicate case. If, on the other hand, support did not receive that message, then the AutoSupport system will analyze the message and create a case, if necessary.

Use the [system node autosupport history show](#) command to display the 50 most recent AutoSupport messages, which are available for retransmission.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent.

### **-seq-num <Sequence Number> - AutoSupport Sequence Number**

Use this parameter to specify the sequence number of the AutoSupport message to retransmit.

### **-uri <text> - Destination to Send this AutoSupport**

Use this parameter to specify the HTTP, HTTPS, FILE, or MAILTO uniform resource indicator (URI) to which the AutoSupport message is sent.

### **[-size-limit {<integer>[KB|MB|GB|TB|PB]}] - Transmit Size Limit for this AutoSupport.**

Use this parameter to specify a size limit for the retransmitted AutoSupport message. If the message information exceeds this limit, it will be trimmed to fit the limit you specify. Omit the size limit or set it to 0 to disable it, which is useful to retransmit an AutoSupport message that was truncated by a mail or Web server due to the default size limits.

## Examples

The following example retransmits the AutoSupport message with sequence number 45 on the node "node1" to a support address by e-mail.

```
cluster1::> system node autosupport history retransmit -node node1 -seq-num 45 -uri
mailto:support@example.com
```

## Related Links

- [system node autosupport history show](#)

# system node autosupport history show-upload-details

Display upload details of recent AutoSupport messages

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport history show-upload-details** command displays upload details of the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of upload
- Time Remaining

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

Use this parameter to display the following detailed information about all entries:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of Upload
- Time Remaining

**[-node {<nodename>|local}] - Node**

Use this parameter to display details of AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display details of AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the **-node** parameter to display information about an individual message.

**[-destination {smtp|http|noteto|retransmit}] - Destination for this AutoSupport**

Use this parameter to display details of AutoSupport messages that were sent to the destination type you specify.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Autosupport Compressed Size**

Use this parameter to display details of AutoSupport messages of the compressed size you specify.

**[-percent-complete <integer>] - Percent Complete**

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

**[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload**

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

**[-time-remaining [<integer>h][<integer>m][<integer>s]>] - Time remaining for Upload**

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

## Examples

The following example shows the first three results output by the history show-upload-details command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show-upload-details -node node1
Node      Seq      Destination Size      Percent Complete  Rate      Time Remaining
-----
node1
      13
      smtp      755.9KB  100      142.88KBps  0s

## system node autosupport history show

Display recent AutoSupport messages

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport history show** command displays information about the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport sequence number
- Destination type, such as smtp
- Status of delivery, such as sent-successful
- Attempt count
- Time of last update

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-delivery ]**

Use this parameter to display destination information about each AutoSupport message.

**[ [-detail ]**

Use this parameter to display trigger and subject information about each AutoSupport message.

**[ [-instance ] }**

Use this parameter to display the following detailed information about all entries:

- Trigger event
- Subject of the message
- Delivery URI
- Last error
- Compressed Size
- Decompressed Size
- Total Collection Time (in ms)

**[-node {<nodename>|local}] - Node**

Use this parameter to display only AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display only AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the **-node** parameter to display information about an individual message.

**[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport**

Use this parameter to display only AutoSupport messages that were sent to the destination type

you specify.

### **[-trigger <Message Name>] - Trigger Event**

Use this parameter to display only AutoSupport messages that match the trigger event you specify.

### **[-last-update <MM/DD/YYYY HH:MM:SS>] - Time of Last Update**

Use this parameter to display only AutoSupport messages that were updated most recently at the time you specify. Specify time in "MM/DD/YYYY HH:MM:SS" format.

### **[-status <AutoSupport general status>] - Status of Delivery**

Use this parameter to display only AutoSupport messages with the status you specify. Possible statuses are:

- initializing - The AutoSupport message request is being processed.
- collection-failed - The AutoSupport collection failed. View the 'Last Error' field of this message for more information.
- collection-in-progress - The AutoSupport collection is in progress.
- queued - The AutoSupport message is queued for delivery.
- transmitting - The AutoSupport message transmission is in progress.
- sent-successful - The AutoSupport message was sent successfully.
- ignore - The AutoSupport message was processed successfully, but the trigger event is not configured for delivery to the current destination type.
- re-queued - The AutoSupport message transmission failed, has been re-queued, and will be retried.
- transmission-failed - The AutoSupport message transmission failed, and the retry limit was exceeded.
- ondemand-ignore - The AutoSupport message was processed successfully, but the AutoSupport On Demand server chose to ignore it.

### **[-attempt-count <integer>] - Delivery Attempts**

Use this parameter to display only AutoSupport messages that the system has attempted to send the number of times you specify. This parameter is most useful when given a range, such as ">5".

### **[-subject <text>] - AutoSupport Subject**

Use this parameter to display only AutoSupport messages of the type you specify.

### **[-uri <text>] - Delivery URI**

Use this parameter to display only AutoSupport messages sent to the destination URI you specify.

### **[-error <text>] - Last Error**

Use this parameter to display only AutoSupport messages that failed with the "Last Error" description you specify.

**[-generated-on <MM/DD/YYYY HH:MM:SS>] - Time of Generation**

Use this parameter to display only AutoSupport messages that were generated (collected) at a particular time.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Compressed Size**

Use this parameter to display only AutoSupport messages of the compressed size you specify.

**[-percent-complete <integer>] - Percent Complete**

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

**[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload**

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

**[-time-remaining [<integer>h][<integer>m][<integer>s]>] - Time Remaining for Upload**

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

**[-decompressed-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Decompressed Size**

Use this parameter to display only AutoSupport messages of the decompressed size you specify.

**[-total-time <integer>] - Total Collection Time (ms)**

Use this parameter to display only AutoSupport messages of total collection time you specify. A value is only shown when the collection has completed.

## Examples

The following example shows the first three results output by the history command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show -node node1
Node      Seq      Destination Status      Attempt  Last
          Num      Update
-----
node1     56
          smtp      ignore      1         11/18/2010 01:10:01
          http      re-queued   2         11/18/2010 02:50:07
          noteto    transmitting 1         11/18/2010 01:10:01
          55
          smtp      ignore      1         11/18/2010 00:53:59
          http      sent-successful 3         11/18/2010 01:50:03
          noteto    sent-successful 1         11/18/2010 00:53:59
          54
          smtp      ignore      1         11/17/2010 12:18:58
          http      sent-successful 4         11/17/2010 16:07:22
          noteto    sent-successful 1         11/17/2010 12:18:58
Press <space> to page down, <return> for next line, or 'q' to quit... q
```

9 entries were displayed.

# system node autosupport manifest show

Display AutoSupport content manifest

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport manifest show** command reports what information is contained in AutoSupport messages. The name and size of each file collected for the message is reported, along with any errors.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-content ]**

Use this parameter to display detailed information about the content of the files contained in the report.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display information about only AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display information about only AutoSupport message content with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the **-node** parameter to display information about an individual message.

**[-prio-num <integer>] - Priority Order of Collection**

Use this parameter to display information about only AutoSupport message content with the collection priority you specify. Content is collected in order, by priority number.

**[-subsys <subsys1,subsys2,...>] - Subsystem**

Use this parameter to display information about only AutoSupport message content collected by the AutoSupport subsystem you specify.

**[-cmd-tgt <Execution domain of AutoSupport content>] - Execution Domain for Command**

Use this parameter to display information about only AutoSupport message content produced in the execution domain you specify.

**[-body-file <text>] - The AutoSupport Content Filename for this Data**

Use this parameter to display information about only AutoSupport message content stored in the body file with the file name you specify.

**[-cmd <text>] - Actual Data Being Collected**

Use this parameter to display information about only AutoSupport message content produced by the D-Blade command, BSD command, file, or XML table you specify.

**[-query <text>] - Table Query for XML Collection**

Use this parameter to display information about only AutoSupport message content produced by the table query you specify.

**[-size-collected {<integer>[KB|MB|GB|TB|PB]}] - Number of Bytes Collected**

Use this parameter to display information about only AutoSupport message content collected in files with the file size you specify.

**[-time-collected <integer>] - Collection Time for this Data Item (ms)**

Use this parameter to display information about only AutoSupport message content collected in the amount of time you specify, in milliseconds.

**[-status <AutoSupport manifest collection status>] - Status of this Data Item**

Use this parameter to display information about only AutoSupport message content with the collection status you specify. Possible statuses are:

- **requested** - The AutoSupport request has been added to the queue and is waiting processing by the collector.
- **working** - The AutoSupport collector is actively gathering the needed data.
- **file-not-found** - AutoSupport data collection failed because a necessary file is missing.
- **no-such-table** - The AutoSupport collector was unable to find the requested SMF table.
- **collection-truncated-size-limit** - AutoSupport data was truncated due to size limits, but partial data is available.
- **collection-truncated-file-size-limit** - AutoSupport data for a particular data item or file was truncated due to file size limits, but partial data is available.
- **collection-skipped-size-limit** - AutoSupport data was skipped due to size limits, and no data is available.
- **collection-truncated-time-limit** - AutoSupport data was truncated due to time limits, but partial data is available.
- **collection-skipped-time-limit** - AutoSupport data was skipped due to time limits, and no data is available.
- **delivery-skipped-size-limit** - AutoSupport data was skipped at delivery time due to size

limits.

- **collection-truncated-age** - AutoSupport data for the particular data item or file was truncated due to age, but partial data is available.
- **general-error** - AutoSupport data collection failed. Additional information (if any) is in the Error String field.
- **completed** - AutoSupport data collection is complete, and the AutoSupport message is ready for delivery.
- **content-not-collected-precheck** - AutoSupport content was not collected due to pre-check function violation.
- **content-not-collected-privacy** - AutoSupport content was not collected because the operation is disabled in privacy mode.
- **content-empty** - AutoSupport content was collected successfully, but the output was empty.
- **collection-aborted** - AutoSupport data collection was aborted.

#### **[-error <text>] - Textual Description of Error**

Use this parameter to display information about only AutoSupport message content with the error text you specify. If data collection has failed, the error text contains a description of the failure. If data collection completes **successfully**, this field is empty.

#### **[-content-type <Type of AutoSupport content>] - AutoSupport Content Type for this Data**

Use this parameter to display information about only AutoSupport message content of the type you specify. Types supported are:

- **basic** - Configuration data about this subsystem
- **troubleshooting** - Detailed diagnostic data about this subsystem

#### **[-orig-size-collected {<integer>[KB|MB|GB|TB|PB]}] - Initial Number of Bytes Collected**

Use this parameter to display information about only AutoSupport message content collected in files with the original file size you specify.

#### **[-size-compressed {<integer>[KB|MB|GB|TB|PB]}] - Compressed Size**

Use this parameter to display information about only AutoSupport message content collected in files with the compressed file size you specify.

## Examples

This example displays the content of AutoSupport message number 372 on the node "node1".

```
cluster1::> system node autosupport manifest show -node node1 -seq-num 372
Node           Sequence  AutoSupport  Collected
              Body Filename Size          Status   Error
-----
node1          372
              SYSCONFIG-A.txt  1.73KB completed
              OPTIONS.txt      29.44KB completed
```

```

software_image.xml 7.56KB completed
CLUSTER-INFO.xml 3.64KB completed
autosupport.xml 12.29KB completed

```

## system node autosupport trigger modify

Modify AutoSupport trigger configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use the **system node autosupport trigger modify** command to enable and disable AutoSupport messages for individual triggers, and to specify additional subsystem reports to include if an individual trigger sends an AutoSupport message.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node whose AutoSupport trigger configuration is modified.

**-autosupport-message <Autosupport Message> - EMS Message**

Use this parameter to specify the AutoSupport trigger to modify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

**[-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses**

Use this parameter with the value "enabled" to enable sending AutoSupport messages to the configured "to" addresses.

**[-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses**

This parameter has been deprecated and might be removed in a future version of ONTAP. Instead, use the [event notification create](#) command to map the **important-events** system filter to the newly created event destination. This will send an email notification for all events with a severity of ERROR, ALERT, or EMERGENCY. For events with other severity values, a new event filter needs to be created using the [event filter create](#) command. Filter rules can be added to the filter using the `link:event-filter-rule-add,event filter rule add>>` command. This newly created filter has to be mapped to the event destination.

Use this parameter with the value "enabled" to enable sending short notes to the configured "noteto" addresses.

#### **[-basic-additional <subsys1,subsys2,...>,...]** - Additional Subsystems Reporting Basic Info

Use this parameter to include **basic** content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

#### **[-troubleshooting-additional <subsys1,subsys2,...>,...]** - Additional Subsystems Reporting Troubleshooting Info

Use this parameter to include **troubleshooting** content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

#### **[-suppress {true|false}]** - Suppress all occurrences of this trigger

Use this parameter with the value "true" to suppress the collection when the AutoSupport message is triggered.

## Examples

The following example enables messages to the configured "to" addresses from the **battery.low** trigger on the node **node1**.

```
cluster1::> system node autosupport trigger modify -node node1 -autosupport-message
battery.low -to enabled
```

# system node autosupport trigger show

Display AutoSupport trigger configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node autosupport trigger show** command displays what system events trigger AutoSupport messages. When a trigger event occurs, the node may send an AutoSupport message to a predefined destination, and a short note to another destination. The full AutoSupport message contains detail for troubleshooting. The short message is meant for short pager or SMS text messages.

Use the system node autosupport destinations show command to view available destinations.

## Parameters

### { [-fields <fieldname>, ... ]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### [ [-basic ]

Use this parameter to display which subsystem information is included as **basic** content when the AutoSupport message is triggered.

### [ [-troubleshooting ]

Use this parameter to display which subsystem information is included as **troubleshooting** content when the AutoSupport message is triggered.

### [ [-instance ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### [-node {<nodename>|local}] - Node

Use this parameter to display AutoSupport triggers only on the node you specify.

### [-autosupport-message <Autosupport Message>] - EMS Message

Use this parameter to display only AutoSupport triggers with the name you specify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

### [-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses

Use this parameter with the value "enabled" to display only AutoSupport messages that send full messages to the "to" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send full messages.

### [-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses

This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter with the value "enabled" to display only AutoSupport messages that send short notes to the "noteto" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send short notes.

### [-basic-default <subsys1,subsys2,...>, ...] - Default Subsystems Reporting Basic Info

Use this parameter to display only AutoSupport triggers that include in their messages, by default, **basic** content from the subsystems you specify.

**[-troubleshooting-default <subsys1,subsys2,...>,...] - Default Subsystems Reporting****Troubleshooting Info**

Use this parameter to display only AutoSupport triggers that include in their messages, by default, **troubleshooting** content from the subsystems you specify.

**[-additional-content <Type of AutoSupport content>,...] - Additional Content Flag**

Use this parameter to display only AutoSupport triggers that have been configured to include additional **basic** or **troubleshooting** content.

**[-basic-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Basic Info**

Use this parameter to display only AutoSupport triggers that have been configured to include additional **basic** content from the subsystems you specify.

**[-troubleshooting-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting****Troubleshooting Info**

Use this parameter to display only AutoSupport triggers that have been configured to include additional **troubleshooting** content from the subsystems you specify.

**[-suppress {true|false}] - Suppress all occurrences of this trigger**

Use this parameter with the value "true" to display only AutoSupport messages that have been suppressed.

## Examples

This example shows the first page of output from the command. Note that "q" was pressed at the prompt to quit.

```
cluster1::> system node autosupport trigger show
```

Node	AutoSupport Message	To	Note To	Additional Content
node1	aggr.offline	enabled	enabled	-
node1	aggr.restricted	disabled	enabled	-
node1	aggr.wafliron	disabled	enabled	-

# system node coredump delete-all

Delete all coredumps owned by a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node coredump delete-all** command deletes either all unsaved core dumps or all saved core files on a node. You can specify whether saved core files or unsaved core dumps are deleted by using the optional **-saved** parameter. If the command is issued while a core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

## Parameters

### **-node <nodename> - Node That Owns the Coredump**

This specifies the node from which core files or core dumps are to be deleted.

### **[-type {unsaved-kernel|saved-kernel|kernel|application|all}] - Type of Core to delete**

This parameter specifies the type of core file to be deleted. If the type is *unsaved*, all unsaved core dumps will be deleted. If the type is *saved*, all saved core files will be deleted. If the type is *kernel*, all kernel core files and kernel core dumps will be deleted. If the type is *application*, all application core files will be deleted. If the type is *all*, all core files will be deleted. The default setting is to delete only unsaved kernel core dumps and core files.

## Examples

The following example deletes all unsaved kernel core dumps on a node named *node0*:

```
cluster1::> system node coredump delete-all -node node0
```

# system node coredump delete

Delete a coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node coredump delete** command deletes a specified core dump. If the command is issued while the specified core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

## Parameters

**-node {<nodename>|local}** - Node That Owns the Coredump

This specifies the node from which core files are to be deleted.

**[-type {kernel|ancillary-kernel-segment|application}]** - Coredump Type

This specifies the type of core file to be deleted. If the type is kernel, the specified kernel core file will be deleted. If the type is application, the specified application core file will be deleted.

**-corename <text>** - Coredump Name

This specifies the core file that is to be deleted.

## Examples

The following example deletes a core dump named core.101268397.2010-05-30.19\_37\_31.nz from a node named node0:

```
cluster1::> system node coredump delete -node node0 -corename core.101268397.2010-05-30.19_37_31.nz
```

# system node coredump save-all

Save all unsaved kernel coredumps owned by a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node coredump save-all** saves all unsaved core dumps on a specified node. If the node has already attempted to save the core dump by the value set by the *-save-attempts* parameter, the command prompts you before continuing. The *save-attempts* parameter is set by invoking the command *system node coredump config modify*.

## Parameters

### **-node <nodename> - Node That Owns the Coredump**

This specifies the node on which unsaved core dumps are to be saved.

## Examples

The following example saves all unsaved core dumps on a node named node0:

```
cluster1::> system node coredump save-all -node node0
```

# system node coredump save

Save an unsaved kernel coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node coredump save** command saves a specified core dump. If the node has already attempted to save the core dump by the value specified by the **-save-attempts** parameter, the command prompts you before continuing. The **-save-attempts** parameter is set by invoking the command [system node coredump config modify](#). A saved core dump can be uploaded to a remote site for support analysis; see the [system node coredump upload](#) command man page for more information.

## Parameters

### **-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node on which the core dump is located.

### **-corename <text> - Coredump Name**

This specifies the core dump that is to be saved.

## Examples

The following example saves a core dump named core.101268397.2010-05-30.19\_37\_31.nz on a node named node0:

```
cluster1::> system node coredump save -node node0 -corename core.101268397.2010-05-30.19_37_31.nz
```

# system node coredump show

Display a list of coredumps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node coredump show** command displays basic information about core dumps, such as the core dump name, time of panic that triggered the core dump and whether the core file is saved. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of kernel core files, run the command with `-type kernel`.

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -system ]**

If you specify this parameter, the command displays the following information:

- Node name
- Core dump name
- Core dump ID
- Node that panicked and generated the core
- System ID of the node that panicked and generated the core
- Version of the core

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node That Owns the Coredump**

If you specify both this parameter and the **-corename** parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files on the specified node.

**[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type**

This parameter specifies the type of core files to be displayed. If the type is kernel and the system supports segmented core files, the command displays information about primary kernel core segment files. If the type is kernel and the system does not support segmented core files, the command displays information about full core files. If the type is ancillary-kernel-segment, the command displays information about ancillary kernel core segment files. If the type is application, the command displays information about application core files. If no type is specified, the command displays information about core files of type kernel or application.

**[-corename <text>] - Coredump Name**

If you specify both this parameter and the **-node** parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files that match the specified name.

**[-panic-node <text>] - Node That Generated Core**

If you specify this parameter with a node name, the command displays information only about the core files that were generated when the specified node panicked.

**[-panic-systemid <integer>] - System ID of Node That Generated Core**

If you specify this parameter, the command displays information only about the core files that were generated when the node with the specified system ID panicked.

**[-version <text>] - Data ONTAP Version of Core**

If you specify this parameter, the command displays information only about the core files that match the specified version.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

If you specify this parameter, the command displays information only about the core files that were generated by a panic at the specified time. Specify time in the format of **MM/DD/YYYY HH:MM:SS [+ HH:MM]**. You can use **[+ HH:MM]** to specify the time range within which all core files triggered by a panic are displayed. **[+ HH:MM]** is relative to UTC.

**[-panic-string <text>] - Panic String**

If you specify this parameter, the command displays information only about the core files that match the specified panic string.

**[-is-saved {true|false}] - Saved Core**

If you specify this parameter, the command displays information only about the core dumps that are or are not saved yet to a core file.

**[-is-partial {true|false}] - Partial Core**

If you specify this parameter, the command displays information only about the core dumps that are or are not partially saved.

**[-save-attempts <integer>] - Number of Attempts to Save Core**

If you specify this parameter, the command displays information only about the core dumps that have the specified number of successful or failed save attempts.

**[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed To Save Core**

If you specify this parameter, the command displays information only about the core dumps that need the specified amount of disk space to save into a core file.

**[-size <text>] - Size of Core (bytes)**

If you specify this parameter, the command displays information only about the saved core files that are of the specified size.

**[-md5-data-chksum <text>] - MD5 Checksum of the Compressed Data of Core**

If you specify this parameter, the command displays information only about the saved core files that have the specified MD5 checksum for compressed data of the core.

**[-ancillary-segment-directory <text>] - Directory Holding Ancillary Kernel Core Segments**

If you specify this parameter, the command displays information only about the saved core files that have the specified ancillary segment directory.

## Examples

The following examples display information about the core files:

```
cluster1::> system node coredump show
Node   Core Name                               Saved  Panic Time
-----
node0
  core.101182345.2010-02-01.14_19_08.nz    false  2/1/2010 09:19:08
  Partial Core: false
  Number of Attempts to Save Core: 2
  Space Needed To Save Core: 4.45GB
node1
  core.101268397.2010-05-30.19_37_31.nz    true   5/30/2010 15:37:31
node2
  core.101270930.2010-09-06.18_40_03.nz    true   9/6/2010 14:40:03
node3
  core.101271326.2010-09-06.19_06_18.nz    true   9/6/2010 15:06:18
  core.101271326.2010-09-06.19_09_49.nz    true   9/6/2010 15:09:49
4 entries were displayed.
```

```
cluster1::> system node coredump show -panic-time 9/6/2010 15:00:00+3:00
Node   Core Name                               Saved  Panic Time
-----
node3
  core.101271326.2010-09-06.19_06_18.nz    true   9/6/2010 15:06:18
  core.101271326.2010-09-06.19_09_49.nz    true   9/6/2010 15:09:49
2 entries were displayed.
```

# system node coredump status

Display kernel coredump status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node coredump status** command displays status information about core dumps. The command output depends on the parameters specified with the command. If a core dump is in the process of being saved into a core file, the command also displays its name, the total number of blocks that are to be saved, and the current number of blocks that are already saved.

You can specify additional parameters to display only information that matches those parameters. For example, to display coredump status information about the local node, run the command with the parameter **-node local**.

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -disks ]**

If you specify this parameter, the command displays the following information:

- Node name
- Total number of disks
- Number of spare disks
- Number of disks used
- Number of disks with partial cores

**[ -spraycore ]**

If you specify this parameter, the command displays the following information:

- Node name
- Whether spray cores are supported
- Number of spray-core disks
- Number of spray-core blocks
- Number of disks needed for spray core
- Estimated number of blocks needed for spray core

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all

fields.

### **[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays the following information:

- Node name
- State of the core-dump process
- Space available on the internal file system
- Name of the core being saved, if applicable
- Total number of blocks in the core being saved, if applicable
- Number of blocks currently saved, if applicable
- Type of core dump
- Number of unsaved complete cores on the node
- Number of unsaved partial cores on the node
- Whether spray cores are supported on the node
- Whether any spare disks are available on the node
- Number of disks that have cores
- Number of unsaved cores
- Number of disks that have partial cores
- Number of partial cores
- Number of unused spray-core disks
- Number of spray-core blocks
- Number of disks available for core dumps
- Estimated number of blocks needed for spray core
- Number of disks needed for spray core

### **[-state <text>] - State**

If you specify this parameter, the command displays information only about the nodes that are in the specified core dump state. Possible values include: nocore, idle, init, saving, and waitdump.

### **[-space-available {<integer>[KB|MB|GB|TB|PB]] - Space Available On Internal Filesystem**

If you specify this parameter, the command displays information only about the nodes that have the specified amount of available space, in bytes, on their internal file systems.

### **[-corename <text>] - Name of Core Being Saved**

If you specify this parameter, the command displays information only about the node that is currently saving the specified core file name.

### **[-total-blocks <integer>] - Total Number of Blocks in Core Being Saved**

If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks in the core dump being saved.

**[-blocks-saved <integer>] - Number of Blocks saved**

If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks saved.

**[-type <text>] - Type of Core Dump**

If you specify this parameter, the command displays information only about the nodes that have the specified core dump type. Possible values include zipped, sprayed, and spare.

**[-spraycore-supported {true|false}] - Spray Core Supported on Node**

If you specify this parameter, the command displays information only about the nodes that do or do not support the spray method of dumping core.

**[-spares-available {true|false}] - Spare Disk(s) Available on Node**

If you specify this parameter, the command displays information only about the nodes that do or do not have spare disks available.

**[-disks-used <integer>] - Number of Disks with Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks that contain core dumps.

**[-unsaved-cores <integer>] - Number of Unsaved Complete Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of complete core dumps that are not yet saved into a core file.

**[-partial-disks <integer>] - Number of Disks with Partial Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks with partial core dumps.

**[-partial-cores <integer>] - Number of Unsaved Partial Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of partial core dumps that are not yet saved into a core file.

**[-spraycore-disks <integer>] - Number of Unused Spray Core Disks**

If you specify this parameter, the command displays information only about the nodes that have the specified number of unused spray-core disks.

**[-spraycore-blocks <integer>] - Number of Spray Core Blocks**

If you specify this parameter, the command displays information only about the nodes that have the specified number of spray-core blocks.

**[-numdisks <integer>] - Total Number of Disks Available for Core Dump**

If you specify this parameter, the command displays information only about the nodes that have the specified total number of disks available for core dump.

**[-blocks-needed <integer>] - Estimated Number of Blocks Needed for Spray Core**

If you specify this parameter, the command displays information only about the nodes that have the specified number of estimated blocks needed for the spray method of dumping core.

**[-disks-needed <integer>] - Number of Disks Needed for Spray Core**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks needed for the spray method of dumping core.

**[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Save All Unsaved Cores**

If you specify this parameter, the command displays information only about the nodes that require the specified amount of disk space to save all unsaved core dumps.

**[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes on Root Filesystem**

If you specify this parameter, the command displays information only about the nodes that need to have the specified number of bytes available on the root filesystem after a core dump is saved.

## Examples

The following example displays core dump information about the node named node0:

```
cluster1::> system node coredump status -node node0 -instance
Node: node0
                                State: idle
    Space Available On Internal Filesystem: 132.1GB
        Name of Core Being Saved: -
Total Number of Blocks in Core Being Saved: -
        Number of Blocks saved: -
            Type of core dump: spray
        Number of Unsaved Complete Cores: 0
        Number of Unsaved Partial Cores: 1
    Space Needed To Save ALL Unsaved Cores: 4.81GB
    Minimum Free Bytes On Internal Filesystem: 250MB
```

# system node coredump trigger

Make the node dump system core and reset

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command triggers a Non-maskable Interrupt (NMI) on the specified node via the Service Processor of that node, causing a dirty shutdown of the node. This operation forces a dump of the kernel core when halting the node. LIF migration or storage takeover occurs as normal in a dirty shutdown. This command is different from the `-dump` parameter of the `system node shutdown`, `system node halt`, or `system node reboot` command in that this command uses a control flow through the Service Processor of the remote node, whereas the `-dump` parameter uses a communication channel between Data ONTAP running on the nodes. This command is helpful in cases where Data ONTAP on the remote node is hung or does not respond for some reason. If the panic node reboots back up, then the generated coredump can be seen by using the `system node`

`coredump show` command. This command works for a single node only and the full name of the node must be entered exactly.

## Parameters

`-node {<nodename>|local}` - Node

This parameter specifies the node for which you want to trigger a coredump.

## Examples

The following example triggers a NMI via the Service Processor and causes node2 to panic and generate a coredump. Once node2 reboots back up, the command `system node coredump show` can be used to display the generated coredump.

```
cluster1::> set advanced
```

```
Warning: These advanced commands are potentially dangerous; use them only when
         directed to do so by Fujitsu personnel.
```

```
Do you want to continue? {y|n}: y
```

```
cluster1::*> system node coredump trigger -node node2
```

```
Warning: The Service Processor is about to perform an operation that will cause
         a dirty shutdown of node "node2". This operation can
         cause data loss. Before using this command, ensure that the cluster
         will have enough remaining nodes to stay in quorum. To reboot or halt
         a node gracefully, use the "system node reboot" or "system node halt"
         command instead. Do you want to continue? {yes|no}: yes
```

```
Warning: This operation will reboot the current node. You will lose this login
         session. Do you want to continue? {y|n}: y
```

```
cluster1::*>
```

```
cluster1::> system coredump show
```

Node:Type	Core Name	Saved	Panic Time
node2:kernel	core.1786429481.2013-10-04.11_18_37.nz	false	10/4/2013 11:18:37
	Partial Core: false		
	Number of Attempts to Save Core: 0		
	Space Needed To Save Core: 3.60GB		

```
1 entries were displayed.
```

```
cluster1::>
```

# system node coredump upload

(DEPRECATED)-Upload a coredump to a remote site

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and might be removed in a future release of Data ONTAP. Use "[system node autosupport invoke-core-upload](#)" instead.

The **system node coredump upload** command uploads a saved core file to a specified URL. You should use this command only at the direction of Fujitsu support personnel.

## Parameters

### **-node {<nodename>|local}** - Node That Owns the Coredump

This specifies the node on which the core file is located.

### **[-type {kernel|ancillary-kernel-segment|application}]** - Coredump Type

This specifies the type of core files to be uploaded. If the type is kernel, kernel core files will be uploaded. If the type is application, application core file will be uploaded.

### **-corename <text>** - Coredump Name

This specifies the name of the core file that is to be uploaded.

### **[-location <text>]** - URL for Coredump Upload Directory

This specifies the URL to which the core file is to be uploaded. If this parameter is not specified, the command uploads the core file to the location specified by the **-upload-location** parameter of the [system node coredump config modify](#) command. The following protocols are supported: ftp and http. (By default, the location is set to <ftp://ftp.netapp.com/to-ntap/>)

### **[-casenum <integer>]** - Case Number

This specifies the support case number that will be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

## Examples

The following example uploads a core file named core.07142005145732.2010-10-05.19\_03\_41.nz on a node named node0 to the default location. The support case number is 2001234567.

```
cluster1::> system node coredump upload -node node0 -corename
core.07142005145732.2010-10-05.19_03_41.nz -casenum 2001234567
```

- [system node coredump config modify](#)

# system node coredump config modify

Modify coredump configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node coredump config modify** command modifies the cluster's core dump configuration.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node whose coredump configuration you want to modify.

**[-sparsecore-enabled {true|false}] - Enable Sparse Cores**

If you set this parameter to true, the command enables sparse cores. A sparse core omits all memory buffers that contain only user data.

**[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes On Root Filesystem**

If you specify this parameter, the command displays the number of bytes that need to be made available in the root file system after saving the core dump. If the minimum number of bytes cannot be guaranteed, core dumps are not generated. The default setting is 250 MB.

**[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core**

If you specify this parameter, the command displays the maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures. The default setting is 2.

**[-save-attempts <integer>] - Maximum Number Attempts to Save Core**

If you specify this parameter, the command displays the maximum number of times the system

will attempt to save a core dump. The default setting is 2.

### **[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup**

If you set this parameter to true, the system will automatically start saving the core dump after reboot.

### **[-upload-location <text>] - URL for Coredump Upload Directory**

This option is deprecated and might be removed in a future release of Data ONTAP. Use the `-uri` parameter of the "[system node autosupport invoke-core-upload](#)" command instead.

If you specify this parameter, the system uploads the core dumps to the specified URL. The following protocols are supported: ftp and http. (The default setting is <ftp://ftp.netapp.com/tontap/>.)

## Examples

The following example sets the maximum number of core dump attempts to 5 and the maximum number of save attempts to 5:

```
cluster1::> system node coredump config modify -coredump-attempts 5 -save-attempts 5
```

## Related Links

- [system node autosupport invoke-core-upload](#)

# system node coredump config show

Display coredump configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node coredump config show` command displays basic information about a cluster's core dump configuration, such as whether sparse cores are enabled, minimum number of free bytes on the root volume file system that need to be available after saving the core files, maximum number of times the process attempts to generate a core dump when encountering repeated disk failures, maximum number of times the process attempts to save a core dump, the URL to which core dumps are uploaded, and whether core dumps are automatically saved when a node restarts.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays the coredump configuration information of the specified node.

**[-sparsecore-enabled {true|false}] - Enable Sparse Cores**

If you specify this parameter, the command displays only the coredump information that matches the specified spare core setting. A sparse core omits all memory buffers that contain only user data.

**[-min-free {<integer>[KB|MB|GB|TB|PB]]] - Minimum Free Bytes On Root Filesystem**

If you specify this parameter, the command displays only the core dump information that matches the specified number of bytes that need to be made available in the root file system after saving the core dump.

**[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core**

If you specify this parameter, the command displays only the core dump information that matches the specified maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures.

**[-save-attempts <integer>] - Maximum Number Attempts to Save Core**

If you specify this parameter, the command displays only the coredump information that matches the maximum number of times the system will attempt to save a core dump.

**[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup**

If you specify this parameter, the command displays only the coredump information that matches the specified configuration of whether the system will automatically start saving the core dump after reboot.

**[-upload-location <text>] - URL for Coredump Upload Directory**

This option is deprecated and might be removed in a future release of Data ONTAP. Use the **-uri** parameter of the "[system node autosupport invoke-core-upload](#)" command instead.

If you specify this parameter, the command displays only the core dump information that matches the specified URL where core dumps are uploaded.

## Examples

The following example displays information about the cluster's core dump configuration:

```
cluster1::> system node coredump config show
      Sparse      Min      Max      Max On
      Core      Free      Dump      Save Startup
Node Enabled      Bytes Attempts Attempts Enabled Coredump Location
-----
node0
  true      250MB      2      2 true      ftp://ftp.example.com/to-example/
node1
  true      250MB      2      2 true      ftp://ftp.example.com/to-example/
node2
  true      250MB      2      2 true      ftp://ftp.example.com/to-example/
node3
  true      250MB      2      2 true      ftp://ftp.example.com/to-example/
4 entries were displayed.
```

# system node coredump external-device save

Save a core dump to an external USB device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node coredump external-device save** command saves a specified core dump to an external USB device plugged into the port specified by the **-device** parameter.

External USB device requirements:

- A device formatted with the FAT32 filesystem.
- A device formatted with the ext2 filesystem with the largefile flag set. + This can be done using the following command on a Linux host: `mkfs.ext2 -T largefile <device_name>`
- The command [system node coredump show](#) can be used to determine the size of the core dump.

## Parameters

**-node {<nodename>|local}** - Node That Owns the Coredump

This specifies the node on which the core dump is located.

**-device {usb0|usb1}** - Device

This specifies which external USB device connected to the node to save the core dump, for

example: usb0. Currently, only usb0 is supported. + usb0 refers to the first external USB device connected to the node (regardless of port).

### **-corename <text> - Coredump Name**

This specifies the core dump that is to be saved.

## Examples

The following example saves a core dump named core.101268397.2010-05-30.19\_37\_31.nz on node1 to external USB device usb0:

```
cluster1::> system node coredump external-device save -node node1 -device usb0
-corename core.101268397.2010-05-30.19_37_31.nz
```

## Related Links

- [system node coredump show](#)

# system node coredump external-device show

Display a list of files on an external USB device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node coredump external-device show** command displays basic information about files on an external USB device, such as the filename and size.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**-node {<nodename>|local} - Node That Owns the Coredump**

This parameter selects the node that has files that are to be displayed on the external USB device.

**[-device {usb0|usb1}] - Device**

This parameter specifies the name of the external USB device, for example: usb0. Currently, only

usb0 is supported. + usb0 refers to the first external USB device connected to the node (regardless of port).

#### **[-corename <text>] - Coredump Name**

This parameter specifies the core dump file for which the information is displayed.

#### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Core**

If specified, the command displays information only about the core files that are of the specified size.

## Examples

The following example displays information about core files stored on external USB devices:

```
cluster1::> system node coredump external-device show
Node                Device  Coredump Name
-----
node1               usb0    core.537051938.2017-10-26.23_52_15.nz
                Size: 13074695581 bytes (12.18) GB
```

# system node coredump reports delete

Delete an application core report

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node coredump reports delete` command deletes the specified application core report.

## Parameters

#### **-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node from which reports are to be deleted.

#### **-reportname <text> - Report Name**

This specifies the report that is to be deleted.

## Examples

The following example shows how a report named `notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report` is deleted from a node named `node0`:

```
cluster1::> system node coredump reports delete -node node0 -reportname
```

```
notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report
```

# system node coredump reports show

Display a list of application core reports

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node coredump reports show** command displays basic information about application core reports, such as the report name and time of the panic that triggered the application core dump. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of reports in the local node, run the command with `-node local`.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node That Owns the Coredump**

Selects information about all the reports on the specified node. If you specify both this parameter and the `-reportname` parameter, the command displays detailed information about the specified report.

**[ -reportname <text> ] - Report Name**

Selects information about the reports that match the specified name. If you specify both this parameter and the `-node` parameter, the command displays detailed information about the specified report.

**[ -panic-node <text> ] - Node That Generated Core**

Selects information about the reports that were generated by the specified node.

**[ -panic-systemid <integer> ] - System ID of Node That Generated Core**

Selects information about the reports that were generated by the node with the specified system ID.

**[ -version <text> ] - Data ONTAP Version of Core**

Selects information about the reports that match the specified version.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

Selects information about the reports that were generated by a panic at the specified time. Specify time in the format of **MM/DD/YYYY HH:MM:SS [+ HH:MM]** . You can use **[+ HH:MM]** to specify the time range within which all core files triggered by a panic are displayed. **[+ HH:MM]** is relative to UTC.

**[-panic-string <text>] - Panic String**

Selects information about the reports that match the specified panic string.

## Examples

The following example displays information about the reports:

```
cluster1::> system node coredump reports show
Node      Report Name                               Panic Time
-----
node0     notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report  3/25/2011 09:59:43
```

# system node coredump reports upload

(DEPRECATED)-Upload an application core report to a remote site

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and might be removed in a future release of Data ONTAP. See core report information in the SmartSoft tool.

The **system node coredump reports upload** command uploads an application report to a specified URL. You should use this command only at the direction of Fujitsu support personnel.

## Parameters

**-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node on which the report is located.

**-reportname <text> - Report Name**

This specifies the name of the report that is to be uploaded.

**[-location <text>] - URL for Coredump Upload Directory**

This specifies the URL to which the report is to be uploaded. The following protocols are supported: ftp and http. (By default, the location is set to <ftp://ftp.netapp.com/to-ntap/>)

**[-casenum <integer>] - Case Number**

This specifies the support case number that is be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

## Examples

The following example shows how a report named notifyd.1894.80335005.2011-03-25.09\_59\_43.ucore.bz2 is uploaded on a node named node0 to the default location. The support case number is 2001234567.

```
cluster1::> system node coredump reports upload -node node0 -corename
notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 -casenum 2001234567
```

# system node coredump segment delete-all

Delete all core segments on a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command deletes all the core segments on a node.

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node on which to delete the core segments.

## Examples

This deletes all the core segments for **node1** .

```
cluster1::> system node coredump segment delete-all -node node1
```

# system node coredump segment delete

Delete a core segment

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command deletes a core segment.

## Parameters

### **-node {<nodename>|local} - Node**

This specifies the node on which to delete the core segments.

### **-segment <text> - Core Segment**

This specifies the core segment to delete. The pathname is relative to the coredump directory. If a directory is specified, all core segment files within it are deleted. If the directory is empty, it is deleted.

### **[-owner-node <text>] - Node That Owns the Core Segment File**

This specifies the node that owns the core segment. Use this parameter only in takeover mode to delete a partner's coredump segment.

## Examples

This deletes all core segments in the directory, **core.151708240.2012-01-11.05\_56\_52** .

```
cluster1::> system node coredump segment delete -node node1 -segment
core.151708240.2012-01-11.05_56_52
```

## system node coredump segment show

Display a list of core segments

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the following information about core segments:

- name of the core segment directory
- time of the panic that generated the core segment
- total number of core segment files
- core segment file name

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

Displays the following details:

- Core segment file name
- Node that owns the core segment file
- System ID of the node that generated the core
- MD5 checksum of the compressed data of the core segment file
- Name of the core segment
- Total number of core segments for the core file
- Timestamp of the panic that triggered the core segment

**[-node {<nodename>|local}] - Node**

Selects information about the core segments on the specified node.

**[-segment <text>] - Core Segment**

Selects information about the specified core segment. If segment is a directory, the command displays the information for the first core segment file. If segment is a file, the command displays the file information.

**[-owner-node <text>] - Node That Owns the Core Segment File**

Selects information about the core segments owned by the specified node. This parameter should only be used in takeover mode to display information about the partner's core segments.

**[-panic-system-id <integer>] - System ID of Node That Generated Core**

Selects information about the core segments that were generated when the node with the specified system ID panicked.

**[-md5-data-chksum <text>] - Md5 Checksum of the Compressed Data of the Core Segment**

Selects information about the core segments whose data segment's MD5 checksum matches the specified checksum.

**[-segment-name <text>] - Name of the Core Segment**

Selects information about the core segments with the specified name.

**[-total-segment-count <integer>] - Number of Segments Generated**

Selects information about the core segments with the specified name.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

Selects information about the core segments that were generated by a panic at the specified time.

**[-size <text>] - Size of Core Segment (bytes)**

Selects information about the core segments that are of the specified size.

**[-panic-string <text>] - Panic String of Panic That Generated Core**

Selects information about the core segments that match the specified panic string.

## Examples

The example below displays the core segments on **node1**.

```
cluster1::> system node coredump segment show -node node1
Node: node1
Segment Directory: core.118049106.2012-01-05.17_11_11
                  Panic Time: 1/5/2012 12:11:11
                  Number of Segments: 2
                  Segment File Name:
                                core.118049106.2012-01-05.17_11_11.nvram.nz
                                core.118049106.2012-01-05.17_11_11.ontap.nz
2 entries were displayed.
```

The example below displays detailed information a specific core segment file on **node1**.

```
cluster1::> system node coredump segment show -node node1 -segment
core.118049106.2012-01-05.17_11_11.ontap.nz -instance
Node: node1
                                Core Segment: core.118049106.2012-01-
05.17_11_11.ontap.nz
                                Node That Owns the Core Segment File: node1
                                System ID of Node That Generated Core: 118049106
Md5 Checksum of the Compressed Data of the Core Segment:
1a936d805dcd4fd5f1180fa6464fdee4
                                Name of the Core Segment: ontap
                                Number of Segments Generated: 2
                                Time of Panic That Generated Core: 1/5/2012 12:11:11
```

## system node environment sensors show

Display the sensor table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node environment sensors show** command displays the following information:

- Node name
- Sensor name
- Sensor state
- Sensor value
- Sensor units
- Critically Low threshold for the sensor
- Warning Low threshold for sensor
- Warning High threshold for sensor
- Critically High threshold for the sensor
- FRU name (detailed view only)

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about the sensors on the specified node. If this parameter is specified with the **-name** parameter, the command displays information only about the specified sensor.

**[-name <text>] - Sensor Name**

Selects information about the sensors that have the specified name. If this parameter is specified with the **-node** parameter, the command displays information only about the specified sensor.

**[-fru <text>] - FRU**

Selects information about the sensors associated with the specified Field Replaceable Unit (FRU).

**[-type {fan|thermal|voltage|current|battery-**

**life|discrete|fru|nvram|counter|minutes|percent|agent|unknown}] - Sensor Type**

Selects information about the sensors that have the specified sensor type. Possible values vary among platforms but may include **fan**, **temperature**, **thermal** and **voltage**.

**[-units <text>] - Value Units**

Selects information about the sensors that have readings displayed in the specified units of measure. Possible values vary among platforms but may include **RPM**, **C** and **mV**.

**[-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown}] - Sensor State**

Selects information about the sensors that have the specified state. Possible values vary among

platforms but may include **normal** , **warn\_lo** , **warn\_hi** , **crit\_lo** , **crit\_hi** and **failed** .

**[-discrete-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown}] - Discrete Sensor State**

Selects information about the discrete-valued sensors that are in the specified state. A discrete-valued sensor has a set of possible discrete values rather than a range of possible values. For example, a presence sensor which has the discrete values PRESENT and NOT\_PRESENT is a discrete-valued sensor. Possible values vary among platforms but may include **normal** and **failed** .

**[-value <integer>] - Last Sensor Value**

Selects information about the sensors that have the specified sensor value.

**[-discrete-value <text>] - Discrete Sensor Value**

Selects information about the discrete-valued sensors that have the specified discrete value. Possible values vary among sensors but may include **PRESENT** , **NOT\_PRESENT** , **ON** , **OFF** , **OK** and **FAULT** .

**[-crit-low <integer>] - Critical Low Threshold**

Selects information about the sensors that have the specified critically low threshold.

**[-warn-low <integer>] - Warning Low Threshold**

Selects information about the sensors that have the specified warning-low threshold.

**[-warn-hi <integer>] - Warning Hi Threshold**

Selects information about the sensors that have the specified warning-high threshold.

**[-crit-hi <integer>] - Critical Hi Threshold**

Selects information about the sensors that have the specified critically high threshold.

**[-inactive {true|false}] - Show Inactive Sensors**

Specify **true** to include inactive sensors in the output. By default, only sensors with the value **false** are shown.

**[-hidden {true|false}] - Show Hidden Sensors**

Specify **true** to include hidden sensors in the output. By default, only sensors with the value **false** are shown.

## Examples

The following example displays information about all sensors on a cluster named cluster1:

```
cluster1::> system node environment sensors show
Node Sensor           State Value/Units Crit-Low Warn-Low Warn-Hi Crit-Hi
-----
mynode
  Partner IO Pre

## system node external-cache modify

Modify external cache settings.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system node external-cache modify** command can be used to modify the following attributes of external-cache for a node:

- is-enabled
- is-rewarm-enabled
- is-mbuf-inserts-enabled
- pcs-size
- is-hya-enabled

## Parameters

### **-node {<nodename>|local} - Node**

This specifies the node on which the modifications need to be made.

### **[-is-enabled {true|false}] - Is Enabled?**

Enables external-cache module (Flash Cache Family) on the storage system. Valid values for this option are true and false. If external-cache hardware is present, then this option will enable external-cache functionality in WAFL. If no hardware is present, this option will enable external-cache pcs (Predictive Cache Statistics). The default value for this option is false.

### **[-is-rewarm-enabled {true|false}] - Is Rewarm On?**

Specifies whether an external-cache module should attempt to preserve data across reboots. Valid values for this option are true and false. This option applies only to cache hardware with persistent media. It does not apply to Predictive Cache Statistics (PCS). Enabling this option will marginally increase the duration of system boot and shutdown, but it will reduce or eliminate the time required for cache warming. The default value for this option is determined by the cache hardware type. The option is disabled by default.

### **[-is-mbuf-inserts-enabled {true|false}] - Is Mbuf Inserts On?**

Specifies whether the external-cache module allows insert of mbuf data as part of a network write. In rare cases, inserting mbuf data may cause excessive CPU usage. We provide this workaround to disable the behavior, if necessary. Do not change the value of this option unless directed to do so by Fujitsu support personnel. The data from the mbuf network writes can still be stored in the external cache, but only after a subsequent disk read of that data.

### **[-pcs-size <integer>] - PCS Size**

Controls the size of the cache emulated by external-cache PCS. Valid values for this option are integers between 16 and 16383. This option is only used when PCS is enabled. The default value for this option is chosen automatically based on the amount of memory in the controller, and the upper limit is further restricted on controllers with smaller amounts of memory.

### **[-is-hya-enabled {true|false}] - Is HyA Caching Enabled?**

Specifies whether the external-cache module allows caching of blocks targeted for hybrid aggregates. This option is set to true by default when the external-cache is enabled.

## Examples

```
cluster::> system node external-cache modify -node node1 -is-enabled true
```

The command enables the external-cache feature on **node1**.

## system node external-cache show

Display external cache settings.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system node external-cache show** command displays external-cache information for each of the nodes available.

### Parameters

**{ [-fields <fieldname>, ... ] }**

Valid values for this option are {**node|is-enabled|is-rewarm-enabled|is-mbuf-inserts-enabled|pcs-size|is-hya-enabled**}. Specifying the value will display all entries that correspond to it.

**[ [-instance ] ] }**

This option does not need an input value. Specifying this option will display the information about all the entries.

**[-node {<nodename>|local}] - Node**

Specify this parameter to display external-cache parameters that match the specified node.

**[-is-enabled {true|false}] - Is Enabled?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-is-rewarm-enabled {true|false}] - Is Rewarm On?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-is-mbuf-inserts-enabled {true|false}] - Is Mbuf Inserts On?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-pcs-size <integer>] - PCS Size**

Valid values for this option are integers between 16 and 16383. Specifying the value will display all entries that correspond to it.

## **[-is-hya-enabled {true|false}] - Is HyA Caching Enabled?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

## Examples

```
cluster1::> system node external-cache show -node node1
Node: node1
    Is Enabled: false
    Is rewarm on: false
    Is Mbuf inserts on: true
    PCS size: 256
Is hya caching enabled: true
```

Displays the external-cache information about **node1** in a list format.

# system node firmware download

Download motherboard firmware and system diagnostics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node firmware download** command downloads new system firmware to the boot device. A reboot followed by the 'update\_flash' command at the firmware prompt is required for the firmware to take effect.

## Parameters

### **-node {<nodename>|local} - Node**

This specifies the node or nodes on which the firmware is to be updated.

### **-package <text> - Package URL**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, HTTPS, FTP and FILE, are accepted. The FILE URL scheme can be used to specify location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as **file://usb0/<filename>** . Typically, the file name is **image.tgz** . The package must be present in the root directory of the USB mass storage device. The HTTPS URL scheme requires that you install the HTTPS server certificate on the system by using the command "security certificate install -type server-ca".

## Examples

The following example downloads firmware to node-01 from a web server:

```
cluster1::*> system node firmware download -node node-01 -package
http://example.com/serviceimage.zip
```

# system node hardware nvram-encryption modify

Configure NVRAM device encryption

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node hardware nvram-encryption modify** command configures the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

This feature might be restricted in some countries due to local regulations concerning encrypted data.

## Parameters

**-node {<nodename>|local} - Node**

Specifies the node containing the NVRAM or NVMEM subsystem.

**[-is-enabled {true|false}] - Is Encryption Enabled**

Specifies whether the NVRAM or NVMEM encryption is disabled or enabled.

## Examples

The following commands enable or disable the NVRAM encryption:

```
cluster1::> system node hardware nvram-encryption modify -node node1 -is-enabled
false
      cluster1::> system node hardware nvram-encryption modify -node node1 -is
-enabled true
```

# system node hardware nvram-encryption show

Show NVRAM device encryption information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node hardware nvram-encryption show` command displays the configuration of the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

If this parameter is specified, the command displays information about the NVRAM encryption configuration on the specified node.

`[-nvram-device-name <text>] - NVRAM Device Name`

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the specified NVRAM device. Current platforms only support one device - NVRAM.0.

`[-is-supported {true|false}] - Is Encryption Support`

If this parameter is specified, the command displays information about the NVRAM encryption configuration for platforms that support it.

`[-is-enabled {true|false}] - Is Encryption Enabled`

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the NVRAM or NVMEM devices where the device has the specified enabled value.

`[-key-id <text>] - Key ID of the Encryption Key`

If this parameter is specified, the command displays information about the NVRAM encryption configuration with the specified encryption Key ID used to encrypt the NVRAM or NVMEM data on flash storage.

## Examples

The following example displays information about the NVRAM encryption configuration on all nodes of the cluster:

```
cluster1::> system node hardware nvram-encryption show
```

**[-wwn <text>] - World Wide Name**

Selects information about the tape drive that has the specified worldwide name.

**[-serial-number <text>] - Serial Number**

Selects information about the tape drive that has the specified serial number.

**[-ndmp-path <text>, ...] - NDMP Path**

Selects information about the tape drive or drives that have the specified NDMP path.

## Examples

The following example displays information about all tape drives in the cluster:

```
cluster1::> system node hardware tape drive show
Node   Device Id Drive Description      NDMP Path

# system node hardware tape library show

Display information about tape libraries

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the following information about tape libraries:

- Node to which the tape library is attached
- Device ID of the tape library

- Description of the tape library
- NDMP path of the tape library

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape libraries on the specified node.

**[-device-id <text>] - Device ID**

Selects information about the tape library that has the specified device ID.

**[-description <text>] - Description**

Selects information about the tape library or libraries that have the specified description.

**[-wwn <text>] - World Wide Name**

Selects information about the tape library that has the specified worldwide name.

**[-serial-number <text>] - Serial Number**

Selects information about the tape library that has the specified serial number.

**[-ndmp-path <text>] - NDMP Path**

Selects information about the tape library or libraries that have the specified NDMP path.

## Examples

The following example displays information about all tape libraries attached to the cluster:

```
cluster1::> system node hardware tape library show
Node   Device Id Drive Description   NDMP Path
-----
cluster1-00
      0b.125L1 HP      MSL G3      mc1

      0c.125L1 HP      MSL G3      mc0
              Series
2 entries were displayed.
```

# system node hardware unified-connect modify

Modify the Fibre Channel and converged networking adapter configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node hardware unified-connect modify** command changes the adapter configuration. Any changes to the adapter mode or type will require a reboot for the changes to take effect. The adapter must also be offline before you can make any changes.

The adapter argument is in the form *Xy* where *X* is an integer and *y* is a letter. For example: **4a**

For a target adapter, use the [network fcp adapter modify](#) command to bring the adapter offline.

For an initiator adapter, use the **system node run local storage disable adapter** command to take the adapter offline.

The **-mode** parameter refers to the mode of the adapter and can be either **fc** or **cna**.

The **-type** parameter refers to the FC-4 type of the adapter and can be **initiator**, **target**, or **fcvi**.

The **-force** parameter suppresses confirmation prompts.

The adapter type **fcvi** is supported only on platforms with FCVI adapters.

## Parameters

**-node {<nodename>|local} - Node**

Specifies the node of the adapter.

**-adapter <text> - Adapter**

Specifies the adapter.

**[-m, -mode {fc|cna}] - Configured Mode**

Specifies the mode.

**[-t, -type {initiator|target|fcvi}] - Configured Type**

Specifies the FC-4 type.

**[-f, -force <true>] - Force**

Suppresses warnings and confirmation prompts.

## Examples

```
cluster1::> system node hardware unified-connect modify -node node1 -adapter 0d -mode
```

```
cna
```

Configures the mode of adapter 0d on node1 to CNA.

# system node hardware unified-connect show

Displays information about Fibre Channel and converged networking adapters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command manages Fibre Channel and converged networking adapters used by the storage subsystem. Use the command to show the current mode and FC-4 type of adapters or the capabilities of adapters.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-capability ] ]**

If this parameter is specified, the command displays the capabilities of the adapters.

**[ [-instance ] ]**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about Fibre Channel and converged networking adapters on the specified node.

**[-adapter <text>] - Adapter**

If this parameter is specified, the command displays information about the specified adapter.

**[-current-mode {fc|cna}] - Current Mode**

If this parameter is specified, the command displays adapters configured to the specified mode.

**[-current-type {initiator|target|fcvi}] - Current Type**

If this parameter is specified, the command displays adapters configured to the specified FC-4

type.

### **[-pending-mode {fc|cna}] - Pending Mode**

If this parameter is specified, the command displays adapters configured to the specified mode on the next reboot.

### **[-pending-type {initiator|target|fcvi}] - Pending Type**

If this parameter is specified, the command displays adapters configured to the specified FC-4 on the next reboot.

### **[-status-admin <text>] - Administrative Status**

If this parameter is specified, the command displays adapters with the specified status.

### **[-supported-modes {fc|cna}] - Supported Modes**

The list of modes that the adapter supports.

### **[-supported-fc-types {initiator|target|fcvi}] - Supported FC Types**

The list of FC-4 types the adapter supports when configured into fc mode.

### **[-supported-cna-types {initiator|target|fcvi}] - Supported CNA Types**

The list of FC-4 types the adapter supports when configured into cna mode.

## Examples

The following example displays information about all Fibre Channel and converged networking adapters in the cluster:

```
cluster1::> system node hardware unified-connect show
```

Node	Adapter	Current Mode	Current Type	Pending Mode	Pending Type	Admin Status
node1	0c	fc	initiator	-	-	online
node1	0d	fc	initiator	-	-	online
node1	3a	fc	target	-	-	online
node1	3b	fc	target	-	-	online
node1	4a	cna	target	-	-	online
node1	4b	cna	target	-	-	online
node1	6a	fc	target	-	-	online
node1	6b	fc	target	-	-	online
node2	0c	fc	initiator	-	-	online
node2	0d	fc	initiator	-	-	online
node2	3a	fc	target	-	-	online
node2	3b	fc	target	-	-	online
node2	4a	cna	target	-	-	online
node2	4b	cna	target	-	-	online
node2	6a	cna	target	-	-	online
node2	6b	cna	target	-	-	online

16 entries were displayed.

# system node image abort-operation

Abort software image 'update' or 'get' operation

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node image abort-operation** command aborts software installation ("update") or download ("get") operation on the specified node.

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node on which to abort the operation.

## Examples

The following example aborts the software installation operation on a node named **node1**.

```
cluster1::> system node image abort-operation -node node1
```

# system node image get

Fetch a file from a URL

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command fetches a file from the specified URL and stores it in the */mroot/etc/software* directory.

## Parameters

**[-node {<nodename>|local}] - Node**

This parameter specifies the node that fetches and stores the package.

**-package <text> - Package URL**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, HTTPS, FTP and FILE, are accepted. The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The

USB device is specified as **file://usb0/<filename>** . Typically, the file name is **image.tgz** . The package must be present in the root directory of the USB mass storage device. The HTTPS URL scheme requires that you install the HTTPS server certificate on the system by using the command "security certificate install -type server-ca".

#### **[-replace-package <true>] - Replace the Local File**

Specifies whether an existing package is deleted and replaced with a new package. If you enter this command without using this parameter, its effective value is false and an existing package is not replaced with the new one. If you enter this parameter without a value, it is set to true and an existing package is replaced with the new one.

#### **[-rename-package <text>] - Rename the File**

Use this parameter to enter a package name that is different than the file name in the URL.

#### **[-background <true>] - Run in the background**

This parameter allows the operation to run in the background. The progress of the operation can be checked with the command `system image show-update-progress`. If this command is entered without using this parameter, its effective value is false and the operation runs in the foreground. If this parameter is used without a value, it is set to true.

## Examples

```
system image get http://example.com/image.tgz -rename-package image2.tgz -replace -package
```

# system node image modify

Modify software image configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node image modify** command sets the default software image on a specified node. The default software image is the image that is run when the node is started. A node holds two software images; when you set one as the default image, the other image is automatically unset as the default. Conversely, if you unset a software image as the default, the other image is automatically set as the default.

## Parameters

#### **-node {<nodename>|local} - Node**

This specifies the node on which the software image is located.

**-image {image1|image2|remote} - Image Name**

This specifies the software image that is to be set or unset as the default.

**[-isdefault {true|false}] - Is Default Image**

This optionally specifies whether the specified image is the default.

## Examples

The following example sets the software image named image2 as the default image on a node named node0.

```
node::> system node image modify -node node0 -image image2 -isdefault true
Default Image Changed.
```

## system node image show-update-progress

Show progress information for a currently running update

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node image show-update-progress** command displays the progress of a software-image update initiated by using the [system node image update](#) command. The command displays progress until the update completes; you can also interrupt it by pressing Ctrl-C.

## Parameters

**-node {<nodename>|local} - Node**

This optionally specifies the name of a node whose image-update progress is to be displayed.

**[-follow <true>] - Follow the Progress in the Foreground**

Do not use background processing for this command. If you do not use this parameter, the value is **true**.

## Examples

The following example displays image-update progress:

```
node::> system node image show-update-progress

ERROR: command failed: There is no update/install in progress
```

## Related Links

- [system node image update](#)

# system node image show

Display software image information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node image show** command displays information about software images. By default, the command displays the following information:

- Node name
- Image name
- Whether the image is the default image
- Whether the image is the current image
- Software version
- Installation date

To display detailed information about a specific software image, run the command with the `-node` and `-image` parameters. The detailed view adds information about the kernel image path, and the root file system image path.

You can specify additional parameters to select specific information. For example, to display information only about software images that are currently running, run the command with the `-iscurrent true` parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node**

Selects information about the software images on the specified node. If this parameter and the `-image` parameter are both used, the command displays detailed information about the specified software image.

**[-image {image1|image2|remote}] - Image Name**

Selects information about the software images that match the specified name. If this parameter and the `-node` parameter are specified, the command displays detailed information about the specified software image.

**[-isdefault {true|false}] - Is Default Image**

Selects information about the software images with the specified default setting.

**[-iscurrent {true|false}] - Is Current Image**

Selects information about the software images that have the specified currency value.

**[-kernel-path <text>] - Kernel Image Path**

Selects information about the software images that have the specified kernel image path.

**[-rootfs-path <text>] - Root Filesystem Image Path**

Selects information about the software images that have the specified root file system image path.

**[-version <text>] - Software Version**

Selects information about the software images that have the specified root file system image path.

**[-installdate <MM/DD/YYYY HH:MM:SS>] - Install Date**

Selects information about the software image that have the specified installation date. Specify the date in the format MM/DD/YYYY HH:MM:SS [+ HH:MM].

## Examples

The following example displays information about the software images on a node named node1:

```
cluster1::> system node image show -node node1
           Is      Is          Install
Node  Image  Default  Current  Version  Date
-----
node1
      image1 true     true     8.0     8/20/2009 17:42:42
      image2 false    false    8.0     6/26/2009 17:44:50
2 entries were displayed.
```

## system node image update

Perform software image upgrade/downgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node image update** command downloads the software image from a specified location and updates the alternate software image (that is, the image that is not currently running on the node). By default, validation of the software image is not performed. Use the "-validate-only" parameter to validate the software image first, before performing the update on the cluster nodes.

At the advanced privilege level, you can specify whether to disable version-compatibility checking.

## Parameters

### **-node {<nodename>|local}** - Node

This specifies the node on which the software image is located.

### **-package <text>** - Package URL

This specifies the location from which the software image is to be downloaded. The location can be specified in any of the following ways:

- As an HTTP URL in the form **http://host\_name:port/path\_to\_file** . For instance, **http://example.com/downloads/image.tgz** . The management utility prompts you for a user name and password before beginning the download.

If you use HTTP to transfer software images, be aware that the management utility does not check whether the Web server is password protected; if it is not, press Enter at the prompt for user name and password.

- As an HTTPS URL in the form **https://host\_name:port/path\_to\_file** . For instance, **https://example.com/downloads/image.tgz** .

The HTTPS URL scheme requires that you install the HTTPS server certificate on the system by using the command "security certificate install -type server-ca".

- As an FTP URL in the form **ftp://host\_name:port/path\_to\_file** . For instance, **ftp://example.com/downloads/image.tgz** . If required, the management utility prompts you for a user name and password before beginning the download.
- As a filename of a package left behind by a previous installation, or a package fetched using [system node image get](#) . For example, **image.tgz** . Available packages can be displayed using [system node image package show](#) .
- As a path to a package in a mounted file system in the form **file://localhost/path\_to\_file** . For example, **file://localhost/mroot/etc/software/image.tgz** .
- The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as **file://usb0/<filename>** . Typically, the file name is **image.tgz** . The package must be present in the root directory of the USB mass storage device.

### **[-replace {image1|image2}]** - Image to Replace

This optionally specifies the image that is to be replaced when the node is booted from the

network.

### **[-setdefault <true>] - Set Newly Updated Image as Default**

This optionally specifies whether to set the newly updated image as the default image (that is, the image that runs the next time the node is restarted). Note that for this parameter to work correctly, the cluster must be in quorum when the image is updated.

### **[-replace-package <true>] - Replace the Local File**

Specifies whether an existing package is deleted and replaced with a new package. If this command is entered without using this parameter, its effective value is false and an existing package is not replaced with the new one. If this parameter is used without a value, it is set to true and an existing package is replaced with the new one.

### **[-rename-package <text>] - Rename the File**

Use this parameter to enter a package name that is different than the file name in the URL.

### **[-background <true>] - Run in the Background**

This parameter will allow the operation to run in the background. The progress of the operation can be checked with the command [system node image show-update-progress](#) . If this command is entered without using this parameter, its effective value is false and the operation will run in the foreground. If this parameter is used without a value, it is set to true.

### **[-validate-only <true>] - Validate the Package before Installation**

Use this parameter to validate the package. Validation consists of verifying whether there is enough space on the system to install the package, verifying the checksum for each component within the package and so on. Validation usually takes from 30 to 60 minutes. If you specify this parameter, the package will be validated only, not installed.

## Examples

The following example updates the software image on a node named node0 from a software package located at <ftp://ftp.example.com/downloads/image.tgz>:

```
node::> system node image update -node node0 -package
ftp://ftp.example.com/downloads/image.tgz -setdefault true
```

## Related Links

- [system node image package show](#)
- [system node image show-update-progress](#)

# system node image package delete

Delete a software package

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The delete command will delete the specified software package.

## Parameters

**-node {<nodename>|local} - Node**

The package will be deleted from the repository belonging to the node specified with this parameter. The local node is used as the default if this parameter is omitted.

**-package <text> - Package File Name**

This parameter specifies the package to be deleted.

## Examples

```
::> system image package delete image.tgz
1 entry was deleted.
```

# system node image package show

Display software package information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The package show command displays details of the software packages residing on the storage controller.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all

fields.

### **[-node {<nodename>|local}] - Node**

Selects which node's packages are displayed. The local node is the default if this parameter is omitted.

### **[-package <text>] - Package File Name**

This parameter specifies which package's information will be displayed.

## Examples

```
cluster1::> system image package show
  Package
Node Repository Package File Name
-----
node-01
  mroot
                image.tgz
1 entries were displayed.
```

# system node image package external-device delete

Delete file on external device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The delete command deletes the specified file on the external device.

## Parameters

### **-node {<nodename>|local} - Node**

The file is deleted from the external device of the node specified with this parameter. If this parameter is omitted, then the local node is used as the default node.

### **-package <text> - File Name**

This parameter specifies the file to be deleted.

### **-device {usb0|usb1} - Device**

This parameter specifies the name of the external device. Currently, only usb0 is supported. +usb0 refers to the first external USB device connected to the node (regardless of port).

## Examples

```
::> system image package external delete -package image.tgz
```

# system node image package external-device show

Display file listing on external device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The external-device show command displays files residing on the external storage device.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node**

This parameter selects the node that has files that are to be displayed on the external storage device. If this parameter is omitted, then the local node is the default node.

**[ -package <text> ] - File Name**

This parameter specifies the file for which the information is displayed.

**[ -device {usb0|usb1} ] - Device**

This parameter specifies the name of the external device. Currently, only usb0 is supported. + usb0 refers to the first external USB device connected to the node (regardless of port).

## Examples

```
cluster1::> system image package external-device show
Node           Device           Package File Name
-----
node-01        usb0             image.tgz
node-01        usb0             netboot.tgz
```

2 entries were displayed.

# system node internal-switch show

Display onboard switch attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node internal-switch show** command is used to display the internal switch state information and the link status.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to specify the node the switch resides on.

**[-switch-id <integer>] - Switch**

Use this parameter to specify the switch id. For example, 1.

**[-port-id <integer>] - Port**

Use this parameter to specify the port id. For example, 0.

**[-port-name <text>] - Port Name**

Use this parameter to specify the port name. For example, e0M.

**[-auto-admin <Auto-negotiation setting>] - Auto-Negotiation Administrative**

Use this parameter to show the auto-negotiation administrative setting. 'enable' or 'disable'.

**[-auto-op <Auto-negotiation setting>] - Auto-Negotiation Operational**

Use this parameter to show the auto-negotiation operational setting. 'unknown', 'complete', 'incomplete', 'failed' or 'disabled'.

**[-duplex-admin <Duplex>] - Duplex Mode Administrative**

Use this parameter to show the duplex mode administrative setting. 'half' or 'full'.

**[-duplex-op <Duplex>] - Duplex Mode Operational**

Use this parameter to show the duplex mode operational setting. 'half' or 'full'.

**[-speed-admin <Link speed>] - Speed Administrative**

Use this parameter to show the speed administrative setting. '10', '100' or '1000'.

**[-speed-op <Link speed>] - Speed Operational**

Use this parameter to show the speed operational setting. '10', '100' or '1000'.

**[-link <Link Status>] - Link State**

Use this parameter to show the link state, 'up' or 'down'.

**[-up-admin <Link Status>] - Up Administrative**

Use this parameter to show the up administrative setting, 'up' or 'down'.

**[-fc-op <Flow control>] - Flow Control Operational**

Use this parameter to show the flow control operational setting, 'full', 'send', 'receive' or 'none'.

## Examples

The example shows the attributes of the internal switch 0 on the node Node1.

```
cluster1::> system node internal-switch show -node Node1 -switch-id 0
Port Role          Link  Auto-Negot          Duplex          Speed(Mbps)
Admin/Oper        Admin/Oper        Admin/Oper
-----
Node: Node1      , Switch: 0
0  sw-wrench        up    enable/complete    full/full      1000/1000
1  sw-locked-wrench down  enable/incomplete  full/half      100/10
2  sw-e0M           up    enable/complete    full/full      1000/1000
3  sw-e0P           down  enable/incomplete  full/half      100/10
4  sw-midplane-1   down  enable/incomplete  full/half      100/10
5  sw-expander-1   up    enable/unknown     full/full      100/100
6  sw-sp-1         up    enable/unknown     full/full      100/100
7 entries were displayed.
```

## system node internal-switch dump stat

Display onboard switch port statistics counter

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system node internal-switch dump stat** command is used to display the counter information of the internal switch ports.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node <nodename> ] - Node**

Use this parameter to specify the node the switch resides on.

**[ -switch-id <integer> ] - Switch**

Use this parameter to specify the switch id. For example, 1.

**[ -port-id <integer> ] - Port**

Use this parameter to specify the port id. For example, 0.

**[ -stat-id <text> ] - Counter Name**

Use this parameter to specify the counter name.

**[ -valued <integer> ] - Counter Value**

Use this parameter to show the value of specified counter.

**[ -port-name <text> ] - Port Name**

Use this parameter to specify the port name. For example, e0M.

## Examples

The following example shows partial counter information of the internal switch 0 on Node1

```
cluster1::> system node internal-switch dump stat -node Node1 -switch-id 0
Port  Port Name          Counter              Value
----  -
Node: Node1          , Switch: 0
0     sw-wrench           1024ToMax0ctets     22480201
0     sw-wrench           128To2550ctets      119552
0     sw-wrench           256To5110ctets      345587
0     sw-wrench           512To10230ctets     1250437
0     sw-wrench           640ctets             803025
```

## system node nfs usage show

Show NFS usage in the local node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The ``system node nfs usage show`` command displays the NFS usage information in the local node. The display output shows the number of RPC calls received per protocol on the local node. Usage is collected whenever there is any NFS traffic. These values are not persistent and will reset when the node reboots.

## Examples

The following example displays the NFS usage information that does not have any NFS usage.

```
::*> system node nfs usage show
Node: node1
v3: 0
v4: 0
```

The following example displays the NFS usage information with v3 usage.

```
::*> system node nfs usage show
Node: node1
v3: 5
v4: 0
```

The following example displays the NFS usage information with v4 usage.

```
::*> system node nfs usage show
Node: node1
v3: 0
v4: 14
```

## system node power on

Power nodes on

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command switches on the power of the main controller of the specified node. This command works for a single node only and the full name of the node must be entered exactly.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node whose power you want to switch on.

## Examples

The following example switches on the power of node2.

```
cluster1::> set advanced
```

```
Warning: These advanced commands are potentially dangerous; use them only when  
directed to do so by Fujitsu personnel.
```

```
Do you want to continue? {y|n}: y
```

```
cluster1::*>
```

```
cluster1::*> system node power on -node node2
```

```
cluster1::*>
```

## system node power show

Display the current power status of the nodes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the power status of the main controller in each node across the cluster.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This optional parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

## [-status {on|off}] - Current Power Status

If the `-status` parameter is specified, the command only lists information about the node with the power status value you enter.

## Examples

The following example displays power status of all the nodes in cluster1.

```
cluster1::> system node power show
```

```
Node           Status
-----
node1          on
node2          on
2 entries were displayed.
```

```
cluster1::>
```

## system node root-mount create

Create a mount from one node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node root-mount create` command produces a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate creation by a background task. Use the `system node root-mount show` command to view the current status of root-mount or verify task completion.

## Parameters

### `-node <nodename>` - Owner of the Root-mount

The node name where the root-mount will be created.

### `-root-node <nodename>` - Root-mount Destination Node

The node name that the root-mount will access.

## Examples

The following example shows the creation of a root-mount from `cluster1::nodeA` to `cluster1::nodeB` and the verification of the successful completion.

```
cluster1::> system node root-mount show
This table is currently empty.

cluster1::> system node root-mount create -node nodeA -root-node nodeB

cluster1::> system node root-mount show
Node           Root Node      State      Last Error
-----
nodeA          nodeB          ready
```

## Related Links

- [system node root-mount show](#)

# system node root-mount delete

Delete a mount from one node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node root-mount delete** command removes a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate deletion by a background task. Use the [system node root-mount show](#) command to view the current status of root-mount or verify task completion.

## Parameters

**-node <nodename> - Owner of the Root-mount**

The node which has the mount.

**-root-node <nodename> - Root-mount Destination Node**

The node accessed by the mount.

## Examples

This example shows the deletion of a root-mount from **cluster1::nodeA** to **cluster1::nodeB** and the verification of the command's successful completion.

```
cluster1::> system node root-mount show
Node           Root Node      State      Last Error
-----
nodeA          NodeB          ready
```

```
cluster1::> system node root-mount delete -node nodeA -root-node nodeB

cluster1::> system node root-mount show
This table is currently empty.
```

## Related Links

- [system node root-mount show](#)

# system node root-mount show

Show the existing mounts from any node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node root-mount show** command displays the status of current root-mounts from any node to another node's root volume. These root-mounts are used by cluster services to access data on other nodes in the cluster. These root-mounts are not pre-created, but are created as they are needed. They can also be manually created or deleted.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node <nodename> ] - Owner of the Root-mount**

Selects information about root-mounts that exist on the specified node.

**[ -root-node <nodename> ] - Root-mount Destination Node**

Selects information about root-mounts that connect to the specified node.

**[ -create-time <MM/DD/YYYY HH:MM:SS> ] - Mount Creation Time**

Selects information about root-mounts that were created at the specified time.

**[ -state <Mount State> ] - State of the Root-Mount**

Selects information about root-mounts that have the specified state. The states are:

- **unknown** : The state of the root-mount is being determined.

- **initializing** : A root-mount was found and needs testing to determine the correct state.
- **mount-requested** : The root-mount has been requested, but is not ready.
- **mounting** : The root-mount is being created, but is not ready.
- **ready** : The root-mount is ready to be used.
- **not-responding** : The root-mount exists but is not responding.
- **does-not-exist** : No root-mount is possible to this node's root volume.
- **ha-busy** : The root-mount is busy pending completion of an HA event.
- **clean-up-requested** : The root-mount is being deleted.
- **cleaning-up** : The root-mount is being deleted.
- **create-error** : The root-mount could not be created.

### **[-last-error <text>] - Last Error**

Selects information about root-mounts that have the specified last-error value.

## Examples

+ The following example shows the default state of the root-mounts on a cluster that is not using root-node services:

```
cluster1::> system node root-mount show
This table is currently empty.
```

+ The following example displays the root-mounts that exist for a cluster that has ``\_nodeA\_`` mounted to ``\_nodeB\_`` , and ``\_nodeB\_`` mounted to ``\_nodeA\_`` :

```
cluster1::> system node root-mount show
Node           Root Node      State      Last Error
-----
nodeA          nodeB          ready
nodeB          nodeA          ready
2 entries were displayed.
```

## system node upgrade-revert show

Display upgrade/revert node status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node upgrade-revert show** command displays information about the status of upgrades or reversions. If an upgrade has failed, this command enables you to determine which phase of the upgrade contains the failed upgrade task and the reason for the failure.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display status information only about upgrades or reversions that are slated to occur on the nodes you specify.

**[-upgrade-version <integer>] - Cluster Upgrade Version**

Selects status information about upgrades or reversions that are to the version number you specify.

**[-startup-phase {pre-root|pre-apps|post-apps}] - Startup Phase**

Selects status information about upgrades or reversions that are slated to occur during the startup phase you specify. Startup phases are:

- pre-root - Upgrade is applied before mroot is mounted
- pre-apps - Upgrade is applied before other cluster apps are started
- post-apps - Upgrade is applied after all RDB apps are online

**[-status <Upgrade/Revert Execution Status>] - Execution Status**

Selects status information about upgrades or reversions that have the execution status you specify. Execution statuses are:

- prepared - Ready to upgrade
- applied - Successful upgrade
- reverted - Successful reversion
- failed - Unsuccessful upgrade or reversion
- aborted - Unsuccessful upgrade or reversion
- skipped - Upgrade or reversion was skipped for that phase
- locked - Upgrading or reverting

**[-status-msg <text>] - Status Message**

Selects status information about upgrades or reversions that have the status message you specify. The status message displays the current status of the phase with which it appears.

**[-direction {upgrade|revert}] - Upgrade/Revert Direction**

Use this parameter with the value **upgrade** to select status information about upgrades. Use this parameter with the value **revert** to select status information about reversions.

**[-node-status {reverting|complete|not-needed|aborted|failed|waiting|in-progress|stopped}] - Node Status**

Selects status information about upgrades or reversions that have the status you specify on nodes where they are slated to occur. Node statuses are:

- aborted - Upgrade process aborted. Contact support personnel.
- failed - Upgrade process failed. Contact support personnel.
- stopped - Upgrade process stopped due to node or management application restart. Use the [system node upgrade-revert upgrade](#) command to complete the upgrade manually.
- complete - Upgrade process completed successfully.
- waiting - Upgrade process is waiting the replication database to come online or for applications to be stable. If the RDB is not online, check network connectivity using [cluster show](#) and [cluster ping-cluster](#) to ensure that all nodes are healthy and in communication.

**[-node-status-msg <text>] - Node Status Message**

Selects status information about upgrades or reversions that have the node status message you specify. The node status message displays the upgrade or reversion status of the node with which it appears. If the upgrade or reversion fails, this message provides information that helps to diagnose the cause of the failure.

## Examples

The following example shows typical output for a cluster with two nodes. Status messages for each phase display information about the tasks in that phase.

```
cluster1::*> system node upgrade-revert show

Node: node1                               Status: complete

Status Message: The upgrade is complete.
Vers Phase      Status  Upgrade Phase Status Message
-----
200 pre-root    applied No upgrade is required for this phase.
200 pre-apps    applied Upgrade successful.
200 post-apps   applied Upgrade successful.

Node: node2                               Status: complete
```

Status Message: The upgrade is complete.

Vers	Phase	Status	Upgrade Phase	Status Message
200	pre-root	applied	No upgrade is required for this phase.	
200	pre-apps	applied	Upgrade successful.	
200	post-apps	applied	Upgrade successful.	
6 entries were displayed.				

## Related Links

- [system node upgrade-revert upgrade](#)
- [cluster show](#)
- [cluster ping-cluster](#)

# system node upgrade-revert upgrade

Run the upgrade at a specific phase.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node upgrade-revert upgrade** command manually executes an upgrade. Use this command to execute an upgrade after issues that caused an upgrade failure are resolved. If the upgrade is successful, no messages display.

Before the command executes upgrades, it checks the configuration of the nodes in the cluster. If no upgrades are needed, the command displays a message and does not execute any upgrades.

## Parameters

**-node {<nodename>|local} - Node**

Specifies the node that is to be upgraded. The value **local** specifies the current node.

## Examples

This example shows command output of a node named **node0** if node configuration is current.

```
cluster1::*> system node upgrade-revert upgrade -node node0
The node configuration is up-to-date. No upgrade is needed.
```

# system node usb-ports modify

Modify the state of the external USB ports on the next boot

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node usb-ports modify** command allows the user to change the state of the external USB ports on the next boot.

## Parameters

**-node {<nodename>|local}** - Node That Owns the External USB Ports

This parameter specifies which node the external USB state will be modified.

**[-is-disabled-next-boot {true|false}]** - State of the External USB Ports on the Next Boot

If set to `true` the external USB ports on the specified node will be disabled on the next boot.

## Examples

The following example disables the external USB ports for node1 on the next boot:

```
cluster1::> system node usb-ports modify -node node1 -is-disabled-next-boot true
ALERT: A reboot is required for changes to take effect.
```

# system node usb-ports show

Display the state of the external USB ports

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node usb-ports show** command displays the status of the external USB ports on each node.

## Parameters

**{[-fields <fieldname>,...]}**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[`-instance`] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node That Owns the External USB Ports**

If this parameter is specified, the command displays information about the status of the external USB ports on the specified node.

**[`-is-disabled {true|false}`] - Current State of the External USB Ports**

This parameter specifies the current state of the external USB ports.

**[`-is-disabled-next-boot {true|false}`] - State of the External USB Ports on the Next Boot**

This parameter specifies the state of the external USB ports after the next boot.

**[`-is-feature-supported {true|false}`] - External USB Ports Supported?**

This parameter specifies whether or not the node even supports external USB ports.

**[`-connected-ports {true|false}`] - Connected USB Devices**

This parameter specifies whether or not the USB ports have a device connected to them.

## Examples

The following example displays information about the state of the external USB ports:

```
cluster1::> system node usb-ports show
Node           Disabled?           Disabled on Next Boot?  Supported?
Devices Connected to Ports
-----
node1          false              true                    true       false
```

# system node virtual-machine show-network-load-balancer

Display network load balancer information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node virtual-machine show-network-load-balancer` displays the list of network load balancer probe ports for each ONTAP node in the cluster.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node**

Represents the name of the ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-vserver-name <text>] - Vserver Name**

Vserver name.

**[-lif-name <text>] - ONTAP LIF Name**

ONTAP logical interface name.

**[-probe-port <integer>] - Probe Port**

A TCP port which is regularly probed by the network load balancer. When the TCP port is healthy and open, the network load balancer will continue sending traffic to an associated network route. When unhealthy, the network load balancer will redirect all traffic intended for this route to an alternate route.

**[-last-probe-time <MM/DD/YYYY HH:MM:SS>] - Last Probe Time**

The timestamp of the most recent health probe request on this TCP port.

**[-remove-listener {true|false}] - Remove listener for This LIF**

Whether or not ONTAP has programmatically told the network load balancer to stop listening on the health probe associated with this LIF.

**[-active {true|false}] - Actively receiving Health Probes**

Whether or not the network load balancer has received a health probe request on this TCP port, within the expected timeframe.

## Examples

The following example displays probe ports for each node in the cluster.

```
cluster1::*> system node virtual-machine show-network-load-balancer
```

Node	Vserver	Logical Interface	Probe Port	Last Probe Time
node1	vserver0	data_lif1	63002	5/8/2018 19:22:47
	cluster1	cluster_mgmt	63001	5/8/2018 19:22:43

node2	vserver0	data_lif2	63003	5/8/2018 19:22:44
	vserver0	svm_mgmt	63004	5/8/2018 19:22:50

4 entries were displayed.

# system node virtual-machine disk-object-store create

Define the configuration for an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node virtual-machine disk-object-store create` command adds an object store container to a node's configuration. All objects within the container will be added as disks to the specified node.

## Parameters

**-node <nodename> - ONTAP Node Name**

Specifies the name of the ONTAP node to which the object store container will be added.

**-object-store-name <object store name> - ONTAP Name for this Object Store Config**

Specifies the name that will be used to identify the object store configuration.

**-server <text> - Fully Qualified Domain Name of the Object Store Server**

Specifies the object store server where the container is hosted.

**-port <integer> - Port Number of the Object Store**

Specifies the port number to connect to the object store server.

**-container-name <text> - Container Name**

Specifies the name of the container to be added.

**-azure-account <text> - Azure Storage Account**

Specifies the Azure storage account.

**-azure-private-key <text> - Azure Storage Account Access Key**

Specifies the access key required to authenticate requests to the Azure object store.

**[-update-partner <>true>] - Update HA Partner**

Specify this parameter when the system is running in an HA configuration.

## Examples

The following example adds a container to the specified node.

```
cluster1::*> system node virtual-machine disk-object-store create
               -node node1 -object-store-name objstore1 -server
storageaccount1.blob.core.windows.net
               -container-name container1 -azure-account storageaccount1
               -azure-private-key
XpSUcS/f1s14sHfDuzYeyU3Yz9dNqVEsxDv48/P8Zk8j0uDoWYnsf/8JBh1HImH/RP9IO6maKLYqEXAMPLEKEY
               == -update-partner
```

# system node virtual-machine disk-object-store delete

Delete the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node virtual-machine disk-object-store delete` command removes an object store container from a node's configuration.

## Parameters

**-node <nodename> - ONTAP Node Name**

Specifies the name of the ONTAP node from which the object store container will be removed.

**-object-store-name <object store name> - ONTAP Name for this Object Store Config**

Specifies the name that will be used to identify the object store configuration.

**[-update-partner {true|false}] - Update HA Partner**

Specify this parameter when the system is running in an HA configuration.

## Examples

The following example removes a container from the specified node.

```
cluster1::*> system node virtual-machine disk-object-store delete
               -node node1 -object-store-name objstore1 -update-partner
```

# system node virtual-machine disk-object-store modify

Modify the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node virtual-machine disk-object-store modify** command updates one or more object store configuration parameters.

## Parameters

**-node <nodename> - ONTAP Node Name**

Specifies the name of the ONTAP node for which the object store configuration will be modified.

**-object-store-name <object store name> - ONTAP Name for this Object Store Config**

Specifies the name that will be used to identify the object store configuration.

**[-server <text>] - Fully Qualified Domain Name of the Object Store Server**

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server.

**[-azure-private-key <text>] - Azure Storage Account Access Key**

This optional parameter specifies a new access key for the storage account.

**[-update-partner <>true>] - Update HA Partner**

Specify this parameter when the system is running in an HA configuration.

## Examples

The following example updates the stored private key for an Azure container on the specified node.

```
cluster1::*> system node virtual-machine disk-object-store modify
                -node node1 -object-store-name objstore1
                -azure-private-key
XpSUcS/f1s14sHfDuzYeyU3Yz9dNqVEsxDv48/P8Zk8j0uDoWYnsf/8JBh1HImH/RP9IO6maKLYqEXAMPLEKEY
== -update-partner
```

# system node virtual-machine disk-object-store show

Display the list of object store configurations

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system node virtual-machine disk-object-store show** command displays the list of object store containers that contain each node's disks.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node <nodename>] - ONTAP Node Name**

Represents the name of the ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-object-store-name <object store name>] - ONTAP Name for this Object Store Config**

Selects object store configurations with the specified name.

**[-server <text>] - Fully Qualified Domain Name of the Object Store Server**

Selects containers on the specified server.

**[-port <integer>] - Port Number of the Object Store**

Selects containers attached on the specified port.

**[-container-name <text>] - Container Name**

Selects containers with the specified name.

**[-azure-account <text>] - Azure Storage Account**

Selects containers in the specified Azure storage account.

**[-alive {true|false}] - Is Server Alive**

Selects containers based on their aliveness state, as seen from the ONTAP node.

## Examples

The following example displays the list of containers for each node in the cluster.

```
cluster1::*> system node virtual-machine disk-object-store show
      Object Store
Node      Name      Azure Storage Account  Container Name  Alive
-----
node1     objstore1  storageaccount1        container1      true
node2     objstore1  storageaccount1        container1      true
2 entries were displayed.
```

## system node virtual-machine hypervisor show

Display hypervisor information about Data ONTAP-v nodes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node virtual-machine hypervisor show` command displays information for each hypervisor that is hosting a Data ONTAP virtual machine. The output contains the hypervisor-specific information, such as host name and IP address, as well as network configuration details. The command only scans hypervisors on which Data ONTAP virtual machines are installed. To filter command output, specify any number of optional fields listed below.

### Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

`[-vm-uuid <UUID>] - UUID of the Virtual Machine`

The hypervisor-supplied unique ID for this virtual machine. This optional parameter selects

information about the hypervisor on which the Data ONTAP virtual machine is running with the specified UUID. Since UUID is unique per host, an alternative and easier way is to use **-node** to filter out the same information.

**[-vmhost-bios-release-date <text>] - Release Date for the Hypervisor BIOS**

The release date for the currently running hypervisor BIOS. This optional parameter selects information about the hypervisors that have the specified BIOS release date.

**[-vmhost-bios-version <text>] - Current BIOS Version of the Hypervisor Physical Chassis**

The current BIOS version of the hypervisor physical chassis. This optional parameter selects information about the hypervisors that are running with the specified BIOS version.

**[-vmhost-boot-time <text>] - Time When Hypervisor was Last Booted**

The time when the hypervisor was last booted. This optional parameter selects information about the hypervisors which were last booted at the specified boot time.

**[-vmhost-cpu-clock-rate <integer>] - Speed of the Hypervisor CPU Cores (MHz)**

The speed of the hypervisor CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU clock rate.

**[-vmhost-cpu-core-count <integer>] - Number of Physical CPU Cores on the Hypervisor**

The number of physical CPU cores on the hypervisor. Physical CPU cores are the processors contained by a CPU package. This optional parameter selects information about the hypervisors that are running with the specified CPU cores.

**[-vmhost-cpu-socket-count <integer>] - Number of Physical CPU Packages on the Hypervisor**

The number of physical CPU packages on the hypervisor. Physical CPU packages are chips that contain one or more processors. Processors contained by a package are also known as CPU cores. For example, one dual-core package is comprised of one chip that contains two CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU sockets.

**[-vmhost-cpu-thread-count <integer>] - Number of Physical CPU Threads on the Hypervisor**

The number of physical CPU threads on the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified CPU threads.

**[-vmhost-gateway <text>] - Default Gateway for the Hypervisor**

The default gateway for the hypervisor. This optional parameter selects information about the hypervisors with the specified gateway address.

**[-vmhost-hardware-vendor <text>] - Hardware Vendor of the Hypervisor**

The name of hypervisor hardware manufacturer. This optional parameter selects information about the hypervisors with the specified hardware vendor.

**[-vmhost-hypervisor <text>] - Complete Product Name, including the Version Information for the Hypervisor**

The complete product name, including the version information for the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified

hypervisor version.

**[-vmhost-ip-address <text>] - Primary IP Address Assigned to the Hypervisor**

The primary IP address assigned to the hypervisor. This optional parameter selects information about the hypervisors with the specified IP address.

**[-vmhost-memory <integer>] - Physical Memory Size of the Hypervisor (Bytes)**

The physical memory size of the hypervisor in bytes. This optional parameter selects information about the hypervisors that are running with the specified physical memory.

**[-vmhost-model <text>] - Hypervisor Manufacturer-Supplied Hardware Model Name**

The hypervisor manufacturer-supplied hardware model name. This optional parameter selects information about the hypervisors with the specified hardware model.

**[-vmhost-name <text>] - Hostname of the Hypervisor**

The host name assigned to the hypervisor. This optional parameter selects information about the hypervisor with the specified host name.

**[-vmhost-netmask <text>] - Subnet Mask Address for the Hypervisor**

The subnet mask address for the hypervisor. This optional parameter selects information about the hypervisors with the specified netmask address.

**[-vmhost-processor-id <text>] - Processor ID of the Hypervisor**

The processor ID of the hypervisor. This optional parameter selects information about the hypervisors with the specified processor ID.

**[-vmhost-processor-type <text>] - CPU Model of the Hypervisor**

The CPU model of the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified processor type.

**[-vmhost-software-vendor <text>] - Name of the Virtual Machine Software Manufacturer**

The name of the virtual machine software manufacturer. This optional parameter selects information about the hypervisors with the specified software vendor.

**[-vmhost-uuid <UUID>] - UUID of the Hypervisor**

A unique ID for the hypervisor. This optional parameter selects information about the hypervisor with the specified UUID.

**[-vmhost-error <text>] - Error in case Hypervisor Info Retrieval Fails**

Displays a list of nodes on which the hypervisor has received the specified error. This parameter is most useful when entered with wildcards.

**[-vm-custom-max-capacity <integer>] - Maximum Storage Capacity of the Virtual Machine (in TB)**

The maximum system capacity (in TB) that can be configured on the VM. This optional parameter selects information about the node's storage capacity.

## Examples

The following example shows typical output from the **system node virtual-machine hypervisor show** command for the Data ONTAP virtual machines running in the cluster.

```
cluster1::> system node virtual-machine hypervisor show

# system node virtual-machine instance show-system-disks

Display information about virtual machine system disks

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node virtual-machine instance show-system-disks` command displays information about the system disks (non-data disks) attached to the virtual machine. Data disk information is available using the command `storage disk show`-virtual-machine-disk-info``.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node Name`

Selects disk information for nodes that match this parameter.

`[-vmdisk-purpose <text>] - Purpose of the System Disk`

Selects disk information for disks that match this parameter. Values include: **Boot**, **NVRAM**, and **Core**.

`[-vmdisk-type <text>] - Type of the System Disk`

Selects disk information for disks that match this parameter. Possible values are: **VMDISK**, **SSD**.

`[-vmdisk-name <text>] - System Disk Name`

Selects disk information for disks that match this parameter. The virtual machine ID of the system disk.

`[-vmdisk-capacity <text>] - Size of the System Disk (GB)`

Selects disk information for disks that match this parameter. The size of the system disk.

`[-vmdisk-file-name <text>] - File Name of the System Disk Used By the Hypervisor`

Selects disk information for disks that match this parameter. The virtual machine file name of the disk. Each system disk is mapped to a unique VM disk file.

## Examples

The following example shows typical output from the command.

```
cluster1::> system node virtual-machine instance show-system-disks
  Disk   Disk   Disk   Disk
Node Purpose Type   Name Capacity GB VM Disk File Name
-----
node1
  boot   SSD    da0      10 node1-vm-disk-boot
  nvram  SSD    da1     500 node1-vm-disk-nvram
  core   VMDISK da2     216 node1-vm-disk-core
```

# system node virtual-machine instance show

Display virtual machine instance information per node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system node virtual-machine instance show** command displays virtual machine information. With this information you can determine the relationship between a Data ONTAP **node** and its associated virtual machine instance running within a cloud provider. Several other details about the virtual machine can be extracted as well, such as the cloud provider account ID to which it belongs. To filter command output, specify any number of optional fields listed below.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This optional parameter represents the name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-instance-id <text>] - ID of This Instance**

Selects the nodes that match this parameter value. A cloud provider-supplied unique instance ID for this virtual machine, for example "i-a9d42f89" or "db00a7755a5e4e8a8fe4b19bc3b330c3.1".

**[-account-id <text>] - ID of This Account**

Selects the nodes that match this parameter value. The cloud provider-associated account ID for this virtual machine. This parameter is usually associated with a cloud provider login ID and password.

**[-image-id <text>] - ID Of the Image in Use on This Instance**

Selects the nodes that match this parameter value. The image ID installed on this virtual machine instance. It identifies a pre-defined template of a computing device's software environment. It contains the operating system and can also include application software, such as database servers, middleware, and web servers. In this case, the ID refers to an image that contains everything required to run Data ONTAP in the cloud.

**[-instance-type <text>] - Specifies System Attributes and Use Cost**

Selects the nodes that match this parameter value. A specification (as defined by the cloud provider) that defines the memory, CPU, storage capacity and usage cost for a virtual machine instance. Some instance types are designed for standard applications, whereas others are designed for CPU-intensive or memory-intensive applications and so on.

**[-region <text>] - Set of Resources in the Same Geographic Area**

Selects the nodes that match this parameter value. A named set of resources in the same geographical area. For example "us-east-1" might be the name for a collection of compute and storage resources on the eastern coast of the United States. Typically, a region contains multiple availability zones.

**[-version <text>] - Instance Metadata Version of This VM**

Selects the nodes that match this parameter value. The instance metadata version of this virtual machine instance.

**[-availability-zone <text>] - Distinct Location within a Region**

Selects the nodes that match this parameter value. A distinct location within a **region** that is insulated from failures in other availability zones. It provides low-latency network connectivity to other availability zones in the same region.

**[-primary-ip <text>] - Primary IP Address Assigned to this Instance**

Selects the nodes that match this parameter value. The primary IP address assigned to this virtual machine instance.

**[-fault-domain <integer>] - Fault Domain of This Instance**

Selects the nodes that match this parameter value. A cloud provider-assigned numerical fault domain ID for this virtual machine within an Availability Set.

**[-update-domain <integer>] - Update Domain of This Instance**

Selects the nodes that match this parameter value. A cloud provider-assigned numerical update

domain ID for this virtual machine within an Availability Set.

**[-provider <text>] - Provider on which this instance is running.**

Selects the nodes that match this parameter value. The provider on which this instance is running.

**[-offer <text>] - Marketplace Offer for This Image**

Selects the nodes that match this parameter value. A Marketplace is an online store that offers applications and services either built on or designed to integrate with a particular cloud provider. A virtual machine offer corresponds to a class of product offering from a publisher. An offer is a collection of SKUs. Every offer appears as its own entity in the provider Marketplace.

**[-sku <text>] - Marketplace SKU for This Image**

Selects the nodes that match this parameter value. A SKU is the smallest purchasable unit of an offer. While within the same product class (offer), SKUs allow you to differentiate between different features supported, VM image types and billing models supported.

**[-sku-version <text>] - Marketplace Version of a SKU**

Selects the nodes that match this parameter value. The version for this virtual machine SKU.

**[-resource-group-name <text>] - Resource Group Name of This Instance**

Selects the nodes that match this parameter value. Resource group for the instance.

**[-cpu-platform <text>] - CPU Platform of the Instance**

Selects the nodes that match this parameter value. GCP only. CPU platform of the hypervisor host. Example: **Intel Broadwell** .

**[-consumer <text>] - Consumer of this Instance**

Selects the nodes that match this parameter value. Consumer is based on the platform/infrastructure on which ONTAP is launched. Example: **Marketplace** .

## Examples

The following examples illustrate typical output from the **system node virtual-machine instance show** command for a virtual machine running in a cloud provider environment.

```
cluster1::> system node virtual-machine instance show
      Node: node1
      Instance ID: i-b9c42e97
      Account ID: 751083215869
      Image ID: ami-7fb4a1c6
      Instance Type: m3.xlarge
      Region: us-east-1
      Metadata Version: 2010-08-31
      Availability Zone: us-east-1d
      Primary IP: 192.168.0.1
      Provider: AWS
      Consumer: Marketplace
      Storage Type: SSD
```

```
IOPS/GB: 5
Storage Capacity (GB): 1024
Throughput Capacity (MBps): 1000

```

## system script delete

Delete saved CLI session logs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system script delete** command deletes files that contain CLI session records. Use the [system script show](#) command to display saved CLI sessions.

### Parameters

**-username <text> - Log Owner Username**

Use this parameter to specify the name of the user whose CLI session record files are deleted. The default is the username is that of the logged in user.

## **-filename <text> - Log Filename**

Use this parameter to specify the names of CLI session record files to delete.

## Examples

The following example shows how to delete the files named **sessionlog2** and **sessionlog3**.

```
cluster1::> system script delete -filename sessionlog2,sessionlog3
```

The following example deletes all saved script files.

```
cluster1::> system script delete *
```

# system script show

Display saved CLI session logs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system script show** command displays information about files that contain records of CLI sessions.

For security reasons, the command normally displays only the script files created by the logged in user. Administrative users can display all log files using the **-user** parameter.

## Parameters

**{ [-fields <fieldname>, ... ]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-user ]**

Use this parameter to display all script files created by all users, along with the username associated with each file.

**[ [-instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all

fields.

#### **[-username <text>] - Log Owner Username**

Use this parameter to display information only about files saved by the user you specify. The default username is that of the logged in user.

#### **[-filename <text>] - Log Filename**

Use this parameter to display information only about files that have the file name you specify.

#### **[-size-limit {<integer>[KB|MB|GB|TB|PB]}] - Logfile Size Limit**

Use this parameter to display information only about files that have the size limit you specify.

#### **[-state <State of CLI session log>] - Current State**

Use this parameter to display information only about files that have the state you specify. Valid values for this parameter are **open-and-logging**, **file-full**, and **file-closed**.

#### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Current Logfile Size**

Use this parameter to display information only about files that are the size you specify.

#### **[-mtime <MM/DD/YYYY HH:MM:SS>] - Last Modification Time**

Use this parameter to display information only about files that were last modified at the date and time you specify.

#### **[-this-session {yes|no}] - Session is Logging**

Use this parameter with the value **yes** to display information only about files that are recording the current CLI session. Use this parameter with the value **no** to display information only about files that are not recording the current CLI session.

## Examples

The following example displays typical system script information.

```
cluster1::> system script show
          This
FileName  Sess State           Size  Last Mod Date
-----
sessionlog1  no  file-closed      435B  12/2/2008 10:51:12
sessionlog2  yes  open-and-logging 193B  12/2/2008 10:51:29
2 entries were displayed.
```

## system script start

Start logging all CLI I/O to session log

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system script start** command starts creating a record of your CLI session. The record is stored in a file. Use the [system script show -this-sessionyes](#) command to display files that are recording the current CLI session. Use the [system script stop](#) command to stop recording the current CLI session.

## Parameters

### **-filename <text> - Filename to Log To**

Use this parameter to specify the file name to which the CLI session record is saved.

### **-size-limit {<integer>[KB|MB|GB|TB|PB]} - Logfile Size Limit Max:2GB**

Use this parameter to specify the maximum size of the file that contains the CLI session record. When the file size reaches this limit, recording stops. The default file size limit is **1 MB** . The maximum file size limit is **2 GB** .

## Examples

The following example shows how to start creating a record of the CLI session in a file named **sessionlog3** . The size limit of this file is **20 MB** .

```
cluster1::> system script start -filename sessionlog3 -size-limit 20MB
```

## Related Links

- [system script show](#)
- [system script stop](#)

# system script stop

Stops logging CLI I/O

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system script stop** command stops creating a record of your CLI session, if you started creating the record by using the [system script start](#) command. Use the [system script show -this-sessionyes](#) command to display files that are recording the current CLI session.

## Examples

The following example shows how to stop creating a record of your CLI session.

```
cluster1::> system script stop
```

## Related Links

- [system script start](#)
- [system script show](#)

# system script upload

Upload the selected CLI session log

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system script upload** command uploads a CLI session record file to a remote location. Specify the remote location using an FTP or HTTP URI. Use the [system script show](#) command to display saved CLI sessions. Use the [system script start](#) command to record a CLI session and save it to a file.

## Parameters

**-username <text> - Username If Not Your Own**

Use this parameter to specify the name of the user who owns the file to upload. By default, this is the user who is logged in.

**-filename <text> - Filename to Log To**

Use this parameter to specify the name of a file to be uploaded.

**-destination {(ftp|http|https)://(hostname|IPv4 Address|['IPv6 Address'])...} - URI to Send File To**

Use this parameter to specify the FTP or HTTP destination of the file.

## Examples

The following example shows how to upload the file named **sessionlog3** to the destination [ftp://now.example.com/cli\\_sessions](ftp://now.example.com/cli_sessions).

```
cluster1::> system script upload -filename sessionlog3 -destination  
ftp://now.example.com/cli_sessions
```

# system service-processor reboot-sp

Reboot the Service Processor on a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor reboot-sp` command reboots the Service Processor of the specified node.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node whose Service Processor is to be rebooted.

**[-image {primary|backup}] - Image to Boot with After Reboot**

This parameter specifies the image that the Service Processor uses after the reboot. By default, the **primary** image is used. Avoid booting the SP from the backup image. Booting from the backup image is reserved for troubleshooting and recovery purposes only. It might require that the SP automatic firmware update be disabled, which is not a recommended setting. You should contact Fujitsu support personnel before attempting to boot the SP from the backup image.

## Examples

The following command reboots the Service Processor of node "node1" into the **primary** image.

```
cluster1::> system service-processor reboot-sp -node node1 -image primary
```

```
NOTE : If your console connection is through the SP, it will be disconnected.  
Do you want to reboot the SP ? {y|n}: y
```

```
cluster1::>
```

The following command reboots the Service Processors of all nodes. Since **-image** is not specified, the Service Processors will boot into the **primary** image.

```
cluster1::> system service-processor reboot-sp -node *
```

```
NOTE : If your console connection is through the SP, it will be disconnected.
      Do you want to reboot the SP ? {y|n}: y
2 entries were acted on.

cluster1::>
```

# system service-processor show

Display the Service Processor information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system service-processor show** command displays information about the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information for the Service Processor of the specified node.

**[-type {SP|NONE|BMC}] - Type of Device**

Selects information for the Service Processors of the specified type.

**[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status**

Selects information for the Service Processors whose status matches the specified value.

**[-ip-configured {true|false}] - Is Network Configured**

Selects information for the Service Processors whose network is configured (**true**) or not configured (**false**).

**[-address <IP Address>, ...] - Public IP Address**

Selects information for the Service Processors that use the specified IP address or addresses.

**[-mac <MAC Address>] - MAC Address**

Selects information for the Service Processors that use the specified MAC address.

**[-fw-version <text>] - Firmware Version**

Selects information for the Service Processors that are running the specified firmware version.

**[-part-num <text>] - Part Number**

Selects information for the Service Processors that have the specified part number.

**[-serial-num <text>] - Serial Number**

Selects information for the Service Processors that have the specified serial number.

**[-dev-rev <text>] - Device Revision**

Selects information for the Service Processors that have the specified device revision.

**[-autoupdate-enabled {true|false}] - Is Firmware Autoupdate Enabled**

Selects information for the Service Processors that have the specified status for firmware automatic update.

## Examples

The following example displays basic information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show
Node          Type Status      IP          Firmware
              IP Address
-----
node1         SP  online     true        2.2X5      192.168.1.201
node2         SP  online     true        2.2X5      192.168.1.202
2 entries were displayed.

cluster1::>
```

The following example displays all available information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show -instance
Node: node1
          Type of Device: SP
          Status: online
Is Network Configured: true
Public IP Address: 192.168.1.201
MAC Address: ab:cd:ef:fe:ed:01
Firmware Version: 2.2X5
Part Number: Not Applicable
```

```

                Serial Number: Not Applicable
                Device Revision: Not Applicable
    Is Firmware Autoupdate Enabled: true
Node: node2
                Type of Device: SP
                Status: online
    Is Network Configured: true
                Public IP Address: 192.168.1.202
                MAC Address: ab:cd:ef:fe:ed:02
                Firmware Version: 2.2X5
                Part Number: Not Applicable
                Serial Number: Not Applicable
                Device Revision: Not Applicable
    Is Firmware Autoupdate Enabled: true
2 entries were displayed.

cluster1::>

```

The following example displays only the type, status and firmware version for the Service Processors of all the nodes.

```

cluster1::> system service-processor show -fields type,status,fw-version
node          type status fw-version
-----
node1         SP   online 2.2X5
node2         SP   online 2.2X5
2 entries were displayed.

cluster1::>

```

## system service-processor api-service check

Check API Service availability in SP/BMC

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system service-processor api-service check** checks the availability of the API service on Service Processors (SP) or Baseboard Management Controllers (BMC) in the cluster.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node to initiate the check operation. By default, all nodes check availability.

**[-port <integer>] - SP/BMC API Service Port**

This parameter specifies the port number on the SP or BMC used for the API service. By default, port 50000 is used.

**[-target-node {<nodename>|local}] - Target Node**

This parameter specifies the target node whose SP or BMC API service is to be checked. By default, all node SPs or BMCs are checked.

## Examples

The following example checks the availability of the API service on all node SPs or BMCs.

```
cluster1::*> sp api-service check -node *

Date: Tue Oct 27 03:09:19 2020
Node: cluster1-01
Port: 50000
  Local Private IPv4: ok (192.0.2.80)
  Local Public IPv4: ok (10.233.4.22)
  Local Public IPv6: ok (2020::2023)
Target Node: cluster1-02
             IPv4: ok (10.233.4.24)
             IPv6: ok (2020::2022)

Date: Tue Oct 27 03:09:19 2020
Node: cluster1-02
Port: 50000
  Local Private IPv4: ok (192.0.2.80)
  Local Public IPv4: ok (10.233.4.24)
  Local Public IPv6: ok (2020::2022)
Target Node: cluster1-01
             IPv4: ok (10.233.4.22)
             IPv6: ok (2020::2023)
2 entries were acted on.

cluster1::*>
```

# system service-processor api-service disable-installed-certificates

Disable user-installed certificates for the service processor API service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command disables user-installed certificates for secure communication with the service processor API service. Default certificates are then auto-generated.

## Examples

The following example disables user-installed certificates for the service processor API service.

```
cluster1::> system service-processor api-service disable-installed-certificates
```

# system service-processor api-service enable-installed-certificates

Enable user-installed certificates for the service processor API service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command enables user-installed certificates for secure communication with the service processor. Use the [security certificate install](#) command to install client, server and CA certificates.

## Parameters

**-vserver <Vserver Name> - Vserver**

Use this parameter to specify the Vserver on which certificates are installed.

**-server-cert <text> - Name of the Server Certificate**

Use this parameter to specify the unique name of the server certificate.

**-client-cert <text> - Name of the Client Certificate**

Use this parameter to specify the unique name of the client certificate.

**-rootca-cert <text> - Names of the Root CA Certificates**

Use this parameter to specify the unique names of server-ca or client-ca certificate.

## Examples

The following example installs server, client and rootca certificates and then enables those certificates for secure communication with the service processor.

```

cluster1::> security certificate install -vserver cluster1 -type server
cluster1::> security certificate install -vserver cluster1 -type client
cluster1::> security certificate install -vserver cluster1 -type server-ca
cluster1::> security certificate show-user-installed
Vserver      Serial Number  Certificate Name          Type
-----
cluster1 1533F133482E800F
                xxx-ca                server-ca
Certificate Authority: xxx-ca
Expiration Date: Sat Jun 01 05:11:41 2019

cluster1 1533F273AA311FDB
                xxx-client            client
Certificate Authority: xxx-ca
Expiration Date: Fri May 31 05:34:37 2019

cluster1 1533F1B321E55242
                xxx-server            server
Certificate Authority: xxx-ca
Expiration Date: Fri May 31 05:20:50 2019

cluster1::> system service-processor api-service enable-installed-certificates
-vserver cluster1 -server-cert xxx-server -client-cert xxx-client -rootca-cert xxx-
ca

```

## Related Links

- [security certificate install](#)

# system service-processor api-service modify

Modify service processor API service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system service-processor api-service modify** command modifies SP API service configuration. The SP API is a secure network API that enables Data ONTAP to communicate with the Service Processor over the network.

## Parameters

### **[-is-enabled {true|false}] - Is SP API Service Enabled**

This parameter enables or disables the API service of the Service Processor (SP) or baseboard management controller (BMC). When the API service is disabled, features like network-based

firmware updates and network-based down node log collection will not be available, and the slower serial-interface will be used for firmware updates and down node log collection.

#### **[-port <integer>] - SP API Service Port**

This parameter specifies the port number on the Service Processor used for the API service. By default, port 50000 is used.

#### **[-limit-access {true|false}] - Only Cluster Members Can Access the Service**

This parameter restricts API service access to cluster members only. By default, it is enabled.

## Examples

The following example modifies the port number used for the SP API service and then disables the SP API service.

```
cluster1::*>system service-processor api-service modify -port 50001

cluster1::*>system service-processor api-service show
Service Processor API service configuration
is-enabled: true
port: 50001
```

```
cluster1::*>system service-processor api-service modify -is-enabled false

cluster1::*>system service-processor api-service show
Service Processor API service configuration
is-enabled: false
port: 50001
```

## system service-processor api-service regenerate-ssh-auth-key

Regenerate SSH Auth Private and Public Key

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system service-processor api-service regenerate-ssh-auth-service** command regenerates public and private keys for SSH public key authentication between ONTAP nodes and their service processor (SP) or basboard management controller (BMC).

## Parameters

**-key-type {ecdsa-256|ecdsa-384|rsa-2048|rsa-3076} - SSH Key Type**

This parameter specifies the SSH authentication key type and key size that must be used when regenerating the keys. Examples: ecdsa-256, rsa-2048.

## Examples

The following example regenerates keys based on key type ECDSA and key size 256.

```
cluster1::> system service-processor api-service regenerate-ssh-auth-key -key_type
ecdsa-256
```

# system service-processor api-service renew-internal-certificates

Renew SSL and SSH certificates used for secure communication with the service processor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `system service-processor api-service renew-internal-certificates` command generates the certificates used for secure communication with the service processor API service. This command is not allowed if user-installed certificates are enabled.

## Examples

The following example generates new default host and root-ca certificates.

```
cluster1::*> system service-processor api-service renew-internal-certificates
```

# system service-processor api-service show

Display service processor API service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system service-processor api-service show` command displays the service processor (SP) or baseboard management controller (BMC) API service configuration.

## Examples

The following example displays the service processor API service configuration:

```
cluster1::*> system service-processor api-service show
Service Processor API service configuration
    Enabled: true
    Port: 50000
    Limit Access: true
Server Certificate: -internal-
Client Certificate: -internal-
CA Certificate: -internal-
```

# system service-processor image modify

Enable/Disable automatic firmware update

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor image modify` command enables or disables automatic firmware update on the Service Processor of specified node or nodes.

## Parameters

`-node {<nodename>|local}` - **Node**

The parameter specifies the node on which automatic Service Processor firmware update is to be enabled or disabled.

`[-autoupdate {true|false}]` - **Firmware Autoupdate**

Setting this parameter to **true** enables automatic firmware update. Setting this parameter to **false** disables automatic firmware update. This is a mandatory parameter.

## Examples

The following command enables automatic firmware update for the Service Processor on the local node.

```
cluster1::> system service-processor image modify -node local -autoupdate true
```

The following command enables automatic firmware update for the Service Processors on all the nodes.

```
cluster1::> system service-processor image modify -node * -autoupdate true
2 entries were modified.
```

## system service-processor image show

Display the details of currently installed Service Processor firmware image

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor image show` command displays information about the currently installed firmware images on the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**{ [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects firmware image information for the Service Processor of the specified node.

**[-image {primary|backup}] - Image**

Selects firmware image information for the Service Processors that are running the primary or backup image as specified.

**[-type {SP|NONE|BMC}] - Type**

Selects firmware image information for the Service Processors of the specified type.

**[-status {installed|corrupt|updating|auto-updating|none}] - Image Status**

Selects firmware image information for the Service Processors whose image status matches the specified value.

**[-is-current {true|false}] - Is Image Current**

Selects firmware image information for the SP whose current image matches the specified status. This parameter indicates the partition (primary or backup) that the SP is currently booted from, not whether the installed firmware version is most current.

**[-version <text>] - Firmware Version**

Selects firmware image information for the Service Processors running the specified firmware version.

**[-autoupdate {true|false}] - Firmware Autoupdate**

Selects firmware image information for the Service Processors whose automatic update matches the specified configuration.

**[-last-update-status {failed|passed}] - Last Update Status**

Selects firmware image information for the Service Processors whose last update is of the specified status.

## Examples

The following command displays basic firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show
Node          Type  Image  Status  Is Current Version
-----
node1         SP
              primary installed true   2.2X8
              backup  installed false  2.2X5
node2         SP
              primary installed true   2.2X8
              backup  installed false  2.2X5
4 entries were displayed.

cluster1::>
```

The following command displays all available firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show -instance
Node: node1
      Image: primary
      Type: SP
      Image Status: installed
      Is Image Current: true
      Firmware Version: 2.2X8
      Firmware Autoupdate: true
```

```
Last Update Status: passed
Node: node1
    Image: backup
    Type: SP
    Image Status: installed
    Is Image Current: false
    Firmware Version: 2.2X5
    Firmware Autoupdate: true
    Last Update Status: passed
Node: node2
    Image: primary
    Type: SP
    Image Status: installed
    Is Image Current: true
    Firmware Version: 2.2X8
    Firmware Autoupdate: true
    Last Update Status: passed
Node: node2
    Image: backup
    Type: SP
    Image Status: installed
    Is Image Current: false
    Firmware Version: 2.2X5
    Firmware Autoupdate: true
    Last Update Status: passed
4 entries were displayed.

cluster1::>
```

## system service-processor image update

Update Service Processor firmware

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system service-processor image update** command installs a new firmware version on the Service Processor (SP) or Baseboard Management Controller (BMC) of specified node in a cluster. If this command fails, it will display and log an appropriate error message and abort. No automatic command retries will be performed. This command also specifies which firmware image is to be installed on the SP or BMC and how.

You can use the command [system service-processor image update-progress show](#) to check the progress of the update.

The following parameter combinations are not supported for this command:

- ``-baseline`true` with ``-package`<text>`

## Parameters

### `-node {<nodename>|local}` - Node

This parameter specifies the node whose SP or BMC firmware is to be updated.

### `[-package <text>]` - Firmware Package

This parameter specifies the package that will be installed. You can find the package file in the SP Update Repository field of the [system node image package show](#) command. If you do not specify this parameter, the SP or BMC is updated to the most recent version of the firmware that is available in the update repository. You must specify this parameter if `baseline` is false or omitted.

### `[-baseline {true|false}]` - Install Baseline

If you set this parameter to true, the command installs the SP or BMC firmware version that is bundled with the currently running release of ONTAP. This is a safety mechanism that allows you to revert the SP or BMC firmware to the version that was qualified and bundled with the currently running version of ONTAP on your system. If not specified, this parameter defaults to false.

## Examples

The following command reverts the firmware on the SP or BMC of the local node to the version that was packaged with the currently running release of ONTAP. The second command displays the status of the in-progress firmware install.

```
cluster1::> system service-processor image update -node local -baseline true
```

```
cluster1::>
```

```
cluster1::> system service-processor image update-progress show
```

Node	In Progress	Start Time	Percent Done	End Time
node1	yes	8/28/2012 20:00:34	99	-
node2	no	-	0	-

2 entries were displayed.

```
cluster1::>
```

# system service-processor image update-progress show

Display status for the latest Service Processor firmware update

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor image update-progress show` command displays the progress information of firmware updates on the Service Processor (SP) or Baseboard Management Controller (BMC) of the specified nodes. The "in-progress" field displays "no" if no update is in progress. This command does not display the progress of an SP/BMC firmware update that is triggered from the SP CLI.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ -instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[ -node {<nodename>|local} ] - Node`

This parameter displays the status of SP or BMC firmware update for the specified node.

`[ -start-time <MM/DD/YYYY HH:MM:SS> ] - Latest SP Firmware Update Start Timestamp`

This parameter displays the status of the SP or BMC whose firmware update start time matches the specified value.

`[ -percent-done <integer> ] - Latest SP Firmware Update Percentage Done`

This parameter displays the status of the SP or BMC whose update completion percentage matches the specified value.

`[ -end-time <MM/DD/YYYY HH:MM:SS> ] - Latest SP Firmware Update End Timestamp`

This parameter displays the status of the SP or BMC whose firmware update end time matches the specified value.

`[ -in-progress {yes|no} ] - Is Update in Progress`

This parameter displays the update status of the SP or BMC that matches the specified in-progress status.

## Examples

The following example starts a firmware update on the local node and then uses the command `system service-processor image update-progress show` to display progress of firmware updates on SPs or BMCs of all nodes in the system.

```
cluster1::> system service-processor image update -node local -baseline true

cluster1::>

cluster1::> system node service-processor image update-progress show
```

Node	In Progress	Start Time	Percent Done	End Time
node1	yes	8/28/2012 20:00:34	99	-
node2	no	-	0	-

```
2 entries were displayed.

cluster1::>
```

## system service-processor log show-allocations

Display the Service Processor log allocation map

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor log show-allocations` command displays the allocation map of the Service Processor logs collected in the cluster. The Service Processor logs of a node are archived in the `mroot` directory of the collecting node. This command displays the sequence numbers for the Service Processor log files that reside in each collecting node.

### Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ [-instance ] ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

If you specify this parameter, the command displays the sequence numbers of Service Processor

log files that the specified node has collected.

### **[-remote-node <text>] - Remote Node**

If you specify this parameter, the command displays the sequence numbers of Service Processor log files that have been collected from the specified remote node.

### **[-seqList <integer>,...] - Log File Sequence Numbers**

If you specify this parameter, the command displays information about Service Processor log files with the specified sequence number.

## Examples

The following example displays the allocation map of the Service Processor log files in the cluster.

```
cluster1::> system service-processor log show-allocation
Node                From Which Node    Log File Sequence
-----
cluster1-01
                    cluster1-01        10, 11, 12, 13, 15
                    cluster1-02        14, 15, 16, 17
cluster1-02
                    cluster1-01        14
                    cluster1-02        11, 12, 13
4 entries were displayed.

cluster1::>
```

# system service-processor network modify

Modify the network configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system service-processor network modify** command modifies the network configuration of the Service Processor of specified node or nodes in a cluster.

If the SP automatic network configuration has been enabled, the **system service-processor network modify** command allows you to only enable or disable the SP IPv4 or Ipv6 network interface.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies the node whose Service Processor's network configuration is to be

modified.

### **-address-family {IPv4|IPv6} - Address Family**

This parameter specifies whether the IPv4 or the IPv6 configuration is to be modified.

### **[-enable {true|false}] - Interface Enabled**

This parameter enables or disables the underlying network interface for the specified **address-family**. This is a mandatory parameter.

### **[-dhcp {v4|none|v6}] - DHCP Status**

If this parameter is set to v4, the Service Processor uses network configuration from the DHCP server. Otherwise, the Service Processor uses the network address you specify. If this parameter is not set to v4 or is not specified, you must specify the IP address, netmask, prefix-length, and gateway in the command. DHCP is not supported for IPv6 configuration.

### **[-ip-address <IP Address>] - IP Address**

This parameter specifies the public IP address for the Service Processor. You must specify this parameter when the **-dhcp** parameter is not set to v4.

### **{ [-netmask <IP Address>] - Netmask**

This parameter specifies the netmask for a Service Processor that uses an IPv4 address. This parameter has no effect if the IP address family is set to IPv6. You must specify this parameter when DHCP is not v4 and the address family is IPv4.

### **[-prefix-length <integer>] - Prefix Length of Subnet Mask }**

This parameter specifies the network prefix-length of the Service Processor if the address family is set to IPv6. The parameter has no effect when the address family is set to IPv4. You must specify this parameter when DHCP is not set to v4 and when the address family is set to IPv6.

### **[-gateway <IP Address>] - Gateway IP Address**

This parameter specifies network gateway of the Service Processor. You must specify this parameter when DHCP is not set to v4.

## Examples

The following example enables the network interface for IPv4 on the Service Processor of the local node. It first displays the current network configuration information of the local node to show the network interface is initially disabled, and then enables it with IP address 192.168.1.202, netmask as 255.255.255.0 and gateway as 192.168.1.1. It displays the interim state with SP Network Setup Status field showing "in-progress". It finally displays the network configuration again to confirm the specified values took effect.

```
cluster1::> system service-processor network show -instance -node local
Node: node2
        Address Family: IPv4
        Interface Enabled: false

## system service-processor network show

Display the network configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system service-processor network show** command displays the network configuration of the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

**[ [-instance ] ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects network configuration information for the Service Processor of the specified node.

**[-address-family {IPv4|IPv6}] - Address Family**

Selects network configuration information for the Service Processors that have the specified IP

---

address family.

**[-enable {true|false}] - Interface Enabled**

Selects network configuration information for the Service Processors whose network interface for the given **address-family** is enabled or disabled as specified.

**[-type {SP|NONE|BMC}] - Type of Device**

Selects network configuration information for the Service Processors of the specified type.

**[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status**

Selects network configuration information for the Service Processors whose status matches the specified value.

**[-link-status {up|down|disabled|unknown}] - Link Status**

Selects network configuration information for the Service Processors whose link status matches the specified value.

**[-dhcp {v4|none|v6}] - DHCP Status**

Selects network configuration information for the Service Processors whose DHCP status matches the specified value.

**[-ip-address <IP Address>] - IP Address**

Selects network configuration information for the Service Processors that use the specified IP address.

**[-mac <MAC Address>] - MAC Address**

Selects network configuration information for the Service Processors that use the specified MAC address.

**[-netmask <IP Address>] - Netmask**

This parameter displays information only for the Service Processors that use the specified netmask.

**[-prefix-length <integer>] - Prefix Length of Subnet Mask**

Selects network configuration information for the Service Processors whose prefix length of subnet mask matches the specified value.

**[-router-ip <IP Address>] - Router Assigned IP Address**

Selects network configuration information for the Service Processors whose router-assigned IP address matches the specified value.

**[-link-local-ip <IP Address>] - Link Local IP Address**

Selects network configuration information for the Service Processors whose link local IP address matches the specified value.

**[-gateway <IP Address>] - Gateway IP Address**

Selects network configuration information for the Service Processors whose gateway IP address

matches the specified value.

### **[-time-last-updated <text>] - Time Last Updated**

Selects network information for the Service Processors that have the specified time stamp showing when configuration was last updated.

### **[-subnet-name <text>] - Subnet Name**

Selects network information for the Service Processors that use the specified subnet-name for SP automatic configuration.

### **[-is-ipv6-ra-enabled {true|false}] - Enable IPv6 Router Assigned Address**

Selects network information for the Service Processors that have the specified status for IPv6 router-assigned address.

### **[-setup-status {not-setup|succeeded|in-progress|failed}] - SP Network Setup Status**

Selects network information for the Service Processors that have the specified status for network interface setup.

### **[-setup-failure-reason {success|subnet-out-of-address|invalid-subnet|other-error}] - SP Network Setup Failure Reason**

Selects network information for the Service Processors that have the specified reason for network interface setup failure.

## Examples

The following example displays basic network configuration information for the Service Processors of all the nodes.

```
cluster1::> system service-processor network show
                                     Address
Node      Status      Type      Link State  IP Address
-----
node1     online      IPv4      up          192.168.1.201
DHCP: v4
                                     MAC Address: ab:cd:ef:fe:ed:01
                                     Network Gateway: 192.168.1.1
                                     Network Mask (IPv4 only): 255.255.255.0
                                     Prefix Length (IPv6 only): -

# system service-processor network auto-configuration disable

## Disable Service Processor Auto-Configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system service-processor network auto-configuration disable** command disables the SP's use of subnet resource for the automatic configuration of its networking port. This command is a cluster-wide configuration. When you disable the SP automatic network configuration, all SPs in the cluster will be configured to use IPv4 DHCP. Any addresses previously allocated from the subnet to the SP will be released. If the SP fails to obtain an IPv4 IP address from the DHCP server, an EMS message warns you about the failure. The IPv6 interface will be disabled.

## Parameters

### -address-family {IPv4|IPv6} - Subnet Address Family

This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be disabled for the SP.

## Examples

The following example disables the automatic configuration for IPv4 on the SP. It first displays the current network configuration and then disables the SP IPv4 automatic network configuration.

```

cluster1::>system service-processor network show
      Address
Node      Status      Family  Link State  IP Address
-----
node1
          online      IPv4    up          192.168.1.2
          DHCP: none
          MAC Address: ab:cd:ef:fe:ed:01
          Network Gateway: 192.168.1.1
          Network Mask (IPv4 only): 255.255.255.0
          Prefix Length (IPv6 only): -

```

```

IPv6 RA Enabled: -
Subnet Name: ipv4_test
SP Network Setup Status: succeeded

```

```

cluster1::>system service-processor network auto-configuration disable -address-family
Ipv4

```

```

cluster1::>system service-processor network auto-configuration show
Cluster Name          SP IPv4 Subnet Name          SP IPv6 Subnet Name
-----
cluster1              -                              -

```

```

cluster1::>system service-processor network show
Node          Status          Address
Family      Link State     IP Address
-----
node1
online       IPv4           up           192.168.1.184
DHCP: v4
MAC Address: ab:cd:ef:fe:ed:01
Network Gateway: 192.168.1.1
Network Mask (IPv4 only): 255.255.255.0
Prefix Length (IPv6 only): -
IPv6 RA Enabled: -
Subnet Name: -
SP Network Setup Status: succeeded

```

## system service-processor network auto-configuration enable

### Enable Service Processor Auto-Configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system service-processor network auto-configuration enable** command enables the automatic network configuration for the SP. This is a cluster-wide configuration. Every node in the cluster will use the specified subnet to allocate IP address, subnet mask and gateway address for the SP configuration. When the SP automatic network configuration is enabled, you do not need to manually manage the SP network of individual nodes. A node that subsequently joins the cluster uses the specified subnet to configure its SP network automatically.

Prior to running this command, the subnet you want to use for the SP automatic network

configuration must already be defined in the cluster and must have no resource conflicts with the SP network interface.

## Parameters

### -address-family {IPv4|IPv6} - Subnet Address Family

This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be enabled for the SP.

### -subnet-name <text> - Subnet Name

This parameter specifies the network subnet that the SP will use for automatic network configuration.

## Examples

The following example enables the automatic network configuration for IPv4 on the SP. It first displays the current SP network configuration, displays available network subnet in the cluster, and then enable the SP to use the subnet for IPv4 automatic configuration.

```
cluster1::>system service-processor network show
                                     Address
Node      Status      Family   Link State  IP Address
-----
node1
DHCP: v4   online      IPv4     up          192.168.1.201
          MAC Address: ab:cd:ef:fe:ed:01
          Network Gateway: 192.168.1.1
          Network Mask (IPv4 only): 255.255.255.0
          Prefix Length (IPv6 only): -
          IPv6 RA Enabled: -
          Subnet Name: -
          SP Network Setup Status: succeeded
```

```
cluster1::> network subnet show

IPspace: Default
Subnet
Name      Subnet      Broadcast      Avail/
          Subnet      Domain         Gateway        Total  Ranges
-----
ipv4_test 192.168.1.0/24  Default      192.168.1.1    3/5    192.168.1.2-192.168.1.6
```

```
cluster1::>system service-processor network auto-configuration enable -address-family
ipv4 -subnet-name ipv4_test

cluster1::system service-processor network> show
```

```

Node           Status      Address
              Family    Link State  IP Address
-----
node1
              online    IPv4        up          192.168.1.2
DHCP: none
              MAC Address: ab:cd:ef:fe:ed:01
              Network Gateway: 192.168.1.1
              Network Mask (IPv4 only): 255.255.255.0
              Prefix Length (IPv6 only): -
              IPv6 RA Enabled: -
              Subnet Name: ipv4_test
              SP Network Setup Status: succeeded

```

## system service-processor network auto-configuration show

Display Service Processor Auto-Configuration Setup

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system service-processor network auto-configuration show** command displays the names of the IPv4 and IPv6 network subnet objects configured in the cluster that the SP uses for automatic configuration.

### Examples

The following example shows that the SP is configured to use the "ipv4\_test" IPv4 subnet in the cluster for the SP automatic network configuration.

```

cluster1::>system service-processor network auto-configuration show
Cluster Name      SP IPv4 Subnet Name      SP IPv6 Subnet Name
-----
cluster1         ipv4_test                -

```

## system service-processor ssh add-allowed-addresses

Add IP addresses to the list that is allowed to access the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh add-allowed-addresses` command grants IP addresses access to the Service Processor.

## Parameters

`-allowed-addresses <IP Address/Mask>,...` - Public IP Addresses

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs. If "0.0.0.0/0, ::/0" is specified in the parameter, any IP address is allowed to access the Service Processor.

## Examples

The following examples grant the specified IP addresses access to the Service Processor and display the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
  Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::> system service-processor ssh add-allowed-addresses -allowed-addresses
192.168.1.202/24, 192.168.10.201/24
Warning: The default "allow all" setting (0.0.0.0/0, ::/0) will be replaced
with your changes. Do you want to continue? {y|n}: y

cluster1::> system service-processor ssh show
  Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

The following example enables all IP addresses to access the Service Processor.
cluster1::> system service-processor ssh add-allowed-addresses -allowed-addresses
0.0.0.0/0, ::/0

cluster1::> system service-processor ssh show
  Allowed Addresses: 0.0.0.0/0, ::/0
cluster1::>
```

## system service-processor ssh remove-allowed-addresses

Remove IP addresses from the list that is allowed to access the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh remove-allowed-addresses` command blocks the specified IP address from accessing the Service Processor. If all IP addresses are removed from the access list, then the Service Processor is not accessible from any IP address.

## Parameters

**-allowed-addresses <IP Address/Mask>, ... - Public IP Addresses**

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs.

## Examples

The following example prevents the specified IP addresses from accessing the Service Processor. It also displays the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
  Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

cluster1::> system service-processor ssh remove-allowed-addresses -allowed-addresses
192.168.1.202/24, 192.168.10.201/24

Warning: If all IP addresses are removed from the allowed address list, all IP
addresses will be denied access. To restore the "allow all" default,
use the "system service-processor ssh add-allowed-addresses
-allowed-addresses 0.0.0.0/0, ::/0" command. Do you want to continue?
{y|n}: y

cluster1::> system service-processor ssh show
  Allowed Addresses: -

cluster1::>
```

## system service-processor ssh show

Display SSH security information about the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh show` command displays the IP addresses that are allowed to access the Service Processor by using SSH.

## Examples

The following example displays SSH security information about the Service Processor.

```
cluster1::> system service-processor ssh show
  Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::>
```

# system services firewall modify

Modify firewall status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services firewall modify` command modifies a node's firewall configuration.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which to modify firewall configuration.

**[-enabled {true|false}] - Service Enabled**

Use this parameter to specify whether firewall protection is enabled ("**true**") or disabled ("**false**") for the node's network ports. The default setting is **true**.

**[-logging {true|false}] - (DEPRECATED)-Enable Logging**

This parameter is deprecated and may be removed in a future version of Data ONTAP.

Use this parameter to specify whether logging is enabled ("**true**") or disabled ("**false**") for the firewall service. The default setting is **false**.

## Examples

The following example enables firewall protection and logging for a node named node1:

```
cluster1::> system services firewall modify -node node1 -enabled true -logging true
```

# system services firewall show

Show firewall status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services firewall show` command displays firewall configuration and logging information. If the command is issued without any parameters, it displays information about all nodes in the cluster. You can also query specific nodes for their firewall information by running the command with the `-node` parameter.

## Parameters

`{[-fields <fieldname>,...]}`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance ]}`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

Selects information about the firewall settings on the node you specify.

`[-enabled {true|false}] - Service Enabled`

Selects information about the nodes with the firewall enabled ("**true**") or disabled ("**false**").

`[-logging {true|false}] - (DEPRECATED)-Enable Logging`

This parameter is deprecated and may be removed in a future version of Data ONTAP.

Selects information about the nodes with firewall logging enabled ("**true**") or disabled ("**false**").

## Examples

The following example displays information about firewall configuration for all nodes in the cluster:

```
cluster1::> system services firewall show
Node           Enabled Logging
-----
node0          true   false
node1          true   false
node2          true   false
node3          true   false
```

4 entries were displayed.

# system services firewall policy clone

(DEPRECATED)-Clone an existing firewall policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy clone](#) instead.

The **system services firewall policy clone** command creates a new firewall policy that is an exact copy of an existing policy, but has a new name.

## Parameters

### **-vserver <text> - Vserver owning the Policy**

Use this parameter to specify the name of the Vserver owning the existing policy to copy.

### **-policy <text> - Firewall Policy to be Cloned**

Use this parameter to specify the name of the existing policy to copy.

### **[-destination-vserver <text>] - Vserver owning the New Firewall Policy**

Use this parameter to specify the name of the Vserver that will own the new policy to create.

### **-destination-policy <text> - Name of New Firewall Policy**

Use this parameter to specify the name of the new policy to create.

## Examples

This example creates a new firewall policy named "data2" on Vserver "vs0" from an existing firewall policy named "data" on Vserver "vs1".

```
cluster1::> system services firewall policy clone -vserver vs0 -policy data  
-destination-vserver vs1 -destination-policy data2
```

## Related Links

- [network interface service-policy clone](#)

# system services firewall policy create

(DEPRECATED)-Create a firewall policy entry for a network service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy create](#) or [network interface service-policy add-service](#) instead.

The **system services firewall policy create** command creates a firewall policy entry with the specified name and network service. This command is used both to create the first network service associated with a new firewall policy, and to add to an existing firewall policy by associating another network service with an existing policy. You can optionally specify one or more IP addresses with corresponding netmasks that are allowed to use the firewall policy entry.

You can use the [network interface modify](#) command with the **-firewall-policy** parameter to put a firewall policy into effect for a given logical interface by modifying that logical interface to use the specified firewall policy.

You can use this command to create an empty firewall policy by creating a single policy entry for the "none" firewall service. When used by a logical network interface (LIF), an empty firewall policy will block all services managed using firewall policies.

## Parameters

### **-vserver <vserver> - Vserver Name**

Use this parameter to specify the name of the Vserver on which the policy is to be created.

### **-policy <textpolicy\_name> - Policy**

Use this parameter to specify the name of the policy that is to be created.

### **-service <service> - Service**

Use this parameter to specify the network service that is associated with the policy. Possible values include:

- dns - The DNS protocol server
- http - The HTTP protocol
- ndmp - The NDMP tape backup protocol
- ndmps - The NDMPs tape backup protocol
- none - No protocol (for creating an empty policy)
- ntp - The NTP protocol

- rsh - The RSH protocol
- snmp - The SNMP protocol
- telnet - The Telnet protocol

#### **-allow-list <IP Address/Mask>,...** - Allowed IPs

Use this parameter to specify one or more IP addresses with corresponding netmasks that are to be allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value **0.0.0.0/0** for "any".

## Examples

The following example creates a firewall policy named data that uses the NDMP protocol and enables access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service ndmp -allow
-list 192.0.2.128/25
```

The following example adds an entry to the firewall policy named data, associating the DNS protocol with that policy and enabling access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service dns -allow
-list 192.0.2.128/25
```

# system services firewall policy delete

(DEPRECATED)-Remove a service from a firewall policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy delete](#) or [network interface service-policy remove-service](#) instead.

The **system services firewall policy delete** command deletes a firewall policy. You cannot delete a

policy that is being used by a logical interface. Use the [network interface modify](#) command with the `-firewall-policy` parameter to change a network interface's firewall policy.

## Parameters

### `-vserver <vserver>` - Vserver Name

Use this parameter to specify the Vserver of the policy to delete.

### `-policy <textpolicy_name>` - Policy

Use this parameter to specify the name of the policy to delete.

### `-service <service>` - Service

Use this parameter to specify the policy's network service to delete.

## Examples

The following example deletes a firewall policy that uses the Telnet protocol on the policy named data:

```
cluster1::> system services firewall policy delete -policy data -service telnet
```

Use wildcards to delete entire policies at once, or particular services from every policy. This example deletes the entire intercluster policy.

```
cluster1::> system services firewall policy delete -policy intercluster -service *
```

This example deletes the telnet service from every policy.

```
cluster1::> system services firewall policy delete -policy * -service telnet
```

- [network interface modify](#)

# system services firewall policy modify

(DEPRECATED)-Modify a firewall policy entry for a network service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy modify-service](#) instead.

The [system services firewall modify](#) command enables you to modify the list of IP addresses and netmasks associated with a firewall policy.

## Parameters

### **-vserver <vserver> - Vserver Name**

Use this parameter to specify the Vserver of the policy to modify.

### **-policy <textpolicy\_name> - Policy**

Use this parameter to specify the name of the policy to modify.

### **-service <service> - Service**

Use this parameter to specify the policy's network service to modify.

### **[-allow-list <IP Address/Mask>, ...] - Allowed IPs**

Use this parameter to specify one or more IP addresses with corresponding netmasks that are allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value **0.0.0.0/0** for "any".

## Examples

The following example modifies the firewall policy named data that uses the NDMP protocol to enable access from all addresses on the 192.0.2.128 subnet:

```
cluster1::> system services firewall policy modify -policy data -service ndmp -allow  
-list 192.0.2.128/25
```

- [network interface service-policy modify-service](#)
- [system services firewall modify](#)

# system services firewall policy show

(DEPRECATED)-Show firewall policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy show](#) instead.

The `system services firewall policy show` command displays information about firewall policies.

Some firewall policies contain a single entry for the "none" firewall service. You can consider these policies to be empty. When used by a logical network interface (LIF), an empty firewall policy will block all services managed using firewall policies.

## Parameters

`{ [-fields <fieldname>, ... ] }`

If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.

`[ -instance ] }`

Use this parameter to display all the fields for the specified policies.

`[-vserver <vserver>] - Vserver Name`

Use this parameter to display information only about the Vserver you specify.

`[-policy <textpolicy_name>] - Policy`

Use this parameter to display information about the policy you specify.

`[-service <service>] - Service`

Use this parameter to display information about the services you specify.

`[-allow-list <IP Address/Mask>, ... ] - Allowed IPs`

Use this parameter to display information about the firewall policies that match the list of allowed IP addresses and netmasks you specify. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas.

`[-ipspace <text>] - IPspace`

Use this parameter to display information only about the IPspace you specify.

## Examples

The following example displays information about all firewall policies:

```
cluster1::> system services firewall policy show
Vserver Policy      Service      Allowed
-----
cluster1
  data
      dns      0.0.0.0/0, ::/0

# system services manager install show

Display a list of installed services

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager install show` command displays information about installed services.

## Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ]}**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-service <text>`] - Service**

Selects information about installed services that have the name you specify.

**[`-version <service version>`] - Version**

Selects information about installed services that have the version number you specify.

**[`-constituent <text>`] - Constituent**

Selects information about installed services that have the constituent process you specify.

**[`-nodes {<nodename>|local}`] - Nodes**

Selects information about services that are installed on the nodes you specify.

**[`-description <text>`] - Description**

Selects information about installed services that match the description you specify.

## Examples

The following example shows typical output from a two-node cluster.

```
cluster1::> system services manager install show
Service          Version Constituent Nodes
-----
diagnosis
                1.0     schmd     node1, node2
                1.0     shmd     node1, node2
2 entries were displayed.
```

# system services manager policy add

Add a new service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system services manager policy add** command adds a new service policy to the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

## Parameters

**-service <text> - Service**

Use this parameter to specify the name of the service for which to add a policy.

**-version <service version> - Version**

Use this parameter to specify the minimum version number of the service to run.

## Examples

This example adds a service manager policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy add -service diagnosis -version 1.0
```

# system services manager policy remove

Remove a service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system services manager policy remove** command removes a policy from the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

## Parameters

**-service <text> - Service**

Use this parameter to specify the name of the service from which to remove a policy.

**-version <service version> - Version**

Use this parameter to specify the version number that is configured by the policy to remove.

## Examples

The following example shows the removal of the service policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy remove -service diagnosis -version 1.0
```

# system services manager policy setstate

Enable/disable a service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager policy setstate` command enables or disables services manager policies. Use the [system services manager policy show](#) command to display information about configured policies.

## Parameters

**-service <text> - Service**

Use this parameter to set the state of the policy you specify.

**-version <service version> - Version**

Use this parameter to set the state of the policy with the version number you specify.

**-state {on|off} - State**

Use this parameter with the value "on" to enable the policy. Use this parameter with the value "off" to disable the policy.

## Examples

The following example sets the policy for version 1.0 of the diagnosis service to off.

```
cluster1::> system services manager policy setstate -service diagnosis -version 1.0  
-state off
```

## Related Links

- [system services manager policy show](#)

# system services manager policy show

Display service policies

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager policy show` command displays information about policies that determine which versions of a service can run on the nodes of the cluster.

Use the [system services manager status show](#) command to view information about services that are configured to run in the cluster.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -service <text> ] - Service**

Selects policies that apply to the service you specify.

**[ -version <service version> ] - Version**

Selects policies that have the version number you specify.

**[ -constituent <text> ] - Constituent**

Selects policies that have the constituent process you specify.

**[ -state {on|off} ] - State**

Use this parameter with the value "on" to select information about policies that are currently active. Use this parameter with the value "off" to select information about policies that are not currently active.

**[ -num-active <integer> ] - Number Active**

Selects policies that have the number of active (running) instances you specify.

**[ -target-nodes <service affinity>, ... ] - Target Nodes**

Selects policies that are configured to run on the nodes you specify.

**[ -tag <UUID> ] - Tag**

Selects policies that have the UUID you specify. Use this parameter with the **-fields** parameter to display a list of the UUIDs of configured services.

## Examples

The following example shows typical output for this command.

```
cluster1::> system services manager policy show
Service          Version State Constituent Number Target
                  Active Nodes
-----
diagnosis
                1.0    on    schmd    1      any
                1.0    on    shmd    1      any
2 entries were displayed.
```

## Related Links

- [system services manager status show](#)

# system services manager status show

Display the status of a service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system services manager status show** command displays the status of system services that are configured to run in the cluster.

System services run on the nodes of the cluster based on policies. Policies determine which versions of a service can run on the nodes of the cluster. Use the [system services manager policy show](#) command to view existing policies.

## Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ -instance ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[ -service <text> ] - **Service**

Selects information about services that match the service name you specify.

[ -version <service version> ] - **Version**

Selects information about services that are configured to run the version number you specify. The configured version is the minimum version that is allowed to run in the cluster according to a policy. Use the [system services manager policy show](#) command to view information about service policies.

[ -constituent <text> ] - **Constituent**

Selects information about services that have the constituent process you specify.

[ -actual-version <service version> ] - **Actual Version**

Selects information about services that are running the version number you specify. This number can be higher than the configured version if a more recent version is installed on the node that is running the service.

**[-node <nodename>] - Node**

Selects information about services that the services manager has assigned to run on the nodes you specify. If the service state is "running", the service is running on these nodes.

**[-state <svc\_state>] - State**

Selects information about services that are in the state you specify.

**[-is-running {true|false}] - Is Running**

Use this parameter with the value "true" to select information about services that are currently running. Use this parameter with the value "false" to select information about services that are not currently running.

## Examples

The example below shows typical output for a simple cluster.

```
cluster1::> system services manager status show
Service          Version Constituent Actual Node          State
                Version
-----
diagnosis
                1.0     schmd     1.0     cluster1-01   running
                1.0     shmd     1.0     cluster1-01   running
2 entries were displayed.
```

# system services ndmp kill-all

Kill all NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system services ndmp kill-all** command is used to terminate all NDMP sessions on a particular node in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

Node on which all NDMP sessions needs to be terminated.

## Examples

The following example shows how all NDMP sessions on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill-all -node node1
```

## system services ndmp kill

Kill the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services ndmp kill` command is used to terminate a specific NDMP session on a particular node in the cluster.

### Parameters

<integer> - **Session Identifier**

Session ID of the NDMP session.

### Examples

The following example shows how a specific NDMP session on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill 4323 -node node1
```

## system services ndmp modify

(DEPRECATED)-Modify NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp modify](#)" command.

The `system services ndmp modify` command allows you to modify the NDMP configurations for a

node in the cluster. One or more of the following configurations can be modified:

- Enable/disable NDMP service
- Enable/disable sending the NDMP password in clear text. Note that MD5 authentication mode is always enabled.
- NDMP user ID

## Parameters

### **-node {<nodename>|local} - Node**

This specifies the node whose NDMP configuration is to be modified.

### **[-enable {true|false}] - NDMP Service Enabled**

This optionally specifies whether NDMP is enabled on the node. The default setting is **true**.

### **[-clear-text {true|false}] - Allow Clear Text Password**

This optionally specifies whether the NDMP password can be sent in clear text. The default setting is **true**.

### **[-user-id <text>] - NDMP User ID**

This optionally specifies the ID of the NDMP user.

## Examples

The following example modifies the NDMP configuration on a node named node1. The configuration enables NDMP, disables sending the password in clear text, and specifies an NDMP user named ndmp:

```
cluster1::> system services ndmp modify -node node1 -enable true
-clear-text false -user-id ndmp
```

# system services ndmp off

(DEPRECATED)-Disable NDMP service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP

functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp off](#)" command.

The `system services ndmp off` command is used to disable the NDMP service on any node in the cluster.

## Parameters

`-node {<nodename>|local}` - Node

The specific node on which NDMP service is to be disabled.

## Examples

The following example is used to turn off the NDMP service on node named node1:

```
cluster1::> system services ndmp off -node node1
```

## Related Links

- [vserver services ndmp off](#)

# system services ndmp on

(DEPRECATED)-Enable NDMP service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp on](#)" command.

The `system services ndmp on` command is used to enable the NDMP service across any node in the cluster.

## Parameters

`-node {<nodename>|local}` - Node

The specific node on which the NDMP service is to be enabled.

## Examples

The following example is used to turn on the NDMP service on node named node1:

```
cluster1::> system services ndmp on -node node1
```

## Related Links

# system services ndmp password

(DEPRECATED)-Change the NDMP password for the node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp generate-password](#)" command.

The `system services ndmp password` command is used to change the NDMP password for a node in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

The specific node for which the password is to be changed.

## Examples

The following example is used to change the NDMP password for the node named node1:

```
cluster1::> system services ndmp password -node node1
```

```
Please enter password:
```

```
Confirm password:
```

# system services ndmp probe

Display list of NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system services ndmp probe** command displays diagnostic information about all the NDMP sessions in the cluster. The following fields are displayed for each of the sessions:

- Node
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset
- Mover window length
- Mover position
- Mover SetRecordSize flag
- Mover SetWindow flag
- Mover connect type
- Mover connect address
- Mover connect port
- Effective host

- NDMP client address
- NDMP client port
- SCSI device ID
- SCSI hostadapter
- SCSI target ID
- SCSI LUN ID
- Tape device
- Tape mode
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

## Parameters

### **[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

### **[-session-id <integer>] - Session Identifier**

If this parameter is specified, the command displays information only about the specified session.

### **[-ndmp-version <integer>] - NDMP Version**

This parameter refers to the NDMP protocol version being used in the session.

### **[-session-authorized {true|false}] - Session Authorized**

This parameter indicates whether an NDMP session is authenticated or not.

### **[-data-state <component state>] - Data State**

This parameter identifies the current state of the data server's state machine.

### **[-data-operation <data operation>] - Data Operation**

This parameter identifies the data server's current operation.

### **[-data-halt-reason <halt reason>] - Data Server Halt Reason**

This parameter identifies the event that caused the data server state machine to enter the HALTED state.

### **[-data-con-addr-type <address type>] - Data Server Connect Type**

This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

**[-data-con-addr <text>] - Data Server Connect Address**

This parameter specifies the connection endpoint information for the data server's data connection.

**[-data-con-port <integer>] - Data Server Connect Port**

This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.

**[-data-bytes-processed <integer>] - Data Bytes Processed**

This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

**[-mover-state <component state>] - Mover State**

This parameter identifies the current state of the NDMP tape server's mover state machine.

**[-mover-mode <mover mode>] - Mover Mode**

This parameter identifies the direction of the mover data transfer.

**[-mover-pause-reason <pause reason>] - Mover Pause Reason**

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

**[-mover-halt-reason <halt reason>] - Mover Halt Reason**

This parameter identifies the event that caused the mover state machine to enter the HALTED state.

**[-mover-record-size <integer>] - Mover Record Size**

This parameter represents the current mover record size in bytes.

**[-mover-record-num <integer>] - Mover Record Number**

This parameter represents the last tape record processed by the mover.

**[-mover-bytes-moved <integer>] - Mover Bytes Moved**

This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

**[-mover-seek-position <integer>] - Mover Seek Position**

This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

**[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read**

This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP\_MOVER\_READ request.

**[-mover-window-offset <integer>] - Mover Window Offset**

This parameter represents the absolute offset of the first byte of the mover window within the

overall data stream.

**[-mover-window-length <integer>] - Mover Window Length**

This parameter represents the length of the current mover window in bytes.

**[-mover-position <integer>] - Mover Position**

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

**[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag**

This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

**[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag**

This parameter represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

**[-mover-con-addr-type <address type>] - Mover Connect Type**

This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

**[-mover-con-addr <text>] - Mover Connect Address**

This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

**[-mover-con-port <integer>] - Mover Connect Port**

This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

**[-eff-host <host type>] - Effective Host**

This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

**[-client-addr <text>] - NDMP Client Address**

This parameter specifies the client's IP address.

**[-client-port <integer>] - NDMP Client Port**

This parameter specifies the client's port number.

**[-spt-device-id <text>] - SCSI Device ID**

This parameter specifies the SCSI device ID.

**[-spt-ha <integer>] - SCSI Host Adapter**

This parameter specifies the SCSI host adapter.

**[-spt-scsi-id <integer>] - SCSI Target ID**

This parameter specifies the SCSI target.

**[-spt-scsi-lun <integer>] - SCSI LUN ID**

This parameter specifies the SCSI LUN ID.

**[-tape-device <text>] - Tape Device**

This parameter specifies the name to identify the tape device.

**[-tape-mode <mover mode>] - Tape Mode**

This parameter specifies the mode in which tapes are opened.

**[-is-secure-control-connection {true|false}] - Is Secure Control Connection**

This parameter specifies whether the control connection is secure or not.

**[-data-backup-mode <text>] - Data Backup Mode**

This parameter specifies whether the mode of data backup is Dump or SMTape.

**[-data-path <text>] - Data Path**

This parameter specifies the path of data being backed up.

**[-source-addr <text>] - NDMP Source Address**

This parameter specifies the control connection IP address of the NDMP session.

## Examples

The following example displays diagnostic information about all the sessions in the cluster:

```
cluster1::> system services ndmp probe
Node: cluster1-01
  Session identifier: 4952
    NDMP version: 4
  Session authorized: true
    Data state: IDLE
    Data operation: NOACTION
  Data server halt reason: NA
  Data server connect type: LOCAL
  ....
  ...

Node: cluster1-02
  Session identifier: 5289
    NDMP version: 4
  Session authorized: true
    Data state: IDLE
    Data operation: NOACTION
  Data server halt reason: NA
  Data server connect type: LOCAL
```

```
....
...
```

The following example displays diagnostic information of sessions running on the node cluster1-01 only:

```
cluster1::> system services ndmp probe -node cluster1-01
Node: cluster1-01
  Session identifier: 4952
    NDMP version: 4
  Session authorized: true
    Data state: IDLE
    Data operation: NOACTION
  Data server halt reason: NA
  Data server connect type: LOCAL
....
...
```

## system services ndmp show

(DEPRECATED)-Display NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp show](#)" command.

The **system services ndmp show** command displays the following information about the NDMP configuration across all the nodes in the cluster:

- Node name
- Whether NDMP is enabled on the node
- Whether sending the NDMP password in clear text is enabled on the node
- NDMP user ID

A combination of parameters can be optionally supplied to filter the results based on specific criteria.

### Parameters

```
{ [-fields <fieldname>,...]
```

If this parameter is specified, the command displays only the fields that you specify.

**[`-instance` ]}**

If this parameter is specified, the command displays detailed information about all entries.

**[`-node {<nodename>|local}`] - Node**

Selects information about the specified node.

**[`-enable {true|false}`] - NDMP Service Enabled**

Selects information about the nodes where NDMP is enabled/disabled.

**[`-clear-text {true|false}`] - Allow Clear Text Password**

Selects information about the nodes whose clear-text setting matches the specified value.

**[`-user-id <text>`] - NDMP User ID**

Selects information about the nodes that have the specified NDMP user ID.

## Examples

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp show
Node          Enabled   Clear Text  User ID
-----
node0         true     true        ndmp
node1         true     true        ndmp
node2         true     true        ndmp
node3         true     true        ndmp
4 entries were displayed.
```

# system services ndmp status

Display list of NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services ndmp status` command lists all the NDMP sessions in the cluster. By default it lists the following details about the active sessions:

- Node
- Session ID

A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section.

## Parameters

{ [-fields <fieldname>, ...]

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port
- data-bytes-processed
- mover-state
- mover-mode
- mover-pause-reason
- mover-halt-reason
- mover-record-size
- mover-record-num
- mover-bytes-moved
- mover-seek-position
- mover-bytes-left-to-read
- mover-window-offset
- mover-window-length
- mover-position
- mover-setrecordsize-flag
- mover-setwindow-flag
- mover-con-addr-type
- mover-con-addr
- mover-con-port
- eff-host

- client-addr
- client-port
- spt-device-id
- spt-ha
- spt-scsi-id
- spt-scsi-lun
- tape-device
- tape-modes
- is-secure-control-connection
- data-backup-mode
- data-path
- source-addr

**[`-instance`] }**

If this parameter is specified, the command displays detailed information about all the active sessions.

**[`-node` {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

**[`-session-id` <integer>] - Session Identifier**

If this parameter is specified, the command displays information about specific NDMP session. A session-id is a number used to identify a particular NDMP session.

**[`-ndmp-version` <integer>] - NDMP Version**

This parameter refers to the NDMP protocol version being used in the session.

**[`-session-authorized` {true|false}] - Session Authorized**

This field indicates whether an NDMP session is authenticated or not.

**[`-data-state` <component state>] - Data State**

This field identifies the current state of the data server's state machine.

**[`-data-operation` <data operation>] - Data Operation**

This field identifies the data server's current operation.

**[`-data-halt-reason` <halt reason>] - Data Server Halt Reason**

This field identifies the event that caused the data server state machine to enter the HALTED state.

**[`-data-con-addr-type` <address type>] - Data Server Connect Type**

This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked

systems.

**[-data-con-addr <text>] - Data Server Connect Address**

This specifies the connection endpoint information for the data server's data connection.

**[-data-con-port <integer>] - Data Server Connect Port**

This specifies the TCP/IP port that the data server will use when establishing a data connection.

**[-data-bytes-processed <integer>] - Data Bytes Processed**

This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

**[-mover-state <component state>] - Mover State**

This parameter identifies the current state of the NDMP tape server's mover state machine.

**[-mover-mode <mover mode>] - Mover Mode**

This parameter identifies the direction of the mover data transfer.

**[-mover-pause-reason <pause reason>] - Mover Pause Reason**

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

**[-mover-halt-reason <halt reason>] - Mover Halt Reason**

This integer field identifies the event that caused the mover state machine to enter the HALTED state.

**[-mover-record-size <integer>] - Mover Record Size**

This field represents the current mover record size in bytes.

**[-mover-record-num <integer>] - Mover Record Number**

This field represents the last tape record processed by the mover.

**[-mover-bytes-moved <integer>] - Mover Bytes Moved**

This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

**[-mover-seek-position <integer>] - Mover Seek Position**

This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

**[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read**

This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP\_MOVER\_READ request.

**[-mover-window-offset <integer>] - Mover Window Offset**

This field represents the absolute offset of the first byte of the mover window within the overall data stream.

**[-mover-window-length <integer>] - Mover Window Length**

This field represents the length of the current mover window in bytes.

**[-mover-position <integer>] - Mover Position**

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

**[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag**

This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

**[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag**

This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

**[-mover-con-addr-type <address type>] - Mover Connect Type**

This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

**[-mover-con-addr <text>] - Mover Connect Address**

This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

**[-mover-con-port <integer>] - Mover Connect Port**

This specifies the TCP/IP port that the mover will use when establishing a data connection.

**[-eff-host <host type>] - Effective Host**

This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

**[-client-addr <text>] - NDMP Client Address**

This parameter specifies the client's IP address.

**[-client-port <integer>] - NDMP Client Port**

This parameter specifies the client's port number.

**[-spt-device-id <text>] - SCSI Device ID**

This parameter specifies the SCSI device ID.

**[-spt-ha <integer>] - SCSI Host Adapter**

This parameter specifies the SCSI host adapter.

**[-spt-scsi-id <integer>] - SCSI Target ID**

This parameter specifies the SCSI target.

**[-spt-*scsi-lun* <integer>] - SCSI LUN ID**

This parameter specifies the SCSI LUN ID.

**[-tape-device <text>] - Tape Device**

This parameter specifies the name to identify the tape device.

**[-tape-mode <mover mode>] - Tape Mode**

This parameter specifies the mode in which tapes are opened.

**[-is-secure-control-connection {true|false}] - Is Secure Control Connection**

This parameter specifies whether the control connection is secure or not.

**[-data-backup-mode <text>] - Data Backup Mode**

This parameter specifies whether the mode of data backup is Dump or SMTape.

**[-data-path <text>] - Data Path**

This parameter specifies the path of data being backed up.

**[-source-addr <text>] - NDMP Source Address**

This parameter specifies the control connection IP address of the NDMP session.

## Examples

The following example displays all the NDMP sessions on the cluster:

```
cluster1::> system services ndmp status
                Session
Node           Id
-----
node-01       17479
node-01       19769
node-02       21118
3 entries were displayed.
```

The following example shows how to display only the sessions running on node-01:

```
cluster1::> system services ndmp status -node node-01
                Session
Node           Id
-----
node-01       17479
node-01       19769
2 entries were displayed.
```

# system services ndmp log start

(DEPRECATED)-Start logging for the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp log start" command.

This command is used to start logging on an active NDMP session on a node. You can start logging two different kinds of sessions. The NDMP **server** session manages all NDMP tasks on the node. If you want to log information regarding the NDMP server, use **server** with the **-session-id** parameter to enable logging. If you want to log information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the **-session-id** parameter to enable logging.

## Parameters

**-node** {<nodename>|local} - **Node**

This parameter specifies the node.

**-session-id** {<integer>|server} - **Session Identifier**

This parameter specifies the NDMP session-id on which logging needs to be started. The session-id is associated with a unique NDMP session. Specify **server** to start logging on the NDMP server session.

**-filter** <text> - **Level Filter**

Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow : **all** , **none** , **normal** , **backend** or "**filter-expression**". The default value for this is **none** .

- **all** turns on logging for all modules.
- **none** disables logging for all modules.
- **normal** is a short cut parameter that enables logging for all modules except **verbose** and **io\_loop** . The equivalent filter string is **all-verbose-io\_loop**
- **backend** is a short cut parameter that enables logging for all modules except **verbose** , **io\_loop** , **ndmps** and **ndmpd** . The equivalent filter string is **all-verbose-io\_loop-ndmps-ndmpp**
- **(filter-expression)** is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators :
- - to remove the given module from the list of specified modules in the filter string. For example the filter **all-ndmpp** will enable logging for all modules but not **ndmpp** .

- **^** to add the given module or modules to the list of modules specified in the filter string. For example the filter **ndmpp<sup>mover</sup>data** will enable logging for **ndmpp** , **mover** and **data** .

The possible module names and a brief description is given below:

Modules	Description
verbose	verbose message
io	I/O process loop
io_loop	I/O process loop verbose messages
ndmps	NDMP service
ndmpp	NDMP Protocol
rpc	General RPC service
fdc_rpc	RPC to FC driver service
auth	Authentication
mover	NDMP MOVER (tape I/O)
data	NDMP DATA (backup/restore)
scsi	NDMP SCSI (robot/tape ops)
bkup_rpc	RPC to Backup service client
bkup_rpc_s	RPC to Backup service server
cleaner	Backup/Mover session cleaner
conf	Debug configure/reconfigure
dblade	Dblade specific messages
timer	NDMP server timeout messages
vldb	VLDB service
smf	SMF Gateway messages
vol	VOL OPS service
sv	SnapVault NDMP extension
common	NDMP common state
ext	NDMP extensions messages
sm	SnapMirror NDMP extension
ndmprpc	NDMP Mhost RPC server

## Examples

The following example shows how to start logging on a specific NDMP session 33522, running on the node cluster1-01 with filter normal.

```
cluster1::*> system services ndmp log start -node cluster1-01 -session-id 33522
-filter normal
```

The following example shows how to start logging on the NDMP server session, on the node cluster1-01 with filter all.

```
cluster1::*> system services ndmp log start -session-id server -filter all -node
```

cluster1-01

# system services ndmp log stop

(DEPRECATED)-Stop logging for the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp log stop](#)" command.

This command is used to stop logging on an active NDMP session on a node. The NDMP **server** session manages all NDMP tasks on the node. If you want to stop logging information regarding the NDMP server, use **server** with the **-session-id** parameter to disable logging. If you want to stop logging information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the **-session-id** parameter to disable logging.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node.

**-session-id {<integer>|server} - Session Identifier**

This parameter specifies the NDMP session-id on which logging needs to be stopped. The session-id is associated with a unique NDMP session. Specify **server** to stop logging on the NDMP server session.

## Examples

The following example shows how to stop logging on a specific NDMP session 35512, running on node cluster1-01.

```
cluster1::*> system services ndmp log stop -session-id 35512 -node cluster1-01
```

The following example shows how to stop logging on the NDMP server session, running on node cluster1-01.

```
cluster1::*> system services ndmp log stop -session-id server -node cluster1-01
```

- [vserver services ndmp log stop](#)

# system services ndmp node-scope-mode off

(DEPRECATED)-Disable NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp``" command.

This command puts NDMP server in Vserver-aware mode. The Vserver-aware commands are available under `vserver services ndmp`.

## Examples

The following example shows how to disable the node-scope-mode of NDMP server.

```
cluster1::> system services ndmp node-scope-mode off
NDMP node-scope-mode is disabled.
```

# system services ndmp node-scope-mode on

(DEPRECATED)-Enable NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp``" command.

This command puts the NDMP server in the node-scope-mode. In the node-scope-mode, NDMP server has the following behavior:

- All NDMP operations are restricted to resources on the node
- Vserver-aware NDMP commands are disabled
- NDMP authentication falls back to DATA ONTAP 8.1 NDMP authentication scheme

## Examples

The following example enables node-scope-mode of operation :

```
cluster1::> system services ndmp node-scope-mode on
NDMP node-scope-mode is enabled.
```

# system services ndmp node-scope-mode status

(DEPRECATED)-Status of NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp``" command.

This command displays whether the NDMP server is operating in node-scope-mode or not.

- NDMP node-scope-mode is disabled - NDMP server is Vserver-aware
- NDMP node-scope-mode is enabled - NDMP server is node scoped

## Parameters

## Examples

The following example shows how to check the status of NDMP server in a cluster

```
cluster1::> system services ndmp node-scope-mode status
NDMP node-scope-mode is disabled.
```

# system services ndmp service modify

Modify NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system services ndmp service modify` command allows you to modify the NDMP service configurations for a node in the cluster. The following configuration can be modified:

- NDMP Common Sessions

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node whose NDMP configuration is to be modified.

**[-common-sessions <integer>] - NDMP Common Sessions**

This optional parameter specifies the number of extra common NDMP sessions supported, in addition to the number of backup and restore sessions supported for a platform. The default value is 4 for all platforms. The number of backup and restore sessions are platform dependent.

Increasing this parameter can make the storage system unresponsive.

## Examples

The following example modifies the NDMP configuration on a node named node1. The configuration sets the NDMP Common Sessions to 16:

```
cluster1::> system services ndmp modify -node node1
          -common-sessions 16
```

## system services ndmp service show

Display NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system services ndmp service show` command displays the following information about the NDMP service configuration across all the nodes in the cluster:

- Node name
- NDMP Common Sessions

A combination of parameters can be optionally supplied to filter the results based on specific criteria.

## Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{ [-instance ] }

If you specify the **-instance** parameter, the command displays detailed information about all fields.

{ [-node {<nodename>|local}] - Node }

Selects information about the specified node.

{ [-common-sessions <integer>] - NDMP Common Sessions }

Selects information about the nodes that have the specified number of NDMP common sessions.

## Examples

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp service show
Node          Common Sessions
-----
node0          16
node1          16
node2          16
node3          16
4 entries were displayed.
```

# system services ndmp service start

Start the NDMP service

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system services ndmp service start** command starts the NDMP service daemon for a node. This is different from the **system services ndmp on** command. The **system services ndmp on** command enables the daemon to accept NDMP requests. The NDMP service daemon starts automatically on a node when it boots up. Use this command to start the NDMP service daemon that has been stopped by the **system services ndmp service stop** command.

## Parameters

**-node {<nodename>|local} - Node**

The node on which the NDMP service needs to be started.

## Examples

```
cluster1::*> system services ndmp service start -node node0
```

Starts the NDMP service on node0.

## Related Links

- [system services ndmp on](#)
- [system services ndmp service stop](#)

# system services ndmp service stop

Stop the NDMP service

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system services ndmp service stop** command stops the NDMP service daemon on a node. This is a disruptive command and should not be used in normal scenarios. Processing of active sessions continues but the ability to view or kill sessions is lost. This is different from the [system services ndmp off](#) command. The [system services ndmp off](#) command disables new NDMP connections on the node but does not stop the NDMP service daemon.

## Parameters

**-node {<nodename>|local} - Node**

The node on which the NDMP service needs to be stopped.

## Examples

```
cluster1::*> system services ndmp service stop -node node0
```

Stops the NDMP service on node0.

## Related Links

- [system services ndmp off](#)

# system services ndmp service terminate

Terminate all NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system services ndmp service terminate` command terminates all active sessions on the node. This command forcefully terminates all NDMP sessions without an opportunity for a graceful shutdown. Use [system services ndmp kill-all](#) for a clean termination of all active sessions on a node.

## Parameters

`-node {<nodename>|local}` - Node

The node on which the NDMP sessions need to be terminated

## Examples

```
cluster1::*> system services ndmp service terminate -node node0
```

Terminates all active NDMP sessions on node0.

## Related Links

- [system services ndmp kill-all](#)

# system services web modify

Modify the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command modifies the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its scope applies to the local node.

## Parameters

### `[-external {true|false}] - External Web Services`

Defines whether remote clients can access HTTP or HTTPS service content. Along with the **system services firewall** configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is 'true', which exports web protocols for remote access. If no value is provided during modification, its behavior does not change.

### `[-per-address-limit <integer>] - Per Address Limit`

Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit. The default value is 96.

### `[-http-enabled {true|false}] - HTTP Enabled`

Defines whether HTTP is enabled. The default value for this parameter is **false** .

### `[-csrf-protection-enabled {true|false}] - CSRF Protection Enabled`

Defines whether CSRF protection is enabled. The default value is **true** .

### `[-csrf-token-concurrent-limit <integer>] - Maximum Number of Concurrent CSRF Tokens`

Defines how many concurrent CSRF tokens can exist at any given time. The default value is **500** .

### `[-csrf-token-idle-timeout <integer>] - CSRF Token Idle Timeout (Seconds)`

Defines how long (in seconds) an unused CSRF token will exist until it expires. The default value is **900** seconds (15 minutes).

### `[-csrf-token-absolute-timeout <integer>] - CSRF Token Absolute Timeout (Seconds)`

Defines how long (in seconds) a CSRF token can exist regardless of usage. The default value is **0/undefined** , which means that it will never time out.

## Examples

The following command changes the maximum size of the wait queue:

```
cluster1::> system services web modify -wait-queue-capacity 256
```

## system services web show

Display the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its output applies to the local node. The following information explains the **External Web Services** and **Status** attributes, two features of web services' availability.

The **External Web Services** field indicates whether remote clients are allowed to access the HTTP or HTTPS service content. Along with the **system services firewall** configuration, the **External Web Services** field indicates the visibility for client connections.

The **Status** field describes the aggregated operational state of cluster-level web services as retrieved from the **system services web node** command. The **Status** field does not reflect whether the protocols are externally visible, but whether the server processes are running correctly. For detailed information about individual servers, use the [system services web node show](#) command. The following are the possible values for the **Status** in node configuration or availability:

- online, all web services are consistently configured and working correctly.
- partial, one or more nodes' web services are unavailable due to an error condition.
- mixed, the nodes in the cluster do not share the same web services configuration. This situation might occur if individual nodes were reconfigured with the **system services web node** command.
- offline, all of the nodes' web services are unavailable due to an error condition.
- unclustered, the current node is not part of an active cluster.

The **HTTP Enabled** field indicates whether HTTP is enabled.

The **per-address-limit** field is the limit of the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

## Examples

The following example displays the availability of web services for the cluster.

```
cluster1::> system services web show
External Web Services: true
                    Status: online
    HTTP Protocol Port: 80
    HTTPS Protocol Port: 443
    HTTP Enabled: true
```

## Related Links

- [system services web node show](#)

# system services web node show

Display the status of the web servers at the node level

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays operational configuration for the web server processes on the nodes in the cluster. This output is aggregated to produce the content for the system services web show command.

## Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node**

Selects the nodes that match this parameter value. Identifies the node where the web server process is being executed.

**[ -external {true|false} ] - External Web Services**

Selects the nodes that match this parameter value. Defines whether remote clients can access the HTTP or HTTPS service content. Along with the **system services firewall** command configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is **true**, which exports web protocols for remote access.

**[ -http-port <integer> ] - HTTP Port**

Selects the nodes that match this parameter value. Defines the HTTP port for the node-level web services.

**[ -https-port <integer> ] - HTTPS Port**

Selects the nodes that match this parameter value. Defines the encrypted HTTP (HTTPS) port for the node-level web services.

**[ -http-enabled {true|false} ] - HTTP Enabled**

Selects the nodes that match this parameter value. Defines whether HTTP is enabled.

**[ -per-address-limit <integer> ] - Per Address Limit**

Selects the nodes that match this parameter value. Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those

in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

### **[-status {offline|partial|mixed|online|unclustered}] - Protocol Status**

Selects the nodes that match this parameter value. Describes the operational state of node-level web services. This parameter does not reflect whether protocols are externally visible, but whether the server processes are running correctly. The following are the possible values that describe the service availability:

- online, indicates that web services are working correctly.
- offline, indicates that web services are unavailable due to an error condition.
- unclustered, indicates that the current node is not part of an active cluster.

### **[-total-hits <integer>] - Total HTTP Requests**

Selects the nodes that match this parameter value. Indicates the total number of requests serviced by the web server.

### **[-total-bytes <integer>] - Total Bytes Served**

Selects the nodes that match this parameter value. Indicates the total number of bytes returned by the web server.

## Examples

The following example displays the status of web servers for nodes in the cluster.

```
cluster1::system services web node> show
Node          External HTTP  HTTP  HTTPS  Status  Total  Total
              enabled Port  Port   Status HTTP Requests Bytes Served
-----
node1         true   true   80    443   online    5      1362
node2         true   true   80    443   online    5      1362
2 entries were displayed.
```

- [system services web show](#)

# system smtape abort

Abort an active SMTape session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command aborts the backup or restore operations based on the session identifier. You can perform SMTape operations using the [system smtape backup](#) or [system smtape restore](#) commands. A unique session identifier is assigned for each new SMTape operation. This command aborts sessions that are in active and waiting states.

## Parameters

**-session <Sequence Number> - Session Identifier**

Use this parameter to specify the session identifier for a backup or restore session.

## Examples

Abort the SMTape session with the session identifier **20**

```
cluster1::> system smtape abort -session 20
Abort posted to session 20.
```

# system smtape backup

Backup a volume to tape devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command performs a baseline backup of a specified volume path to a tape device. You can use the command **system hardware tape drive show** to view the list of tape devices in the cluster. You must specify a Snapshot copy name to perform an SMTape backup operation. The Snapshot copy name specified is used as the base Snapshot copy. A new unique session ID is assigned for this SMTape operation and the status of the session can be monitored using the command **system smtape status** . This session ID can be subsequently used to perform other operations such as to find the SMTape status, abort an SMTape operation, and continue an SMTape operation.

The volume and tape device must reside on the same node in the cluster. You must retain the base Snapshot copy created during this backup operation in order to use this Snapshot copy to re-establish a SnapMirror relationship upon a restore.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

### **-volume <volume name> - Volume Name**

Use this parameter to specify the name of the volume that needs to be backed up to tape.

### **-backup-snapshot <snapshot name> - Snapshot Name**

Use this parameter to specify the name of the Snapshot copy while performing an SMTape backup operation.

### **-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

### **[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

## Examples

The following example will start the backup of a volume **datavol** in a Vserver **vserver0** to a tape **rst0a**. Both the volume and tape reside on the same node **cluster1-01**. The Snapshot copy to be backed up is **datavol\_snapshot** and the tape record size has the value of 256KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
  -backup-snapshot datavol_snapshot -tape /cluster1-01/rst0a
  -tape-block-size 256
```

```
Session 21 created successfully
```

The following example will start the backup of a volume **datavol** in a Vserver **vserver0** to a tape **rst0a**. The volume **datavol** is in a Vserver **vserver0**. Both the volume and tape reside on the same node **cluster1-01**. The Snapshot copy to be backed up is **datavol\_snapshot** and the tape record size has the default value of 240KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
  -backup-snapshot datavol_snapshot -tape /cluster1-01/nrst0l
Session 22 created successfully
```

# system smtape break

Make a restored volume read-write

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.

## Parameters

**-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

**-volume <volume name> - Volume Name**

Use this parameter to specify the name of the read-only volume that needs to be made read/writeable after a restore.

## Examples

Make the read-only volume **datavol** on Vserver **vserver0** writeable after a restore.

```
cluster1::> system smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

# system smtape continue

Continue SMTape session waiting at the end of tape

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continues the SMTape backup and restore operations using the specified tape device. You can use this command when an SMTape operation has reached the end of current tape and is in the wait state to write to or read from a new tape.

If a tape device is not specified, the original tape device will be used.

User has to make sure that the correct tape media is inserted in the device and positioned

appropriately before issuing this command.

## Parameters

### **[-tape </node\_name/tape\_device>] - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

### **-session <Sequence Number> - Session Identifier**

Use this parameter to specify the session identifier for the SMTape backup or restore operations.

## Examples

Continues an SMTape session having session ID **20** on tape device **rst0a** on the node **node1** in the cluster.

```
cluster1::> system smtape continue -session 20 -tape /node1/rst0a
continue on session 20 succeeded
```

The following example continues session **40** on the same tape device that was being used by the session.

```
cluster1::> system smtape continue -session 40
continue on session 40 succeeded
```

## system smtape restore

Restore a volume from tape devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command performs restore of a backup image created using the command `system smtape backup` in the specified tape device to a destination volume path. A new unique session ID is assigned for this operation; the status of the session can be monitored using the command `system smtape status`. It is required that the volume and tape device reside in the same cluster node. The volume must be of type DP (Data Protection) and should be placed in the restricted mode prior to a restore.

Any existing data on the volume will get overwritten upon a restore. The volume will remain as read-only and of type DP after the restore. You can use the command `system smtape break` to get read/write permissions on the volume. Restore can be done to a non-root DP volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

### **-volume <volume name> - Volume Name**

Use this parameter to specify the volume name on which the tape content will be restored.

### **-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

### **[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified. Use the same record size which was used during the backup. If the tape record size is different from the tape record size that was used at the time of backup then `system smtape restore` will fail.

## Examples

The following example will start the restore to a volume `datavol` from a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both `vserver0` and `rst0a` reside on the same node `cluster1-01`.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol
           -tape /cluster1-01/rst0a -tape-block-size 256
Session 2 created successfully
```

The following example will start the restore to a volume `datavol` from a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both `vserver0` and `rst0a` reside on the same node `cluster1-01`. The default tape record size of 240KB was used during backup.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol
           -tape /cluster1-01/rst0a
Session 5 created successfully
```

## Related Links

- [system smtape backup](#)
- [system smtape break](#)

# system smtape showheader

Display SMTape header

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the image header of a tape. The tape must have a valid backup of data. The following information about the backup is displayed:

- Tape Number - the tape number if the backup spans multiple tape devices.
- WAFL Version - WAFL version of the storage system when the volume was backed up on tape.
- Backup Set ID - a unique backup set ID for the baseline backup.
- Source Storage System - the source storage system where the volume resided when the backup was performed.
- Source Volume - the source volume that was backed up to tape.
- Source Volume Capacity - the capacity of the source volume that was backed up to tape.
- Source Volume Used Size - the used size of the source volume that was backed up to tape.
- Source Snapshot - name of the Snapshot copy used for the backup.
- Volume Type - type of the volume.
- Is SIS Volume - this field is true if the backed up volume was a SIS volume.
- Backup Version - the SMTape backup version.
- Backup Sequence No - the backup sequence number.
- Backup Mode - this field describes the backup mode.
- Time of Backup - the time at which the backup was performed.
- Time of Previous Backup - the time at which the previous backup was performed; this information is displayed only if the previous backup was an incremental backup.
- Volume Total Inodes - number of inodes of the backed up volume.
- Volume Used Inodes - number of used inodes of the backed up volume.
- Number of Snapshots - number of Snapshot copies present in this backup.
- Snapshot ID - is the Snapshot ID of the backup Snapshot.
- Snapshot Time - time at which the backup Snapshot copy was created.
- Snapshot Name - name of the Snapshot copy which was backed up to tape.

## Parameters

**-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

**[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

## Examples

The following example reads the image header from the tape `nrst01` residing on the node `cluster1-01` and displays relevant tape header information.

```
cluster1::> system smtape showheader -tape /cluster1-01/nrst01
-tape-block-size 240
Tape record size in KB: 240
  Tape Number: 1
    WAFL Version: 23577
      Backup Set ID: 7d0c9a15-8e20-11e1-8741-123478563412
        Source Storage System: cluster1-01
          Source Volume: /vs1/srcvol
            Source Volume Capacity: 400.00MB
              Source Volume Used Size: 0.00
                Source Snapshot: mysnap
                  Volume Type: Flex
                    Is SISVolume: no
                      Backup Version: 1:3
                        Backup Sequence No: 0
                          Backup Mode: dw-data
                            Time of Backup: 4/24/2012 15:16:38
                              Time of Previous Backup: 0/0/0 00:00:00
                                Volume Total Inodes: 12789
                                  Volume Used Inodes: 100
                                    Number of Snapshots: 1
                                      Snapshot ID: 1
                                        Snapshot Time: 4/24/2012 15:16:10
                                          Snapshot Name: mysnap
```

## system smtape status clear

Clear SMTape sessions

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

## Description

This command clears SMTape sessions which are completed, failed or Unknown state.

## Parameters

### **[-session <Sequence Number>] - Session Identifier**

Use this parameter to clear the SMTape sessions with the specified session identifier.

### **[-node {<nodename>|local}] - Node Name**

Use this parameter to clear the SMTape sessions related to the specified node.

### **[-type {backup|restore}] - Operation Type**

Use this parameter to clear the SMTape sessions of the specified operation type. These can be either backup or restore sessions.

### **[-status {COMPLETED|FAILED|UNKNOWN}] - Session Status**

Use this parameter to clear the SMTape sessions which have the status as specified in the parameter.

### **[-path <text>] - Path Name**

Use this parameter to clear the SMTape sessions which have path as specified in the parameter.

### **[-device <text>] - Device Name**

Use this parameter to clear the SMTape sessions on a specific tape device.

### **[-backup-snapshot <snapshot name>] - Snapshot Name**

Use this parameter to clear the SMTape sessions using the Snapshot copy name as specified in the parameter.

### **[-tape-block-size <integer>] - Tape Block Size**

Use this parameter to clear the SMTape sessions with the tape block size as specified in the parameter.

## Examples

The following example clears all the completed SMTape sessions in the cluster:

```
cluster1::> system smtape status clear
5 sessions are purged.
```

The SMTape sessions on the node **node1** in the cluster are cleared.

```
cluster1::> system smtape status clear -node node1
3 sessions are purged.
```

# system smtape status show

Show status of SMTape sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command lists the status of all SMTape sessions in the cluster. By default, this command lists the following information:

- Session
- Type
- Status
- Progress
- Path
- Device
- Node

## Parameters

{ [-fields <fieldname>,...]

Use this parameter to display additional fields about each session apart from the default entries. This parameter is optional. Any combination of the following fields is valid:

- Session
- Node
- Type
- Status
- Path
- Device
- Progress
- Start-time
- End-time
- Update-time
- Backup-snapshot
- Tape-block-size
- Error

**[ -instance ] }**

Displays detailed information about the specified sessions.

**[ -session <Sequence Number> ] - Session Identifier**

Selects information about a specific SMTape session. A Session Identifier is a number that is used to identify a particular SMTape session.

**[ -node {<nodename>|local} ] - Node Name**

Selects information about sessions related to the specified node.

**[ -type {backup|restore} ] - Operation Type**

Selects information about SMTape sessions of the specified operation type.

**[ -status {COMPLETED|FAILED|ACTIVE|WAITING|ABORTING|UNKNOWN} ] - Session Status**

Selects information about SMTape sessions having the specified status in the parameter.

**[ -path <text> ] - Path Name**

Selects information about SMTape sessions on a volume which is at the specified path name. This is the logical path of the volume and you must specify the path name in the following format: `/vserver_name /volume_name` .

**[ -device <text> ] - Device Name**

Selects information about the SMTape sessions on the specified tape device. You must specify the tape device name in the following format: `/node_name /tape_device` .

**[ -progress {<integer>[KB|MB|GB|TB|PB]} ] - Bytes Transferred**

Selects information about SMTape sessions in which the number of data bytes transferred in a particular session matches with the number specified in this parameter.

**[ -start-time <MM/DD/YYYY HH:MM:SS> ] - Start Time**

Selects information about SMTape sessions whose starting time matches the specified starting time.

**[ -end-time <MM/DD/YYYY HH:MM:SS> ] - End Time**

Selects information about SMTape sessions whose ending time matches the specified ending time.

**[ -backup-snapshot <snapshot name> ] - Snapshot Name**

Selects information about SMTape sessions that use a particular Snapshot copy name which matches the specified Snapshot copy name in the parameter in backup or restore operations.

**[ -tape-block-size <integer> ] - Tape Block Size**

Selects information about SMTape sessions that use a particular tape block size which matches the specified tape block size parameter in backup or restore operations.

**[ -error <text> ] - Error Description**

Selects information about SMTape sessions that have a particular error description which matches

the specified error description in the parameter.

## Examples

Displays default entries about the five SMTape sessions.

```
cluster1::> system smtape status show
```

Session	Type	Status	Progress	Path	Device	Node
5	Backup	COMPLETED	50MB	/vsrvr1/vol1	/cls1-01/nrst01	cluster1-01
4	Restore	FAILED	0B	/vsrvr1/vol3	/cls1-02/nrst21	cluster1-02
3	Backup	COMPLETED	50MB	/vsrvr1/vol3	/cls1-01/nrst01	cluster1-01
2	Backup	COMPLETED	50MB	/vsrvr1/vol2	/cls1-03/nrst0m	cluster1-03
1	Backup	COMPLETED	50KB	/vsrvr1/vol5	/cls1-01/nrst0n	cluster1-01

5 entries were displayed.

The following example shows the output with the **-instance** argument.

```
cluster1::> system smtape status show -instance
```

```
Session Identifier: 1
  Node Name: node1
  Operation Type: Backup
    Status: COMPLETED
    Path Name: /vs1/vol1
    Device Name: /node1/rst0a
  Bytes Transferred: 2048
    Start Time: 1/4/2012 14:26:24
    End Time: 1/4/2012 14:29:45
    Last updated: 1/4/2012 14:29:45
  Snapshot Name: vol1.snapshot
  Tape Block Size: 240
  Error Description: None
```

## system snmp authtrap

Enables or disables SNMP authentication traps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Use this command to either enable or disable the standard SNMP authentication failure traps.

## Parameters

### **[-authtrap <integer>] - Enables SNMP Authentication Trap**

Enter the value of 1 to enable SNMP authentication failure traps. By default, SNMP authentication trap is disabled and the value is 0.

## Examples

The following example demonstrates how to set the SNMP authtrap. +

```
cluster1::> system snmp authtrap -authtrap 1
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    0
traphosts:
    -
community:
    - -
```

## system snmp contact

Displays or modifies contact details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Sets the contact name as the System.sysContact.0 MIB-II variable.

## Parameters

### **[-contact <text>] - Contact**

Specifies the contact name. Without any value specified, this command displays current setting of contact name.

## Examples

The following example sets the contact name for SNMP. +

```
cluster1::> system snmp contact -contact private
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    0
traphosts:
    -
community:
    - -
```

## system snmp enable-snmpv3

Enables SNMPv3 cluster-wide

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system snmp enable-snmpv3` command enables SNMPv3 server on the entire cluster. When this command is run, SNMP users and SNMP traphosts that are non-compliant to FIPS will be deleted automatically, since cluster FIPS mode is enabled. Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.

### Examples

The following command enables SNMPv3 server on the entire cluster, within a cluster named `cluster1`:

```
cluster1::> set -privilege advanced

Warning: These advanced commands are potentially dangerous; use them only when
        directed to do so by Fujitsu personnel.
Do you want to continue? {y|n}: y

cluster1::*> system snmp enable-snmpv3

Warning: If you enable SNMPv3 using this command, any SNMP users and
        SNMP traphosts that are non-compliant to FIPS will be
        deleted automatically, since cluster FIPS mode is enabled.
```

```
Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.
```

```
Do you want to continue? {y|n}: y
```

```
1 entry was modified.
```

```
cluster1::~*>
```

## system snmp init

Enables or disables SNMP traps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Initializes or disables sending of traps by the SNMP daemon from the cluster.

### Parameters

#### **[-init <integer>] - Initialize Traps**

Use the value of 1 to initialize SNMP daemon to send traps or use a value of 0 to stop sending traps from the cluster. If no value is specified, this command displays the current setting of init. Traps are enabled by default.

### Examples

The following command initializes SNMP daemon to send traps. +

```
cluster1::> system snmp init -init 1
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    -
community:
```

- -

## system snmp location

Displays or modifies location information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Sets the location name as the System.sysLocation.0 MIB-II variable.

### Parameters

**[-location <text>] - Location**

Specifies the location details. If no value is specified, this command displays the current setting of location.

### Examples

This command sets the location name. +

```
cluster1::> system snmp location -location NB
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    -
community:
    - -
```

## system snmp prepare-to-downgrade

Change SNMP configuration to the default settings for releases earlier than Data ONTAP 9.3.0

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system snmp prepare-to-downgrade` command prepares the SNMP subsystem for a downgrade or a revert. More specifically, it prepares the SNMPv3 client feature for a downgrade or a revert. It deletes all storage switches that were explicitly added for monitoring and are using SNMPv3 as the underlying protocol. It also deletes any cluster switches that are using SNMPv3 for monitoring. Finally, it deletes any remote switch SNMPv3 users configured in ONTAP.

## Examples

The following command prepares the SNMP subsystem for a downgrade or a revert, within a cluster named `cluster1`:

```
cluster1::*> system snmp prepare-to-downgrade
```

## system snmp show

Displays SNMP settings

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Lists the current values of all the SNMP parameters.

## Examples

The example below shows a typical command display.

```
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    xxx.example.com(192.168.xxx.xxx)
community:
    - -
```

# system snmp community add

Adds a new community with the specified access control type

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system snmp community add** command adds communities with the specified access control type. Only read-only communities are supported. There is no limit for the number of communities supported.

## Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver to which the community will be added. If no Vserver is specified, the community is added to the admin Vserver.

**-community-name <text> - Community**

This parameter specifies the name of the community.

**-type <ctype> - access type**

This parameter specifies 'ro' for read-only community.

## Examples

The following example adds the read-only community name 'private'.

```
cluster1::> system snmp community add -type ro
             -community-name private
cluster1::> system snmp community show
             ro private
```

# system snmp community delete

Deletes community with the specified access control type

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system snmp community delete** command deletes communities with the specified access control type. Only read-only communities are supported.

## Parameters

### **-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver from which you wish to delete the community. If no Vserver is specified, the community is deleted from the admin Vserver.

### **-community-name <text> - Community**

Specify the name of the community.

### **-type <ctype> - access type**

Specify 'ro' for a read-only community.

## Examples

The following example deletes the read-only community 'private':

```
cluster1::> system snmp community delete -type ro
             -community-name private
cluster1::> system snmp community show
This table is currently empty.
```

## system snmp community show

Displays communities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Displays the current list of SNMP communities.

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

### **[-vserver <Vserver Name>] - Vserver**

Selects the Vserver to which the SNMP community belongs

**[-community-name <text>] - Community**

Selects the SNMP v1/v2c community string

**[-access <ctype>] - access**

Selects the access type of the SNMP v1/v2c community. Read-only (ro) is the only access type supported

## Examples

```
cluster1::> system snmp community show
cluster1
  ro private
```

# system snmp traphost add

Add a new traphost

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Adds the SNMP manager who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

## Parameters

**-peer-address <Remote InetAddress> - Remote IP Address**

Specifies the IP address or hostname of the traphost. If the USM user is associated, then the SNMPv3 traps are generated for this traphost using the associated USM user's authentication and privacy credentials. If no USM user is associated, then the SNMP v1/v2c traps are generated for this traphost. For the SNMP v1/v2c traps, the default community string is 'public', when no community is defined. When the community strings are defined, then the first community string is chosen for the SNMP v1/v2c traps.

**[-usm-username <text>] - USM User Name**

Specifies a predefined SNMPv3 USM user. The SNMPv3 traps are generated using this USM user's authentication and privacy credentials for the traphost identified by the peer-address parameter.

## Examples

In the following example, the command adds a hostname 'yyy.example.com' for the SNMPv3 traps: +

```
cluster1::> system snmp traphost add -peer-address yyy.example.com -usm-username
MyUsmUser
```

```
cluster1::> system snmp traphost show
                yyy.example.com(yyy.example.com)(192.168.xxx.xxx)    USM User:
MyUsmUser
```

In the following example, the command adds a hostname 'xxx.example.com' for the SNMP v1/v2c traps: +

```
cluster1::> system snmp traphost add xxx.example.com
cluster1::> system snmp traphost show
                yyy.example.com(yyy.example.com)(192.168.xxx.xxx)    USM User:
MyUsmUser
                xxx.example.com(xxx.example.com)(xxx.xxx.xxx.xxx)    Community:
public
```

## system snmp traphost delete

Delete a traphost

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Deletes the SNMP manager, who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

### Parameters

**-peer-address <Remote InetAddress> - Remote IP Address**

Specifies the IP address or hostname of the traphost. If the USM user is associated, then specify the USM user to delete the traphost.

**[-usm-username <text>] - USM User Name**

Specifies the USM user associated with traphost.

### Examples

In the following example, the command deletes the SNMPv3 traphost 'yyy.example.com' associated with the USM user: +

```
cluster1::> system snmp traphost delete -peer-address yyy.example.com -usm-username
MyUsmUser
```

In the following example, the command deletes the SNMP v1/v2c traphost 'xxx.example.com' associated with a community string: +

```
cluster1::> system snmp traphost delete -peer-address xxx.example.com
```

## system snmp traphost show

Displays traphosts

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays list of the SNMP v1/v2c and SNMP v3 managers, that receive trap PDUs.

### Examples

In the following example, the command displays all the host names or IP addresses that have been added until now: +

```
cluster1::> system snmp traphost show
MyUsmUser          yyy.example.com(yyy.example.com)(192.168.xxx.xxx)   USM User:
                  xxx.example.com(xxx.example.com)(xxx.xxx.xxx.xxx)   Community: public
```

## system status show

Display System Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system status show** command displays information about the status of objects in Data ONTAP. You can limit output to specific types of information and specific status in Data ONTAP, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the **-fields** parameter of this command with the list of field names you wish to view.

### Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-internal-name <text>`] - Internal Full Name**

Selects status of objects that match this parameter value.

**[`-name <text>`] - Name**

Selects status of objects that match this parameter value.

**[`-vserver-id <text>`] - Vserver ID**

Selects status of objects that match this parameter value.

**[`-cluster-id <text>`] - Cluster ID**

Selects status of objects that match this parameter value.

**[`-is-cluster-scope {true|false}`] - Cluster Scope**

Selects status of objects that match this parameter value.

**[`-status <text>`] - Status Value**

Use this parameter to display the status.

**[`-update-time <MM/DD/YYYY HH:MM:SS>`] - Update Time**

Use this parameter to display the status last update time.

## Examples

The following example displays information about system status in ONTAP:

```
cluster1::> system status show
Cluster:tfarrellnscluster-1
Node:tfarrell-vs1m1
Hypervisor system name:vsimesxrtp060.gdl.englab.netapp.com

```

# system switch ethernet configure-health-monitor

Ethernet switch health monitor configuration file setup.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system switch ethernet configure-health-monitor** command downloads an Ethernet switch's health monitor configuration file in the ZIP format, which contains the XML file and a signed version file. After download, ONTAP will check the signed file. If valid, the Ethernet switch health monitor restarts to use the new Ethernet switch health monitor configuration file.

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node or nodes on which the Ethernet switch health monitor configuration file is to be updated.

**-package-url <text> - Package URL**

This parameter specifies the URL that provides the location of the package to be downloaded. Standard URL schemes, including HTTP, HTTPS, FTP and FILE, are accepted.

## Examples

The following example downloads Ethernet switch health monitor configuration file to node1 from a web server and enables Ethernet switch health monitor to process it:

```
cluster1::*> system switch ethernet configure-health-monitor -node node1 -package-url
http://example.com/hm_config.zip
```

# system switch ethernet create

Add information about an Ethernet switch (cluster, management or storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet create** command adds information about an Ethernet switch (cluster, management or storage). The Ethernet switch health monitor uses this information to monitor the health of the switch.

Use this command if ONTAP cannot automatically discover a cluster, management or storage switch. ONTAP relies on the Cisco Discovery Protocol (CDP) to discover the switches. CDP is always enabled on all cluster ports of a node by default, disabled on all non-cluster ports of a node. If the CDP is also enabled on your Ethernet switches, they will be automatically discovered.

If you want ONTAP to discover and monitor management switches, the CDP must be enabled on non-cluster ports. To verify whether the CDP is enabled or disabled, use the command `system node run -node [HTML_REMOVED]node_name[HTML_REMOVED]-command options cdpd.enable .`

Use the `system switch ethernet show` command to identify switches that the Ethernet switch health monitor is monitoring.

## Parameters

### `-device <text>` - Device Name

Specifies the device name of the switch that you want to monitor. ONTAP uses the device name of the switch to identify the SNMP agent with which it wants to communicate.

### `-address <IP Address>` - IP Address

Specifies the IP address of switch's management interface.

### `-snmp-version {SNMPv1|SNMPv2c|SNMPv3}` - SNMP Version

Specifies the SNMP version that ONTAP uses to communicate with the switch. The default is SNMPv2c.

### `{ -community <text> - DEPRECATED-Community String or SNMPv3 Username`

This parameter is deprecated and may be removed in a future release of ONTAP. Use `-community-or-username` instead.

Specifies the community string for SNMPv2 authentication or SNMPv3 user name for SNMPv3 security. The default community string for SNMPv2 authentication is cshm1!.

### `| -community-or-username <text> - Community String or SNMPv3 Username }`

Specifies the community string for SNMPv2 authentication or SNMPv3 user name for SNMPv3 security. The default community string for SNMPv2 authentication is cshm1!.

### `-model`

`{NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|NX5548|NX3132V|OT9332|NX3132XL|NX3232C}` - Model Number

This parameter specifies the model number of the switch. Use "OTHER" model when adding a switch that requires a switch health monitor XML configuration file, for example: BES-53248 and N9K-C92300YC switches. ONTAP also sets the model to OTHER when it automatically discovers a switch that does not support health monitoring.

### `-type {cluster-network|management-network|storage-network}` - Switch Network

Specifies the switch type.

**[-is-monitoring-enabled-admin {true|false}] - Enable Switch Monitoring**

Specifies the switch admin monitoring status.

## Examples

```
cluster1::> system switch ethernet create -device SwitchA -address 1.2.3.4 -snmp
-version SNMPv2c -community-or-username cshm1! -model NX55596 -type cluster-network
```

Creates a new switch configuration for a switch named SwitchA.

```
cluster2::> system switch ethernet create -device SwitchB -address 5.6.7.8 -snmp
-version SNMPv3 -community-or-username snmpv3u1 -model CN1601 -type management-network
```

Creates a new switch configuration for a switch named SwitchB.

## Related Links

- [system node run](#)
- [system switch ethernet show](#)

# system switch ethernet delete

Delete information about an Ethernet switch (cluster, management or storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet delete** command disables switch health monitoring for an Ethernet switch (cluster, management or storage).

## Parameters

**-device <text> - Device Name**

Specifies the name of the switch.

**[-force <>true>] - Force Delete**

Specifies if the delete operation is forced.

## Examples

```
cluster1::> system switch ethernet delete -device SwitchA
```

Disables monitoring for the switch named SwitchA.

```
cluster1::> system switch ethernet delete -device SwitchA -force
```

Forcefully disables monitoring for the switch named SwitchA. (privilege: advanced)

## system switch ethernet modify

Modify information about an Ethernet switch's configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system switch ethernet modify` command modifies information about an Ethernet switch (cluster, management or storage). The Ethernet switch health monitor uses this information to monitor the switch.

### Parameters

**-device <text> - Device Name**

Specifies the device name of switch that you want to monitor.

**[-address <IP Address>] - IP Address**

Specifies the IP address of the switch's management interface.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

Specifies the SNMP version that ONTAP uses to communicate with the switch. The default is SNMPv2c.

**{ [-community <text>] - DEPRECATED-Community String or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of ONTAP. Use `-community-or-username` instead.

Specifies the community string for SNMPv2 authentication or SNMPv3 username for SNMPv3 security.

**[ [-community-or-username <text>] - Community String or SNMPv3 Username }**

Specifies the community string for SNMPv2 authentication or SNMPv3 username for SNMPv3 security.

**[-type {cluster-network|management-network|storage-network}] - Switch Network**

Specifies the switch type.

**[-is-monitoring-enabled-admin {true|false}] - Enable Switch Monitoring**

Specifies the switch admin monitoring status.

## Examples

```
cluster1::> system switch ethernet modify -device SwitchA -address 2.3.4.5
```

Modifies the IP address for the switch named SwitchA.

```
cluster1::> system switch ethernet modify -device SwitchB -snmp-version SNMPv3  
-community-or-username snmpv3u1
```

Modifies the SNMP parameters for the switch named SwitchB.

## system switch ethernet show-all

Displays the list of switches that were added and deleted

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system switch ethernet show-all** command displays configuration details for discovered monitored Ethernet switches (cluster, management and storage), including switches that are user-deleted. From the list of deleted switches, you can delete a switch permanently from the database to re-enable automatic discovery of that switch.

## Parameters

**{ [-fields <fieldname>, ... ] }**

Selects the fields that have the specified name.

**[ [-instance ] ] }**

Selects detailed information for all the switches.

**[-device <text>] - Device Name**

Selects the switches that match the specified device name.

**[-address <IP Address>] - IP Address**

Selects the switches that match the specified IP address.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

Selects the switches that match the specified SNMP version.

**[-community <text>] - DEPRECATED-Community String or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of ONTAP. Use **-community-or-username** instead.

Selects the switches that match the specified community string or SNMPv3 username.

**[-community-or-username <text>] - Community String or SNMPv3 Username**

Selects the switches that match the specified community string or SNMPv3 username.

**[-discovered {true|false}] - Is Discovered**

Selects the switches that match the specified discovery setting.

**[-type {cluster-network|management-network|storage-network}] - Switch Network**

Selects the switches that match the specified switch type.

**[-sw-version <text>] - Software Version**

Selects the switches that match the specified software version.

**[-is-monitoring-enabled-operational {true|false}] - Switch Monitoring Status**

Selects the switches that match the specified operational monitoring status.

**[-reason <text>] - Reason For Not Monitoring**

Selects the switches that match the specified reason.

**[-version-source <text>] - Source Of Switch Version**

Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

**[-rcf-version <text>] - Reference Config File Version**

Selects the switches that match the specified reference configuration file version.

**[-serial-number <text>] - Serial Number of the Device**

Selects the switches that match the specified serial number.

**[-model <text>] - Model to display**

Selects the switches that match the specified model number.

## Examples

```
cluster1::> system switch ethernet show-all
Switch                Type                Address             Model
-----
SwitchA               cluster             1.2.3.4            Nexus5010
```

```
Is Monitored: yes
Reason:
Software Version: Cisco IOS 4.1N1
Version Source: CDP
```

The example above displays the configuration of all Ethernet switches (cluster, management and storage).

## system switch ethernet show

Display the configuration for Ethernet switches (cluster, management and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system switch ethernet show** command displays configuration details for the monitored Ethernet switches (cluster, management and storage).

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that have the specified name.

**| [-banner ]**

Displays the following information about a switch:

- Device Name
- Banner seen when accessing the switch through SSH.

**| [-snmp-config ]**

Displays the following information about a switch:

- Device Name
- SNMPv2c Community String or SNMPv3 Username
- SNMP Version

**| [-status ]**

Displays the following status information about a switch:

- Is Discovered
- SNMPv2c Community String or SNMPv3 Username
- Model Number
- Switch Network

- Software Version
- Reason For Not Monitoring
- Source Of Switch Version
- Is Monitored ?

**[ -instance ] }**

Selects detailed information for all the switches.

**[ -device <text> ] - Device Name**

Selects the switches that match the specified device name.

**[ -address <IP Address> ] - IP Address**

Selects the switches that match the specified IP address.

**[ -snmp-version {SNMPv1|SNMPv2c|SNMPv3} ] - SNMP Version**

Selects the switches that match the specified SNMP version.

**[ -is-discovered {true|false} ] - Is Discovered**

Selects the switches that match the specified discovery setting.

**[ -community <text> ] - DEPRECATED-Community String or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of ONTAP. Use **-community-or-username** instead.

Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

**[ -community-or-username <text> ] - Community String or SNMPv3 Username**

Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

**[ -model**

**{NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|NX5548|NX3132V|OT9332|NX3132XL|NX3232C  
}] - Model Number**

Selects the switches that match the specified model number.

**[ -type {cluster-network|management-network|storage-network} ] - Switch Network**

Selects the switches that match the specified switch type.

**[ -sw-version <text> ] - Software Version**

Selects the switches that match the specified software version.

**[ -reason <text> ] - Reason For Not Monitoring**

Selects the switches that match the specified reason.

**[ -version-source <text> ] - Source Of Switch Version**

Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

**[-is-monitoring-enabled-admin {true|false}] - Enable Switch Monitoring**

Selects the switches that match the specified admin monitoring status.

**[-is-monitoring-enabled-operational {true|false}] - Is Monitored ?**

Selects the switches that match the specified operational monitoring status.

**[-serial-number <text>] - Serial Number of the Device**

Selects the switches that match the specified serial number.

**[-device-banner <text>] - Device Banner**

Banner seen when accessing the switch through SSH.

## Examples

```
cluster1::> system switch ethernet show
Switch                Type                Address             Model
-----

  Is Monitored: true
  Reason:
  Software Version: 1.1.0.1
  Version Source: ISDP
```

The example above displays the configuration of all Ethernet switches (cluster, management and storage).

```
cluster1::> system switch ethernet show -snmp-config
SNMPv2c Community
```

system switch ethernet fan show

Switch	or SNMPv3 Username	SNMP Version
SwitchA	public	SNMPv2c

The example above displays the SNMPv2c community string or SNMPv3 username and SNMP version for all Ethernet switches (cluster, management and storage).

```
cluster1::> system switch ethernet show -banner
Device: SwitchA
-----
*****
*
* NetApp Reference Configuration File (RCF)
* Switch      : SwitchModel
* Filename    : SwitchType-RCF-v1.8-Cluster
* Release Date : Apr-04-2022
* Version     : v1.8
*
*****
```

The example above shows the SSH banner for all the Ethernet switches (cluster, management, and storage).

## system switch ethernet fan show

Display fan information for Ethernet switches (cluster, management and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet fan show** command displays the status of fans on the monitored Ethernet switches.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the specified fields.

**l [-instance ]}**

Displays detailed information for all fans on all switches.

**[-device <text>] - Switch Name**

Selects the fans that belong to the specified switch.

**[-fan-name <text>] - Fan or Fan Tray Name**

Selects the fans that match the specified fan name or fan tray name.

**[-index <integer>] - Sensor Index**

Selects the fans that match the specified sensor index.

**[-fan-type {single|tray}] - Single Fan or Fan Tray**

Selects the fans that match the specified fan type.

**[-fan-status {operational|failed|not-operational|not-present|unknown}] - Fan Status**

Selects the fans that match the specified operational status.

**[-display-name <text>] - Fan Display Name**

Selects the fans that match the specified display name.

**[-unique-name <text>] - Fan Unique Name**

Selects the fan that matches the specified unique name.

**[-container-name <text>] - Fan Container Name**

Selects the fans that match the specified container name.

**[-is-psu-fan {yes|no}] - Is Power Supply Unit Fan**

Selects the fans that are PSU fans (**yes**) or are not PSU fans (**no**).

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor**

Selects the fans that the specified health monitor continuously monitors.

**[-error-description <text>] - Error Description**

Selects the fans that match the specified error description.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Resource Status**

Selects the fans that match the specified status.

## Examples

```
cluster1::> system switch ethernet fan show
```

```
Switch: SwitchA
```

Fan	Type	Fan Status	Container	Is PSU	
				Fan	Error
Fan Module-1	tray	operational	FanBay-1	no	
Fan Module-2	tray	operational	FanBay-2	no	

```
Switch: SwitchB
```

Fan	Type	Fan Status	Container	Is PSU	
				Fan	Error
Fan Module-1	tray	operational	FanBay-1	no	
Fan Module-2	tray	operational	FanBay-2	no	

The above example displays the fans and their status on the switches names SwitchA and SwitchB.

## system switch ethernet interface show

Display interface information for Ethernet switches (cluster, management and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system switch ethernet interface show** command displays the status and configuration of network interfaces on the monitored switches.

### Parameters

**{ [-fields <fieldname>, ... ] }**

Selects the fields that you specify.

**[ [-counters ] ]**

Displays the current status of the following network counters:

- in-octets
- in-errors
- in-discards
- out-octets
- out-errors
- out-discards

**[ [-instance ] ] }**

Displays detailed interface configuration for all monitored Ethernet switches

**[-device <text>] - Switch Name**

Selects the interface ports that belong to the specified switch.

**[-interface-name <text>] - Interface Name**

Selects the interface ports that match the specified interface name.

**[-index <integer>] - Interface Index**

Selects the interface ports that match the specified interface index.

**[-type <interface type>] - Interface Type**

Selects the interface ports that match the specified interface type.

**[-mtu <integer>] - MTU**

Selects the interface ports that match the specified maximum transfer unit.

**[-duplex-type {unknown|half-duplex|full-duplex}] - Duplex Settings**

Selects the interface ports that match the specified duplex setting.

**[-speed <integer>] - Interface Speed(Mbps)**

Selects the interface ports that match the specified interface speed in bits per second.

**[-admin-state {up|down|testing}] - Administrative Status**

Selects the interface ports that match the specified administrative status of the switch interface.

**[-oper-state {up|down|testing|unknown|dormant|not-present|lower-layer-down}] - Operational Status**

Selects the interface ports that match the specified operational status.

**[-is-is1 {yes|no}] - Is ISL**

Selects the interface ports that are Inter-Switch links (yes) or are not Inter-Switch links (no).

**[-in-octets <Counter>] - Input Octets**

Selects the interface ports that match the specified number of octets entering the interface.

**[-in-errors <Counter>] - Input Errors**

Selects the interface ports that match the specified number of input packets that were dropped due to errors.

**[-in-discards <Counter>] - Input Discards**

Selects the interface ports that match the specified number of input packets that were silently discarded (possibly due to buffer overflow).

**[-out-octets <Counter>] - Output Octets**

Selects the interface ports that match the specified number of octets that exited the interface.

**[-out-errors <Counter>] - Output Errors**

Selects the interface ports that match the specified number of output packets that were dropped due to errors.

**[-out-discards <Counter>] - Output Discards**

Selects the interface ports that match the specified number of output packets that were silently

discarded (possibly due to buffer overflow).

**[-interface-number <integer>] - Interface Number**

Selects the interface ports that match the specified interface number.

**[-unique-name <text>] - Interface Unique Name**

Selects the interface port that matches the specified unique name.

**[-display-name <text>] - Interface Display Name**

Selects the interface ports that match the specified display name.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Port Config Status**

Selects the interface ports that match the specified status.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor**

Selects the interface ports that the specified health monitor continuously monitors.

**[-switch-type {cluster-network|management-network|storage-network}] - Switch Network**

Selects the interface ports that match the specified switch type.

**[-remote-port-mtu <integer>, ...] - MTU of Remote Port**

Selects the interface ports that match the specified remote port mtu.

**[-remote-port-name <text>] - Remote Port Name**

Selects the interface ports that match the specified remote port name.

**[-remote-device <text>] - Remote Device Name**

Selects the interface ports that match the specified remote device.

**[-model <text>] - Switch Model**

Selects the interface ports that match the specified model.

**[-mac-address <text>] - MAC Address**

Selects the interface ports that match the specified mac address.

**[-vlan-id <text>] - Vlan ID**

Selects the interface ports that match the specified vlan id.

## Examples

```
cluster1::> system switch ethernet interface show
```

```
Switch: SwitchA
```

```
Opera-
```

Interface	Num-ber	Index	Type	Admin Status	tional Status	Is ISL	MTU	Duplex	Speed

```

-----
Ethernet1/  1 436207616 ethernetC up    up    no    1500 full-  40000
1           smacd                duplex

Ethernet1/ 10 436244480 ethernetC up    down  no    1500 full-  40000
10          smacd                duplex

Switch: SwitchB
Opera-

Interface  Num-  Index  Type      Admin  tional  Is
           ber  Index  Type      Status Status  ISL  MTU  Duplex Speed
-----

10

```

The example above displays the counters on switch network interfaces for all the Ethernet switches (cluster, management and storage).

## system switch ethernet log collect

Collect Ethernet switch log via openSSH.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet log collect** command initiates the collection of an Ethernet switch log for the specified Ethernet switch via OpenSSH.

Log files are removed during takeover or giveback operations.

## Parameters

**-device <text> - Switch Name**

Specifies the Ethernet switch device for which the log collection is being made.

## Examples

```
cluster1::> system switch ethernet log collect -device cluster-sw1
```

# system switch ethernet log disable-collection

Disable Ethernet switch log collection via openSSH.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet log disable-collection** command disables the collection of Ethernet switch logs via OpenSSH.

## Examples

```
cluster1::> system switch ethernet log disable-collection
```

# system switch ethernet log enable-collection

Enable Ethernet switch log collection via openSSH.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch ethernet log enable-collection` command enables the collection of Ethernet switch logs via OpenSSH.

## Examples

```
cluster1::> system switch ethernet log enable-collection
```

# system switch ethernet log modify

Modify the Ethernet switch log request.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch ethernet log modify` command modifies the log request of the specified Ethernet switch.

## Parameters

### `-device <text>` - Switch Name

Specifies the Ethernet switch device for which the log request is being made. Note: the device must be one of the devices listed as an Ethernet switch from the [system switch ethernet show](#) command. The full device name from the [system switch ethernet show](#) command must be used.

### `[-log-request {true|false}]` - Requested Log

Specifies the initiation of a switch log retrieval for the specified Ethernet switch if set to true.

## Examples

```
cluster1::> system switch ethernet log modify -device switch-name01(Switch---SN) -log  
-request true
```

Modifies the log request for the specified Ethernet switch. Setting the log-request to true initiates an Ethernet switch log retrieval for the specified switch.

## Related Links

- [system switch ethernet show](#)

# system switch ethernet log setup-password

Obtain Ethernet switch admin passwords.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet log setup-password** command allows the administrator to set up Ethernet switch health monitor access to certain Ethernet switches, so that switch logs can be collected.

## Examples

```
cluster1::> system switch ethernet log setup-password
      Enter the switch name: (use full name from system switch ethernet show)
      Enter the password: (Enter admin password of switch)
      Enter the password again: (Enter admin password of switch)
cluster1::>
```

Enables setup of switch log collection for the specified Ethernet switch.

# system switch ethernet log show

Display Ethernet switch log information.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet log show** command displays the status and requests for Ethernet switch logs.

## Parameters

{ [-fields <fieldname>, ... ] }

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ [-instance ] ] }

Specifies an instance of the Ethernet switch devices log status.

[ -device <text> ] - Switch Name

Specifies the name of the Ethernet switch device to display log status on.

**[-log-request {true|false}] - Requested Log**

Specifies the state of the log request for an Ethernet switch device. Values: true, false.

**[-log-status <text>] - Log Status**

Specifies the status of the log request for an Ethernet switch device.

**[-log-timestamp <MM/DD/YYYY HH:MM:SS>] - Log Timestamp**

Specifies the completion timestamp of the log request for an Ethernet switch device.

**[-idx <integer>] - Index**

Specifies the index of the Ethernet switch device.

**[-filename <text>] - Filename**

Specifies the full filename of the Ethernet switch log.

**[-filenode <text>] - File Node**

Specifies the name of the controller on which the Ethernet switch log resides.

## Examples

```
cluster1::> system switch ethernet log show
Log Collection Enabled: true
Index Switch                               Log Timestamp      Status
-----
  1 switch-name01(Switch---SN)             -                  -
  2 switch-name02(Switch---SN)             -                  -
```

Displays the Ethernet switches, their last log timestamp, and the status of the last log request.

# system switch ethernet polling-interval modify

Modify the polling interval for Ethernet switch health

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The **system switch ethernet polling-interval modify** command modifies the interval in which the Ethernet switch health monitor polls cluster, management and storage switches.

## Parameters

**[-polling-interval <integer>] - Polling Interval**

Specifies the interval in which the health monitor polls switches. The interval is in minutes. The default value is 5. The allowed range of values is 2 to 120.

## Examples

```
cluster1::> system switch ethernet polling-interval modify -polling-interval 41
```

Modifies the polling interval of the switches.

## system switch ethernet polling-interval show

Display the polling interval for monitoring Ethernet switch health

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet polling-interval show** command displays the polling interval used by the Ethernet switch health monitor.

## Examples

```
cluster1::> system switch ethernet polling-interval show
Polling Interval (in minutes): 40
```

The example above displays the polling interval period for the switches.

## system switch ethernet power show

Display power information for Ethernet switches (cluster, management and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet power show** command displays the power supply status of the monitored Ethernet switches.

## Parameters

**{ [-fields <fieldname>, ...]**

Selects the fields with the names that you specify.

**[ [-instance ] ] }**

Displays detailed power supply information for all the switches.

**[-device <text>] - Switch Name**

Selects the PSUs that belong to the specified switch.

**[-psu-name <text>] - Power Supply Name**

Selects the PSUs that match the specified power supply name.

**[-oper-status {operational|failed|not-operational|not-present|unknown}] - Operational Status**

Selects the PSUs that match the specified operational status.

**[-error-description <text>] - Error Description**

Selects the PSUs that match the specified error description.

**[-display-name <text>] - Power Supply Display Name**

Selects the PSUs that match the specified display name.

**[-unique-name <text>] - Power Supply Unique Name**

Selects the PSU that matches the specified unique name.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Power Supply Resource Health**

Selects the PSUs that match the specified status.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor**

Selects the PSUs that match the specified monitor type.

**[-admin-status {on|off|not-defined|unknown}] - Administrative Status**

Selects the PSUs that match the specified administrative status for the power supply.

## Examples

```
cluster1::> system switch ethernet power show
                Admin      Operational
Switch          Power Supply  Status      Status      Error
-----
SwitchA         PowerSupply-1  on          operational
SwitchA         PowerSupply-2  on          operational
```

The example above displays the power-supply status for all Ethernet switches (cluster, management and storage).

# system switch ethernet switch-count show

Display the count of cluster-network, management-network and storage-network switches.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet switch-count show** command displays the Ethernet switch redundancy status of the cluster that the Ethernet switch health monitor is monitoring.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>,...** parameter, the command displays the fields that you specify.

**[-instance ] }**

If you specify the **-instance** parameter, the command displays detailed power supply information for all the switches.

**[-unique-name <text>] - Cluster Unique Name**

Displays the cluster name whose Ethernet switch redundancy is monitored.

**[-clus-switch-count <integer>] - Ethernet Switch Count**

Displays the count of cluster network switches in the cluster.

**[-mgmt-switch-count <integer>] - Management Switch Count**

Displays the count of management network switches in the cluster.

**[-switchless-config {true|false}] - 2-Node Switchless**

Displays whether the cluster is in switchless cluster configuration or not.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor**

Displays the health monitor monitoring this cluster network switch redundancy information of the cluster.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Ethernet Switch Redundancy Status**

Displays the Ethernet switch redundancy status of the cluster.

**[-display-name <text>] - Cluster Display Name**

Displays the cluster name whose Ethernet switch redundancy is monitored.

**[-stor-switch-count <integer>] - Storage Switch Count**

Displays the count of storage network switches in the cluster.

## Examples

```
cluster1::*> system switch ethernet switch-count show
Cluster  Management Storage  Switchless
Sw Count Sw Count  Sw Count Config
-----
2        1        2        false
```

Shows the count of Ethernet switches (including cluster, management and storage networks) and the switchless configuration status of the cluster.

# system switch ethernet temperature show

Display temperature information for Ethernet switches (cluster, management and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch ethernet temperature show** command displays the temperature status of switches monitored by the Ethernet switch health monitor.

## Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-device <text>] - **Switch Name**

Selects the temperature sensors that belong to the specified switch.

[-sensor-name <text>] - **Sensor Name**

Selects the temperature sensors that match the specified temperature sensor name.

[-index <integer>] - **Sensor Index**

Selects the temperature sensors that match the specified sensor index.

**[-temperature <integer>] - Temperature in Celsius**

Selects the temperature sensors whose readings match the specified temperature value.

**[-threshold-severity {Unknown|Other|Information|Degraded|Minor|Major|Critical|Fatal}] - Threshold Severity**

Selects the temperature sensors that match the specified threshold severity.

**[-threshold-value <integer>,...] - Threshold Value**

Selects the temperature sensors that match the specified threshold value.

**[-sensor-status {normal|warning|alert|critical|not-present|not-operational|unknown}] - Temperature Status**

Selects the temperature sensors that match the specified operational status.

**[-display-name <text>] - Sensor Display Name**

Selects the temperature sensors that match the specified sensor display name.

**[-unique-name <text>] - Sensor Unique Name**

Selects the temperature sensor that matches the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor**

Selects the temperature sensors that the specified health monitor continuously monitors.

**[-error-description <text>] - Error Description**

Selects the temperature sensors that match the specified fault error description.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Resource Status**

Selects the temperature sensors that match the specified status.

## Examples

```
cluster1::> system switch ethernet temperature show
                Threshold  Threshold
Switch  Sensor      Reading Severity  Value      Status  Error
-----  -
SwitchA "Module-1, Intake-1"
                24      Minor, Major
                40, 50      normal
SwitchA "Module-1, Intake-2"
                23      Minor, Major
                40, 50      normal
```

The example above displays temperature status for all Ethernet switches (cluster, management and storage).

# system switch ethernet threshold show

Display the Ethernet switch health monitor alert thresholds

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch ethernet threshold show` command displays thresholds used by health monitor alerts.

## Examples

```
cluster1::> system switch ethernet threshold show
  Per 0.10% values: 1 = 0.10%, 5 = 0.50%
  Entity-alert Threshold is the count needed to raise entity warning alert
In Errors Threshold (%) Out Errors Threshold (%) Entity-alert Threshold
-----
                               1                               1                               2
```

Displays the inbound and outbound switch interface packet error thresholds are set at 0.1%. Also, displays threshold value for entity warning alerts. The node platform health monitor also shares the same thresholds in monitoring packet errors of cluster ports on the node.

# system switch fibre-channel add

Add a back-end fibre-channel switch for monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch fibre-channel add` command enables you to add fibre-channel (FC) switches for SNMP monitoring in a MetroCluster configuration. Front end switches should not be added for monitoring and will result in a Monitor Status Error condition.

## Parameters

**-address <IP Address> - FC Switch Management IP Address**

This parameter specifies the IP address of the back-end FC switch that is added for monitoring.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - Supported SNMP Version**

This parameter specifies the SNMP version that ONTAP uses to communicate with the back-end FC switch that is added for monitoring. The default SNMP version is SNMPv2c.

**[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username**

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch that is added for monitoring.

**[-veto-backend-fabric-check {true|false}] - Veto Back-end Fabric Check?**

If specified, the **system switch fibre-channel add** command will not check if the switch is present in the MetroCluster's back-end fabric. By default, it does not let you add switches that are not present.

**[-blades <integer>, ...] - Cisco Director Class Switch Blades to Monitor**

This parameter specifies the blades to monitor on the back-end switch that is added for monitoring. It is only applicable to director-class switches.

## Examples

The following command adds a back-end switch with IP Address 10.226.197.34 for monitoring:

```
cluster1::> system switch fibre-channel add -address 10.226.197.34 -snmp-community-or-username public
cluster1::> system switch fibre-channel show
```

Switch	Symbolic Name	Vendor	Model	Switch WWN	Is Monitored	Monitor Status
Cisco_10.226.197.34	mcc-cisco-8Gb-fab-4	Cisco	DS-C9148-16P-K9	2000547fee78f088	true	ok
mcc-cisco-8Gb-fab-1	mcc-cisco-8Gb-fab-1	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-2	mcc-cisco-8Gb-fab-2	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-3	mcc-cisco-8Gb-fab-3	Cisco	-	-	false	-

4 entries were displayed.  
cluster1::>

The following command adds a Cisco Director Class switch for monitoring. ONTAP uses SNMPv3 and 'snmpuser1' username to communicate with this switch.

```
cluster1::> system switch fibre-channel add -address 10.228.56.208 -snmp-version SNMPv3 -snmp-community-or-username snmpuser1 -blades 3,4
```

# system switch fibre-channel modify

Modify information about a back-end fibre-channel switch's configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch fibre-channel modify** command enables you to modify certain parameters for identifying and accessing the back-end fibre-channel (FC) end switches added for monitoring in a MetroCluster configuration.

## Parameters

### **-switch-name <text> - FC Switch Name**

This parameter specifies the name of the switch.

### **[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

This parameter specifies the SNMP version that ONTAP uses to communicate with the switch.

### **[-switch-ipaddress <IP Address>] - Switch IP Address**

This parameter specifies the IP address of the switch.

### **[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username**

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch.

### **[-blades <integer>, ...] - Director-Class Switch Blades to Monitor**

This parameter specifies the blades to monitor on the switch. It is only applicable to director-class switches.

## Examples

The following command modifies Cisco\_10.226.197.34 switch SNMP community to 'public':

```
cluster1::> system switch fibre-channel modify -switch-name Cisco_10.226.197.34
-switch-ipaddress 10.226.197.34 -snmp-community-or-username public
cluster1::>
```

The following command modifies the blades monitored on a director-class switch:

```
cluster1::> system switch fibre-channel modify -switch-name Cisco_10.228.56.208
-blades 3,4
cluster1::>
```

The following command modifies Brocade 6505 switch SNMP version to SNMPv3 and SNMPv3 username to 'snmpuser1':

```
cluster1::> system switch fibre-channel modify -switch-name Brocade6505 -switch
-ipaddress 10.226.197.34 -snmp-version SNMPv3 -snmp-community-or-username snmpuser1
cluster1::>
```

## system switch fibre-channel refresh

Refresh back-end fibre-channel switch info

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The **system switch fibre-channel refresh** command triggers a refresh of the SNMP data for the MetroCluster fibre-channel (FC) switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the [system switch fibre-channel add](#) and [system bridge add](#) commands, respectively.

### Examples

The following command triggers a refresh for the FC switch and FC-to-SAS bridge data:

```
cluster1::*> system switch fibre-channel refresh
cluster1::*>
```

## system switch fibre-channel remove

Remove a back-end fibre-channel switch from monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The **system switch fibre-channel remove** command enables you to remove back-end fibre-channel

(FC) switches that were previously added for SNMP monitoring.

## Parameters

### -switch-name <text> - FC Switch Name

This parameter specifies the name of the back-end FC switch added for monitoring.

## Examples

The following command removes 'Cisco\_10.226.197.34' switch from monitoring:

```
cluster1::> system switch fibre-channel show
```

Switch	Symbolic Name	Vendor	Model	Switch WWN	Is Monitored	Monitor Status
Cisco_10.226.197.34	mcc-cisco-8Gb-fab-4	Cisco	DS-C9148-16P-K9	2000547fee78f088	true	ok
mcc-cisco-8Gb-fab-1	mcc-cisco-8Gb-fab-1	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-2	mcc-cisco-8Gb-fab-2	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-3	mcc-cisco-8Gb-fab-3	Cisco	-	-	false	-

4 entries were displayed.

```
cluster1::> system switch fibre-channel remove -switch-name Cisco_10.226.197.34
cluster1::> system switch fibre-channel show
```

Switch	Symbolic Name	Vendor	Model	Switch WWN	Is Monitored	Monitor Status
mcc-cisco-8Gb-fab-4	mcc-cisco-8Gb-fab-4	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-1	mcc-cisco-8Gb-fab-1	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-2	mcc-cisco-8Gb-fab-2	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-3	mcc-cisco-8Gb-fab-3	Cisco	-	-	false	-

4 entries were displayed

```
cluster1::>
```

# system switch fibre-channel show

Display back-end fibre-channel switch information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system switch fibre-channel show** command displays information about all the back-end fibre-channel (FC) switches in the MetroCluster configuration. The back-end switches must have been previously added for monitoring using the **system switch fibre-channel add** command. If no parameters are specified, the default command displays the following information about the back-end FC switches:

- Switch
- Symbolic Name
- Vendor
- Model
- Switch WWN
- Is Monitored
- Monitor Status

To display detailed profile information about a single back-end FC switch, use the **-switch-name** parameter.

## Parameters

**{ [-fields <fieldname>, ... ]**

Displays the specified fields for all the back-end FC switches, in column-style output.

**[ [-connectivity ]**

Displays the following details about the connectivity from the back-end FC switch to connected entities:

- Port name
- Port operating mode
- Port world wide name
- Peer port world wide name
- Peer type
- Additional information about peer

Displays the following details about the connectivity from the node to the back-end FC switch:

- Node name
- Adapter name
- Switch port name
- Switch port speed
- Adapter type

#### **[ [-cooling ]**

Displays the following details about the fans and temperature sensors on the back-end FC switch:

- Fan name
- Fan speed in rotations per minute (RPM)
- Fan operational status
- Temperature sensor name
- Temperature sensor reading in Celsius °C
- Temperature sensor status

#### **[ [-error ]**

Displays the errors related to the back-end FC switch.

#### **[ [-port ]**

Displays the following details about the back-end FC switch ports:

- Port name
- Port world wide name
- Port administrative status
- Port operational status
- Port operating mode
- Whether SFP is present in the port
- Port speed in gigabits per second (Gbps)
- Port BB credit
- Peer port world wide name

#### **[ [-power ]**

Displays the following details about the back-end FC switch power supplies:

- Power supply name
- Power supply serial number
- Power supply operational status

#### **[ [-san-config ]**

Displays the following details about the Virtual Storage Area Networks (VSAN) and Zones of the

back-end FC switch:

- VSAN identifier
- VSAN name
- VSAN operational status
- Type of load balancing configured for the VSAN
- Where in-order-delivery set for the VSAN
- Whether the auto power reset of the PSU is enabled
- VAN member switch name and port
- Zone name
- VSAN ID of the zone
- Zone member switch name and port
- Zone member port id
- Zone member port world wide name

#### **[ [-sfp ]**

Displays the following details about the back-end FC switch ports small form-factor pluggable (SFP):

- Port name
- Type of SFP
- SFP transmitter type
- SFP vendor
- SFP part number
- SFP serial number

#### **[ [-stats ]**

Displays the following details about the back-end FC switch ports:

- Port name
- Frames received through the port (Rx Frames)
- Frames transmitted through the port (Tx Frames)
- Octets received through the port (Rx Octets)
- Octets transmitted through the port (Tx Octets)
- Port error frames

#### **[ [-instance ] }**

Displays expanded information about all the back-end FC switches in the system. If a back-end FC switch is specified, then this parameter displays the same detailed information for the back-end FC switch you specify as does the -switch-name parameter.

**[-switch-name <text>] - FC Switch Name**

Displays information only about the back-end FC switches that match the name you specify.

**[-switch-wwn <text>] - Switch World Wide Name**

Displays information only about the back-end FC switches that match the switch wwn you specify.

**[-switch-symbolic-name <text>] - Switch Symbolic Name**

Displays information only about the back-end FC switches that match the switch symbolic name you specify.

**[-switch-fabric-name <text>] - Fabric Name**

Displays information only about the back-end FC switches that match the switch fabric you specify.

**[-domain-id <integer>] - Switch Domain ID**

Displays information only about the back-end FC switches that match the switch domain id you specify.

**[-switch-role {unknown|primary|subordinate}] - Switch Role in Fabric**

Displays information only about the back-end FC switches that match the switch role you specify.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

Displays information only about the back-end FC switches that match the switch SNMP version you specify.

**[-switch-model <text>] - Switch Model**

Displays information only about the back-end FC switches that match the switch model you specify.

**[-switch-vendor {unknown|Brocade|Cisco}] - Switch Vendor**

Displays information only about the back-end FC switches that match the switch vendor you specify.

**[-fw-version <text>] - Switch Firmware Version**

Displays information only about the back-end FC switches that match the switch firmware version you specify.

**[-serial-number <text>] - Switch Serial Number**

Displays information only about the back-end FC switches that match the switch serial number you specify.

**[-switch-ipaddress <IP Address>] - Switch IP Address**

Displays information only about the back-end FC switches that match the switch IP address you specify.

**[-switch-status {unknown|ok|error}] - Switch Status**

Displays information only about the back-end FC switches that match the switch status you specify.

**[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username**

Displays information only about the back-end FC switches that match the switch SNMPv2c community or SNMPv3 username you specify.

**[-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Profile Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the profile data last successful refresh timestamp you specify.

**[-is-monitoring-enabled {true|false}] - Is Monitoring Enabled for Switch**

Displays information only about the back-end FC switches that match the switch monitoring value you specify.

**[-blades <integer>,...] - Director-Class Switch Blades to Monitor**

Displays information only about the back-end FC switches that match the blade value you specify.

**[-engine-id <Hex String>] - Engine ID of SNMPv3 Capable Switch**

Displays information only about the back-end FC switches that match the SNMPv3 engine-id you specify.

**[-psu-name-list <text>,...] - Switch Power Supply Name List**

Displays information only about the back-end FC switches that have the power supply units with the names you specify.

**[-psu-serial-number-list <text>,...] - Switch Power Supply Serial Number List**

Displays information only about the back-end FC switches that have the power supply units with the serial numbers you specify.

**[-psu-status-list {unknown|normal|warning|faulty|not-present}] - Switch Power Supply Status List**

Displays information only about the back-end FC switches that have the power supply units with the statuses you specify.

**[-psu-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Power Supply Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the power supply unit data last successful refresh timestamp you specify.

**[-temp-sensor-name-list <text>,...] - Switch Temperature Sensor Name List**

Displays information only about the back-end FC switches that have the temperature sensors with the names you specify.

**[-temp-sensor-reading-list <integer>,...] - Switch Temperature Sensor Reading © List**

Displays information only about the back-end FC switches that have the temperature sensors with

the readings you specify.

**[-temp-sensor-status-list {unknown|normal|warning|critical}] - Switch Temperature Sensor Status List**

Displays information only about the back-end FC switches that have the temperature sensors with the statuses you specify.

**[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm}}] - Switch Temperature Sensor Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the temperature sensor data last successful refresh timestamp you specify.

**[-fan-name-list <text>,...] - Switch Fan Name List**

Displays information only about the back-end FC switches that match the fans with the names you specify.

**[-fan-rpm-list <integer>,...] - Switch Fan Speed (RPM) List**

Displays information only about the back-end FC switches that match the fans with the RPM speeds you specify.

**[-fan-status-list {unknown|operational|failed|not-operational|not-present}] - Switch Fan Operational Status List**

Displays information only about the back-end FC switches that match the fans with the statuses you specify.

**[-fan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm}}] - Switch Fan Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the fan data last successful refresh timestamp you specify.

**[-vsan-index-list <integer>,...] - Switch VSAN Index List**

Displays information only about the back-end FC switches that have the VSANs with the indexes you specify.

**[-vsan-name-list <text>,...] - Switch VSAN Name List**

Displays information only about the back-end FC switches that have the VSANs with the names you specify.

**[-vsan-oper-status-list {up|down}] - Switch VSAN Operational Status List**

Displays information only about the back-end FC switches that have the VSANs with the operational statuses you specify.

**[-vsan-load-balancing-type-list {src-id-dest-id|src-id-dest-id-ox-id}] - Switch VSAN Load balancing Type List**

Displays information only about the back-end FC switches that have the VSANs with the load balancing types you specify.

**[-is-vsan-iod-list {true|false}] - Is In-order Delivery Set for VSAN List**

Displays information only about the back-end FC switches that have the VSANs with the IOD setting you specify.

**[-vsan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch VSAN Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the VSAN data last successful refresh timestamp you specify.

**[-member-switch-name-list <text>,...] - Member Switch List**

Displays information only about the back-end FC switches that have the VSANs with the member switch names you specify.

**[-member-switch-port-name-list <text>,...] - Member Switch Port Name List**

Displays information only about the back-end FC switches that have the VSANs with the member switch port names you specify.

**[-vsan-id-list <integer>,...] - Zone VSAN ID List**

Displays information only about the back-end FC switches that have the VSANs with the IDs you specify.

**[-zone-name-list <text>,...] - Switch Zone Name List**

Displays information only about the back-end FC switches that have the zones with the names you specify.

**[-zone-member-sw-domain-id-list <integer>,...] - Zone Member Switch Port Domain ID List**

Displays information only about the back-end FC switches that have the zones with the member switch domain ids you specify.

**[-zone-member-port-name-list <text>,...] - Zone Member Port List**

Displays information only about the back-end FC switches that have the zones with the port names you specify.

**[-zone-member-port-wwn-list <text>,...] - Zone Member WWPN List**

Displays information only about the back-end FC switches that have the zones with the port WWNs you specify.

**[-zone-member-port-switch-name-list <text>,...] - Zone Member Switch WWN List**

Displays information only about the back-end FC switches that have the zones with the member port hosting switch names you specify.

**[-zone-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Zone Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the zone data last successful refresh timestamp you specify.

**[-zone-member-wwn-list <text>,...] - Zone Member WWN List**

Displays information only about the back-end FC switches that have the zones with the member WWNs you specify.

**[-zone-member-port-id-list <text>,...] - Zone Member Port ID List**

Displays information only about the back-end FC switches that have the zones with the member port ids you specify.

**[-port-wwn-list <text>,...] - Switch Port World Wide Name (WWPN) List**

Displays information only about the back-end FC switches that have the ports with the WWNs you specify.

**[-port-name-list <text>,...] - Switch Port Name List**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**[-port-admin-status-list {unknown|enabled|disabled}] - Switch Port Admin Status List**

Displays information only about the back-end FC switches that have the ports with administrative statuses you specify.

**[-port-oper-status-list {unknown|online|offline}] - Switch Port Operational Status List**

Displays information only about the back-end FC switches that have the ports with operational statuses you specify.

**[-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port|other|EX-port|D-port|SIM-port|VE-port|AE-port|AF-port}] - Switch Port Mode List**

Displays information only about the back-end FC switches that have the ports with the operating modes you specify.

**[-port-oper-speed-list <integer>,...] - Switch Port Current Speed (in Gbits/sec) List**

Displays information only about the back-end FC switches that have the ports with the operational speeds you specify.

**[-port-bb-credit-list <integer>,...] - Switch Port BB Credit List**

Displays information only about the back-end FC switches that have the ports with the BB credits you specify.

**[-port-sfp-present-list {true|false}] - Switch Port Is SFP Present List**

Displays information only about the back-end FC switches that have the ports with the SFP present values you specify.

**[-port-peer-wwpn-list <text>,...] - Switch Port Peer WWPN List**

Displays information only about the back-end FC switches that have the ports with the peer port WWPNs you specify.

**[-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Port Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the port data last successful refresh timestamp you specify.

**[-port-stat-name-list <text>,...] - Switch Port Name List**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**[-port-tx-frames-list <integer>,...] - Switch Port Transmitted Frame Count List**

Displays information only about the back-end FC switches that have the ports with the transmitted frames values you specify.

**[-port-rx-frames-list <integer>,...] - Switch Port Received Frame Count List**

Displays information only about the back-end FC switches that have the ports with the received frames values you specify.

**[-port-tx-octets-list <integer>,...] - Switch Port Total Transmitted Octets List**

Displays information only about the back-end FC switches that have the ports with the transmitted octets values you specify.

**[-port-rx-octets-list <integer>,...] - Switch Port Total Received Octets List**

Displays information only about the back-end FC switches that have the ports with the received octets values you specify.

**[-port-frame-error-list <integer>,...] - Switch Port Frame Error Count List**

Displays information only about the back-end FC switches that have the ports with the error frame values you specify.

**[-port-stat-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port Stat Data Last Update Timestamp**

Displays information only about the back-end FC switches that match the port statistics data last successful refresh timestamp you specify.

**[-sfp-port-name-list <text>,...] - Switch Port Name List**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**[-sfp-type-list {unknown|other|gbic|embedded|glm|gbic-with-serial-id|gbic-without-serial-id|sfp-with-serial-id|sfp-without-serial-id|xfp|x2-short|x2-medium|x2-tall|xpak-short|xpak-medium|xpak-tall|xenpak|sfp-dw-dm|qsfp|x2-dw-dm|gbic-not-installed|small-form-factor}] - Switch Port SFP Type List**

Displays information only about the back-end FC switches that have the ports with the SFP types you specify.

**[-sfp-tx-type-list {unknown|long-wave-laser|short-wave-laser|long-wave-laser-cost-reduced|electrical|ten-gig-base-sr|ten-gig-base-lr|ten-gig-base-er|ten-gig-base-lx4|ten-gig-base-sw|ten-gig-base-lw|ten-gig-base-ew}] - Switch Port SFP Transmitter Type List**

Displays information only about the back-end FC switches that have the ports with the SFP transmitter types you specify.

**[-sfp-vendor-list <text>,...] - Switch Port SFP Vendor List**

Displays information only about the back-end FC switches that have the ports with the SFP vendors you specify.

**[-sfp-part-number-list <text>,...] - Switch Port SFP Part Number List**

Displays information only about the back-end FC switches that have the ports with the SFP part numbers you specify.

**[-sfp-serial-number-list <text>,...] - Switch Port SFP Serial Number List**

Displays information only about the back-end FC switches that have the ports with the SFP serial numbers you specify.

**[-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Port SFP Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the port SFP data last successful refresh timestamp you specify.

**[-switch-error-text-list <text>,...] - Switch Error Text List**

Displays information only about the back-end FC switches that have the errors you specify.

**[-conn-switch-port-name-list <text>,...] - Switch Port Name List**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**[-conn-switch-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port|other|EX-port|D-port|SIM-port|VE-port|AE-port|AF-port}] - Switch Port Operating Mode List**

Displays information only about the back-end FC switches that have the ports with the operating modes you specify.

**[-conn-switch-port-wwn-list <text>,...] - Switch Port WWN List**

Displays information only about the back-end FC switches that have the ports with the WWNs you specify.

**[-conn-switch-port-peer-port-wwn-list <text>,...] - Switch Port Peer Port WWN List**

Displays information only about the back-end FC switches that have the ports with the peer port WWNs you specify.

**[-conn-switch-port-peer-info-list <text>,...] - Switch Port Peer Host & Port Name List**

Displays information only about the back-end FC switches that have the ports with the peer information values you specify.

**[-conn-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Connectivity Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the switch connectivity data last successful refresh timestamp you specify.

---

**[-conn-switch-port-peer-type-list {unknown|bridge|switch|fcp-adapter|fcvi-adapter}] - Switch Port Peer Type List**

Displays information only about the back-end FC switches that have the ports connected to the peer types you specify.

**[-switch-port-name-list <text>,...] - Switch Port Name List**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**[-switch-port-speed-list <integer>,...] - Switch Port Speed (in Gbps) List**

Displays information only about the back-end FC switches that have the ports with the speeds you specify.

**[-node-name-list <nodename>,...] - Node Name List**

Displays information only about the back-end FC switches that are connected to the nodes you specify.

**[-adapter-name-list <text>,...] - Node Adapter Name List**

Displays information only about the back-end FC switches that are connected to the adapters you specify.

**[-adapter-port-name-list <text>,...] - Node Adapter Port Name List**

Displays information only about the back-end FC switches that are connected to the adapter ports you specify.

**[-adapter-type-list {unknown|FCP-Initiator|FC-VI|FCP-Target}] - Node Adapter Type List**

Displays information only about the back-end FC switches that are connected to the types of adapters you specify.

**[-path-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Path Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the node to switch path data last successful refresh timestamp you specify.

**[-name-list <text>,...] - Switch Name List**

Displays information only about the back-end FC switches that match the names you specify.

**[-domain-id-list <integer>,...] - Switch Domain ID List**

Displays information only about the back-end FC switches that match the domain ids you specify.

**[-wwn-list <text>,...] - Switch WWN List**

Displays information only about the back-end FC switches that match the switch WWNs you specify.

**[-role-list {unknown|primary|subordinate}] - Switch Role in Fabric List**

Displays information only about the back-end FC switches that match the switch roles you specify.

**[-address-list <IP Address>, ...] - Switch IP Address List**

Displays information only about the back-end FC switches that match the switch IP addresses you specify.

## Examples

The following example displays information about all back-end FC switches:

```
cluster::> system switch fibre-channel show
      Symbolic          Is          Monitor
Switch  Name      Vendor  Model      Switch WWN      Monitored Status
-----
Cisco_10.226.197.34

# system timeout modify

Set the CLI inactivity timeout value

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system timeout modify** command sets the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. The default value is 30 minutes. To prevent CLI sessions from timing out, specify a value of **0** (zero).

## Parameters

**[-timeout <integer>] - Timeout (in minutes)**

Use this parameter to specify the timeout value, in minutes.

## Examples

The following example shows how to modify the timeout value for CLI sessions to be 10 minutes:

```
cluster1::> system timeout modify -timeout 10
```

The following example shows how to prevent CLI sessions from timing out:

```
cluster1::> system timeout modify -timeout 0
```

## system timeout show

Display the CLI inactivity timeout value

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **system timeout show** command displays the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. A timeout value of 0 minutes means that the CLI sessions never time out.

## Examples

The following example displays the timeout value for CLI sessions:

```
cluster1::> system timeout show  
CLI session timeout: 15 minute(s)
```

## template copy

Copy a template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Use this command to copy an existing template. The copied template becomes a readwrite template and can be customized using template parameter family of commands.

## Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

**-destination-name <template name> - Destination template**

This parameter specifies the name of the destination template.

## Examples

The following example copies template1 to template2. The template2 will be a readwrite template:

```
cluster1::> template copy -name template1 -destination-name template2
```

## template delete

Delete an existing template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Use this command to delete an existing template.

## Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

## Examples

The following example deletes a template named template1 from the cluster:

```
cluster1::> template delete -name template1
```

## template download

Download a template

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

Use this command to download a template from an external server to the cluster.

## Parameters

**-uri {(ftp|http|https)://(hostname|IPv4 Address|['IPv6 Address'])...}** - URI of the template

This parameter specifies the URI from which the template will be downloaded.

**[-name <template name>]** - Name of the template

This parameter specifies the name that will be assigned to the template in the cluster.

## Examples

The following example downloads the template specified in the `-uri` parameter value and names the template as `template1`:

```
cluster1::> template download -uri http://www.example.com/netapp-templates/mysample
-name template1
```

The following example downloads the template specified in the `-uri` parameter value:

```
cluster1::> template download -uri http://www.example.com/netapp-templates/template1
```

# template provision

Provision Data ONTAP resources using the template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The command **template provision** provisions ONTAP system based on the template that is passed as an input to the template parameter. A wizard is presented which will accept the required inputs.

## Parameters

**-name <template name>** - Name of the template

This parameter specifies the name of the template

**[-simulate {true|false}]** - Simulate

If this parameter is specified, the provisioning is just simulated and there will be no changes done to the system.

## Examples

The following example provisions a vsserver with required protocols using template.

```

cluster-1::> template provision -name VserverEnvironmentSetup
Press Ctrl+C to abort.

## template rename

Rename a template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use this command to rename an existing template.

### Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

**-new-name <template name> - New name of the template**

This parameter specifies the template's new name.

### Examples

The following example renames a template template1 as template2:

```
cluster1::> template rename -name template1 -new-name template2
```

## template show-permissions

Display Template Allowed and Disallowed System Objects

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The template show-permission command shows all the system objects that are allowed and disallowed for the current user.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**[-instance ]}**

If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-name <text>] - Name**

If you specify this parameter, only permissions that match the specified name are displayed.

**[-object-name <text>] - Object Name**

If you specify this parameter, only permissions that match the specified object-name are displayed.

**[-permission <text>] - Permission**

If you specify this parameter, only permissions that match the specified permission are displayed.

**[-command-name <text>] - Command Name**

If you specify this parameter, only permissions that match the specified command-name are displayed.

## Examples

The following example shows all the the allowed and disallowed system objects

```
cluster1::> template show-permissions
Template: VserverEnvironmentSetup
Object Name          Command Name          Permission
-----
access.dns           vservice name-service dns create  allowed
network.interface    network interface create  allowed
network.routes       network route create    allowed
protocols.CIFS       vservice cifs create     allowed
```

## template show

Display templates

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **template show** command displays information about templates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, then

the command displays the following information about all the templates:

- Template Name
- Permission (**readonly** or **readwrite**)

To display detailed information about a single template, run the command with the **-name** parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Parent Template Name
- Description
- Version
- UUID of the Template

To display detailed information about all templates, run the command with the **-instance** parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about templates with **readonly** permissions, run the command with the **-permission readonly** parameter.

## Parameters

**{ [-fields <fieldname>, ... ] }**

This parameter specifies the fields that need to be displayed.

**[ -instance ] }**

If this parameter is specified, the command displays information about all entries.

**[ -name <template name> ] - Name of the template**

If this parameter is specified, the command displays the detailed information about the template that matches the specified name.

**[ -permission <template\_permission> ] - Permission**

If this parameter is specified, the command displays information about the template or templates that matches the specified permission.

**[ -parent-template <text> ] - Parent template name**

If this parameter is specified, the command displays information about the template or templates that matches the specified parent template name.

**[ -description <text> ] - Description**

If this parameter is specified, the command displays information about the template or templates that matches the specified description.

**[ -version <text> ] - Version**

If this parameter is specified, the command displays information about the template or templates that matches the specified version.

**[-uuid <UUID>] - UUID of the template**

If this parameter is specified, the command displays information about the template or templates that matches the specified uuid.

## Examples

The following example displays information about all templates in the cluster:

```
cluster1::> template show
Template                Permission
-----
template1              readonly
template2              readwrite
```

The following example displays detailed information about a template named template1:

```
cluster1::> template show -name template1
Name of the Template: template1
      Permission: readonly
Parent Template Name: -
      Description: Template to configure Vserver Environment
      Version: 1.0
UUID of the Template: c8dfef58-b5c5-5697-a829-18d4ee0ba202
```

## template upload

Upload an existing template to an external server

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

Use this command to upload an existing template on to an external server.

## Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

**-uri {(ftp|http|https)://(hostname|IPv4 Address|['IPv6 Address'])...} - URI to upload the template**

This parameter specifies the URI to which the template will be uploaded.

## Examples

The following example uploads a template `template1` on to an external server specified in the `uri` input parameter:

```
cluster1::*> template upload -name template1 -uri http://www.example.com/mytemplates/
```

# template parameter modify

Modify the template parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `template parameter modify` command can be used to modify the following attributes of a template parameter:

- Default value of the parameter

## Parameters

**-template <template name>** - Name of the template

Name of the template.

**-name <text>** - Name of the parameter

This parameter specifies the name of the parameter.

**[-default-value <text>]** - Default value of the parameter

This parameter specifies the default value of the parameter. This value is used by the [template provision](#) command when it provisions the system using this template.

## Examples

The following example modifies the default value of the parameter `param1` in template `template1` to `value1`:

```
cluster1:::> template parameter modify -template template1 -parameter param1 -default -value value1
```

Display template parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The **template parameter show** command displays information about the parameters of a template. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the parameters of all the templates in the system:

- Name of the template
- Name of the parameter
- Permission (**readonly** or **readwrite**)
- Default Value for the parameter
- Readonly
- Description

To display detailed information about a single parameter of the template run the command with the **-name** parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Recommended Value for the parameter
- Maximum Length
- Range Maximum
- Range Minimum
- Allowed Values

To display detailed information about all the parameters of the template, run the command with the **-instance** parameter

You can specify additional parameters to display information that matches only those parameters. For example, to display information about all the parameters of the templates with readonly permissions, run the command with the **-permission readonly** parameter.

## Parameters

{ [-fields <fieldname>, ...]

This parameter specifies the fields that need to be displayed.

[-instance ]}

If this parameter is specified, the command displays information about all entries.

**[-template <template name>] - Name of the template**

Name of the template.

**[-name <text>] - Name of the parameter**

If this parameter is specified, the command displays information about the parameter of all the templates that matches the specified parameter name.

**[-permission <text>] - Template permission**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified permission.

**[-type <text>] - Type of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified type.

**[-description <text>] - Parameter description**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified description.

**[-recommended-value <text>] - Recommended value of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified recommended value.

**[-default-value <text>] - Default value of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified default value.

**[-readonly {yes|no}] - Read-only parameter**

If this parameter is specified with a value of true, then all the parameters that cannot be modified of all templates are displayed. If the value specified is false, then all the parameters that can be modified of all templates are displayed.

**[-max-length <integer>] - Maximum length**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum length.

**[-range-max <integer>] - Maximum range**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum range.

**[-range-min <integer>] - Minimum range**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified minimum range.

**[-allowed-vals <text>] - Allowed values**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified allowed values.

## Examples

The following example displays information about all the parameters of all the templates in the cluster:

```
cluster1::> template parameter show
  Template: template1
  Permission: readonly
```

Parameter	Type	Default Value	Read Only	Description
parameter1	string	-	No	Parameter1
parameter2	IPAddress	-	No	Parameter2

## volume autosize

Set/Display the autosize settings of the flexible volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The **volume autosize** command allows the user to specify the maximum size that a volume automatically grows to when it is out of space or the minimum size that it shrinks to when the amount of used space is below a certain threshold. If only the volume/Vserver name is specified, then the current settings are displayed. This command is not supported on infinite volumes.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This parameter specifies the volume for which the user wants to set or display the autosize configuration.

### **{ [-maximum-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Autosize**

Use this parameter to specify the maximum size to which a flexible volume can grow. The default for flexible volumes is 120% of the volume size. If the value of this parameter is invalidated by manually growing the volume to a size more than the value of the maximum size, the maximum size is reset to 120% of the volume size. The value for **-maximum-size** cannot be set larger than the platform-dependent maximum flexible volume size. If you specify a larger value, the value of **-maximum-size** is automatically reset to the supported maximum without returning an error.

**[-minimum-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum Autosize**

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the **grow\_shrink** autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the **-minimum-size** parameter is invalidated by a manual volume resize or is invalid when autosize is enabled, the minimum size is reset to the volume size. This parameter is not supported on infinite volumes.

**[-grow-threshold-percent <percent>] - Grow Threshold Used Space Percentage**

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on infinite volumes.

**[-shrink-threshold-percent <percent>] - Shrink Threshold Used Space Percentage**

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on infinite volumes.

**[-mode {off|grow|grow\_shrink}] - Autosize Mode**

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- **off** - The volume does not grow or shrink in size in response to the amount of used space.
- **grow** - The volume will automatically grow when used space in the volume is above the grow threshold.
- **grow\_shrink** - The volume will grow or shrink in size in response to the amount of used space.

By default, **-mode** is **off** for new flexible volumes, except for data protection (DP) mirrors, for which the default value is **grow\_shrink**. The **grow** and **grow\_shrink** modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter **-space-mgmt-try-first** controls the order in which these two space reclamation policies are attempted.

**[[-reset <true>] - Autosize Reset }**

Use this option to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values based on the current size of the volume. For example, the max-autosize value is set to 120% of the current size of the volume.

## Examples

The following example sets the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1 -maximum-size 1t -mode grow
(volume autosize)
vol autosize: Flexible volume 'vs1:vol1' autosize settings UPDATED.
```

The following example shows the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1
(volume autosize)
Volume autosize is currently ON for volume 'vs1:vol1'.
The volume is set to grow to a maximum of 1t.
```

## volume create

Create a new volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The **volume create** command creates a volume on a specified Vserver and storage aggregates. You can optionally specify the following attributes for the new volume:

- Size
- State (online, offline, or restricted)
- Type (read-write or data-protection)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions.)
- Default UNIX permissions for files on the volume
- Language
- Junction path
- Whether the junction path is active (advanced privilege level or higher only)
- Whether the volume is the root volume for its Vserver (advanced privilege level or higher only)
- Comment
- Whether autosizing is enabled for FlexVols
- Maximum size for autosizing FlexVols
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled for FlexVols

- Current mode of operation of volume autosize
- Maximum directory size (advanced privilege level or higher only)
- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Snapshot reserve percentage
- Use logical space reporting
- Use logical space enforcement
- Whether the volume create operation runs as a foreground or background process
- Caching policy
- Encrypt
- File system analytics state
- Tiering object tags
- Key Manager Attribute
- SnapLock type
- Activity tracking state
- Cache retention priority
- Efficiency policy
- Tiering minimum cooling days
- Cloud retrieval policy
- Whether the volume's total number of files will be set to the highest possible value
- Application IO Size
- Preserve unlink

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be created. A volume's name must start with an alphabetic character (a to z or A to Z) and be 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other volume types. Volume names must be unique within a Vserver.

### **{ [-aggregate <aggregate name>] - Aggregate Name**

This specifies the storage aggregate on which the volume is to be created. This parameter only

applies to FlexVol volumes.

### **[`-aggr-list <aggregate name>,...`] - List of Aggregates for FlexGroup Constituents**

Specifies an array of names of aggregates to be used for FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. The root constituent will always be placed on the first aggregate in the list. An aggregate may be specified multiple times to have multiple constituents created on it. This parameter only applies to FlexGroups.

### **[`-aggr-list-multiplier <integer>`] - Aggregate List Repeat Count**

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order **aggr1 , aggr2 , aggr1 , aggr2** .

+

The default value is 4.

+

This parameter only applies to FlexGroups

### **[`-auto-provision-as <FlexGroup>`] - Automatically Provision as Volume of Type**

Use this parameter to automatically select existing aggregates for provisioning FlexGroup volumes. Note that the fastest aggregate type with at least one aggregate on each node of the cluster will be selected. When auto provisioning a FlexGroup volume, the size of the FlexGroup volume should be a minimum of 800 GB per node.

This parameter only applies to FlexGroups.

### **[`-support-tiering {true|false}`] - Automatically Provision FlexGroup on FabricPools**

This parameter specifies whether or not FabricPools are selected when provisioning a FlexGroup during the protection workflows using the `auto-provision-as` parameter. Only FabricPool aggregates are used if this parameter is set to true and only non FabricPool aggregates are used if this parameter is set to false. Tiering support for a FlexGroup can be changed by moving all of the constituents to the required aggregates. The default value is **false**

This parameter only applies to FlexGroups created using the `-auto-provision-as` parameter.

### **[`-use-mirrored-aggregates {true|false}`] - Automatically Provision FlexGroup on Mirrored Aggregates**

Use this parameter to specify whether mirrored aggregates are selected when creating a FlexGroup using the `auto-provision-as` parameter. Only mirrored aggregates are used if this parameter is set to true and only unmirrored aggregates are used if this parameter is set to false. Aggregate level mirroring for a FlexGroup can be changed by moving all of the constituents to the required aggregates. The default value is **true** for a MetroCluster configuration and is **false** for

a non-MetroCluster configuration

This parameter only applies to FlexGroups created using the **-auto-provision-as** parameter.

### **[-encryption-type {none|volume|aggregate}] - Encryption Type**

Use this parameter to specify the encryption-type while creating a FlexGroup using the **auto-provision-as** parameter. If the value is **none**, the FlexGroup created will be unencrypted. If the value is **volume**, the FlexGroup created will be of type NVE (Volume Encryption) and if the value is **aggregate**, the FlexGroup created will be of type NAE (Aggregate Encryption).

This parameter only applies to FlexGroups created using the **-auto-provision-as** parameter.

### **[-nodes {<nodename>|local}] - List of Nodes Hosting the Volume }**

Specifies an array of node names to be used for provisioning the FlexGroup. If an array of node names is specified, only aggregates from the specified nodes will be considered for provisioning. If no value is specified, all nodes in the cluster will be used.

### **[-size {<integer>[KB|MB|GB|TB|PB]]} - Volume Size**
